AppleTalk Remote Access: Don't Use at 1200 bps

==========

Article Created: 6 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Is it true that Apple doesn't recommend 1200 bps for AppleTalk Remote Access, and won't provide a 1200 bps script for that product?

DISCUSSION -----

Apple doesn't support 1200 bps because the delay is right at the threshold for timing out.

AppleShare 3.0: Maximum of 346 Open File Control Blocks

Revised: 5/8/92
Security: Everyone

AppleShare 3.0: Maximum of 346 Open File Control Blocks

==========

Article Created: 13 December 1991
Article Last Reviewed: 20 April 1992
Article Last Updated: 20 April 1992

TOPIC ----------

AppleShare 2.0.1 limits the maximum number of opened File Control Blocks (FCBs) to 160. This is a problem with some multiuser databases (such as FoxBASE). They open a file for every related database for each user accessing the database from the file server. To allow the maximum number of FCBs, the server had to have a 68O20 or a 68030 processor and have 8MB of RAM.

Does AppleShare 3.0 increase the maximum number of FCBs allowed on the file server? What is the new maximum number of FCBs? Do the same answers apply to File Sharing?

DISCUSSION ----------

AppleShare 3.0's limit is the limit on the number of simultaneous open files under HFS. This is 346 files for both AppleShare and File Sharing.

AppleTalk Remote Access: Uses Portions of Comm Toolbox

Revised: 2/4/92
Security: Everyone

AppleTalk Remote Access: Uses Portions of Comm Toolbox

==========

Article Created: 13 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I understand that AppleTalk Remote Access doesn't use the Comm Toolbox because of speed issues. Is it possible to change AppleTalk Remote so that it recognizes the extra ports Comm Toolbox allows access to? I noticed that in the "Remote Access Setup" CDEV that I can see the extra ports, but can't select them. Could you allow the user to select these serial ports? If not, the extra ports should be hidden.

DISCUSSION -----

AppleTalk Remote Access does use portions of the Comm Toolbox. At least one serial card was tested with AppleTalk Remote Access that allows you to select the serial ports on the card. The card is the QuadraLink from Applied Engineering.

PowerBook: Lightning Bolt in Battery Desk Accessory (7/92)

Revised: 5/16/94
Security: Everyone

PowerBook: "Lightning Bolt" in Battery Desk Accessory (7/92)

==========

Article Created: 12 November 1991
AArticle Reviewed/Updated: 31 July 1992

TOPIC ----------

What's the meaning of the lightning bolt icon on the PowerBook Battery DA?

DISCUSSION ----------

The PowerBook User's Guide states (page 95) that "A lightning bolt icon appears in the Battery desk accessory when the power adapter is plugged in." This is not always true. There are two cases where the lightning bolt icon appears in the Battery DA:

- The lightning bolt should appear in the Battery DA only when the power adapter is plugged in and the computer is in bulk charge. If the power adaptor is inserted, but the computer is in trickle charge, the bolt should NOT show up.

  Bulk charge is when the battery is charged from 0 to 80%, and trickle charge is when the battery is charged from 80 to 100%.

- The other time the lightning bolt will show up is when the power adaptor is plugged into the PowerBook, but not plugged into a wall outlet. The icon will remain present in the Battery DA for up to 2 hours.

An easy way to tell whether or not the power adaptor is actually charging the battery is to look at the Battery DA when the adaptor is plugged into the PowerBook. The battery indicator will drop as many as three positions when the adaptor is first plugged into the PowerBook. If the adaptor is plugged into a wall outlet and charging the battery, the indicator will move back up to the level it was before the adaptor was plugged in within about 15 seconds. If the adaptor isn't plugged into a wall outlet or isn't charging the battery, the indicator won't move back up to the level it was before the adaptor was plugged in.

StyleWriter Driver 7.2.2: Description

==========

Article Created: 13 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Apple StyleWriter driver software, version 7.2.2, as well as the fonts that are included with it.

DISCUSSION ----------

Version 1.2 of the Apple StyleWriter software upgrade includes a new StyleWriter printer driver, version 7.2.2. It is designed to allow printing up to three times faster than the previous version. In addition, Apple will begin shipping seven new TrueType font families (22 individual typefaces) with the StyleWriter. The new software and fonts are fully compatible with System 7.

The StyleWriter can take as little as one third the time to print as previously needed. This speed improvement, plus the additional fonts and the StyleWriter's background printing capability (announced August 1991), provides new convenience for StyleWriter owners.

The new TrueType fonts bring the StyleWriter total to fifteen font families, or 39 individual typefaces, which can be smoothly scaled to any size on the printed page or screen. The fonts are:

- Chicago
- Courier
- Geneva
- Helvetica
- Helvetica Narrow
- ITC Avant Garde
- ITC Bookman
- ITC Zapf Chancery
- ITC Zapf Dingbats

- Monaco
- New Century Schoolbook
- New York
- Palatino
- Symbol
- Times

QuickTime: Hardware Products Will Have QuickTime Component

==========

Article Created: 3 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Will hardware vendors provide QuickTime components with their products?

DISCUSSION -----

Many companies with hardware products such as video boards, video laser discs, VCRs, compressor boards, and so on, will provide QuickTime components (drivers meeting QuickTime's API specifications). These components provide QuickTime with the code needed to control the device. To some extent, this is similar to how the AppleTalk Manager needn't "know" how to interact with a specific hardware layer because the Link Access Protocol (LAP), and sometimes AppleTalk Address Resolution Protocol (AARP) layers handle it.

Just as AppleTalk programmers aren't concerned with the details of sending and receiving packets over LocalTalk, Ethernet, Token Ring, and so on, software that supports QuickTime isn't concerned with the details of controlling a Sony EVO 9650 Hi8 Edit VCR, or a Truevision NuVista+ video board. These applications only have to know that they're interacting with devices having certain functional characteristics. Some examples of those characteristics include:

- Playing a video segment, stopping, pausing, putting in fast forward or fast rewind mode, and possessing addressable frames.

- Capturing frames (single or sequence).

- Supporting actions such as fade in, fade out, chroma-keying, and so on.

Although all of this information relates to video and video equipment,

please note that QuickTime isn't limited to video and/or audio applications. Controlled devices could include scientific and manufacturing equipment.

The important thing to remember about QuickTime is that it is a developer-level technology. It provides software developers with a high-level API for dealing with time-dependent data and devices. It also provides a flexible file format for storing time-dependant data.

QuickTime: Computer Speed Affects Playback (8/94)

Revised: 8/19/94
Security: Everyone

QuickTime: Computer Speed Affects Playback (8/94)

==========

Article Created: 23 December 1991
Article Reviewed/Updated: 19 August 1994

TOPIC ----------

We've noticed with QuickTime a wide disparity of playback caused by dropping of video frames to remain synchronized with sound when moving from one computer to another. Only when we get to Macintosh IIfx speeds do we seem to maintain frame integrity.

DISCUSSION ----------

The QuickTime engineers deliberately designed QuickTime to do exactly what you describe. Each computer has limitations of how many instructions it can process in a given amount of time. For QuickTime, this imposes certain performance limitations.

When performance needs exceed performance limitations, adjustments must be made to preserve timing and synchronization. When playing a movie with one or more video and audio tracks, QuickTime drops video frames to preserve timing and synchronization. This solution is much less damaging to the presentation than dropping audio segments.

There are several factors that contribute to the performance that you observe when playing QuickTime movies. Some of them are:

- The CPU (68020, 68030, 68040, or PowerPC) and its clock speed

- The number of tracks played at one time

- The precision of the data within each track (examples: bits/pixel, pits/audio sample)

- The background processes that run at playback time (examples: VBL tasks, drivers, file sharing, and so on)

- AppleTalk network traffic. (Each Macintosh partially inspects EVERY packet that comes by to determine whether the packet was addressed to it.)

Article Change History:
19 Aug 1994 - Revised to show that QuickTime requires 68020 computer or better.

QuickTime: Writing a Compressor/Decompressor

Revised: 1/22/92
Security: Everyone

QuickTime: Writing a Compressor/Decompressor

==========

Article Created: 23 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Does the QuickTime architecture (specifically PICTCompressor) support/import/export TIFF or TARGA images? I need to work with these files in addition to PICT file format, and would like to see the current compression ratios under QuickTime.

Could a TIFF or TARGA Compressor be written using the QuickTime Toolbox, or is it PICT specific?

DISCUSSION -----

One of the benefits of QuickTime is that it was designed to be a very open-ended developer technology. So when you ask if QuickTime is PICT specific, the answer is a strong NO. However, any given compressor/decompressor (CoDec) component will usually be specific to a specific data format such as PICT, TIFF, TARGA, and so on. You could write a TIFF or TARGA CoDec, provided you have the expertise to do so.

QuickTime: Application Can Choose Sound Track, or Choose None

==========

Article Created: 23 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Can I turn off the sound as something plays back?

DISCUSSION ----------

Each QuickTime movie file can have any number of tracks within the file. When the file is played, the application software explicitly "tells" QuickTime which tracks to play. For example, you could have a movie file with one video track and one audio track for English narration, one audio track for Spanish, another for German, and so on.

On playback, the application could check to see what language the System is in, and play only the appropriate audio track. The application could also play NO audio tracks if desired. This functionality is an application feature; QuickTime just offers the support for achieving it.

Apple Keyboard II: How It Differs from Previous Apple Keyboard

Revised: 2/4/92
Security: Everyone

Apple Keyboard II: How It Differs from Previous Apple Keyboard

==========

Article Created: 13 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

The Apple Keyboard II (M0487LL/A) replaces the stand-alone Apple Keyboard (M0116). This article describes the differences between them.

DISCUSSION -----

The Apple Keyboard II, which has been shipping with the Macintosh Classic and Macintosh LC, is fully ANSI and ISO compliant.

New Key Layout

Several keys were relocated. The caps lock and control key exchanged places. The tilde key is now where the escape key was. The vertical line key was moved to a new location above the new return key, and the escape key took the vertical line's old spot. The return key was made smaller, and the space bar was enlarged.

The international ISO version has a new key with ± and § characters and the escape key replaced the right-hand side command key. The space bar was enlarged.

Both keyboard's numeric keypads have the + and - keys reversed. It is the same as the extended keyboard. In addition, this is the same arrangement as a 10-key adding machine.

With the exception of the arrow and escape keys, Apple Keyboard II has a layout which is identical to the comparable parts of the Apple Extended Keyboard II.

Tilt Legs

At the ends on the back, the keyboard has two legs the user can extend to provide a greater tilt.

PowerBook: Making Cable Connections While In Sleep Mode (3/95)

Revised: 3/29/95
Security: Everyone

PowerBook: Making Cable Connections While In Sleep Mode (3/95)

==========

Article Created: 23 December 1991
Article Reviewed/Updated: 29 March 1995

TOPIC ----------

Is it safe to make cable connections, such as ADB, Serial, SCSI, or SCSI Disk Mode, to a PowerBook when it is in Sleep mode?

DISCUSSION ----------

ADB

It is safe to make ADB connections to a PowerBook when in Sleep mode.

Serial

It is safe to make a serial connection to a PowerBook when in Sleep mode though it may require a restart to recognize the device.

SCSI

It is safe to make SCSI connections to a PowerBook when in sleep mode. However, you may need to restart the PowerBook or use a utility such as SCSI Probe to force the PowerBook to recognize the device.

SCSI Disk Mode

If you accidentally connect the SCSI disk adapter to a PowerBook while it's in sleep mode, you'll get a warning dialog box when you wake it.

You must first turn off the PowerBook when connecting the SCSI disk adapter. The SCSI disk mode firmware is only executed from a cold start. NOTE: All PowerBook models support SCSI Disk Mode with the exception of the PowerBook 140, 145, 150, and 170.

If you connect the cable while the system is in sleep mode, there will be

conflicting SCSI IDs on the bus and potential data loss. There are two methods to exit this state:

-You can shut down the system by pressing the reset and interrupt (programmer's) switch

-If there's data in RAM that you need to save, you can disconnect the SCSI disk adapter to resume normal operations (that is, the dialog box will go away).

Note: The PowerBook 100 User's Manual incorrectly advises the user to shut down the system using the Shut Down command from the Special menu. It is not possible to do this since the menu bar is disabled when the warning dialog box is showing.

Article Change History
29 Mar 1995 - Updated to include all cable connections to PowerBook.
18 May 1994 - Clarified PowerBooks which do NOT support SCSI disk mode.
30 Jun 1993 - Updated to include all PowerBook models to date.

PowerBook 100: Deactivate AppleTalk if Modem Uses Printer Port

Revised: 5/16/94
Security: Everyone

PowerBook 100: Deactivate AppleTalk if Modem Uses Printer Port

==========

Article Created: 23 December 1991
Article Reviewed/Updated: 3 August 1992

TOPIC ----------

You can use the printer port to connect an external modem. However, remember to deactivate AppleTalk in the Chooser before using the external modem.

DISCUSSION ----------

You may use the PowerBook 100 printer port to connect to a printer or LocalTalk network, and also to add external serial devices such as a modem. However, when disconnecting from a LocalTalk network and connecting a device like an external modem, be sure to deactivate AppleTalk in the Chooser. If you don't, you'll typically get some kind of serial port error message.

PowerBook 100: RAM Expansion Card Compatibility 8/92

==========

Article Created: 23 December 1991
Article Reviewed/Updated: 3 August 1992

TOPIC ----------

What memory cards can I use in the PowerBook 100?

DISCUSSION ----------

You can use Apple PowerBook memory cards (2MB or 4MB cards) in any of the Macintosh PowerBooks.

However, third party cards designed for the Macintosh PowerBook 140 and 170 are not necessarily compatible with the PowerBook 100 because the 68000 has a 16-bit data path, whereas the 68030 can handle 32 bits. The PowerBook 100 requires additional signal lines on the memory card to do addressing correctly. In addition, the physical form factor may not be the same.

System 7 Tune-Up 1.1.1 Feature Summary (7/93)

Revised: 7/9/93
Security: Everyone

System 7 Tune-Up 1.1.1 Feature Summary (7/93)

==========

Article Created: 13 January 1992

Article Change History

07/08/93 - REVISED and RETITLED
- Title changed to version 1.1.1 and information from similar articles added to the discussion.

09/24/92 - REVIEWED
- For technical accuracy.

TOPIC

This article describes the changes made to System 7 with Tune-Up.

DISCUSSION

This version of System 7 Tune-Up addresses the problem of disappearing files and folders reported by some users running version 7.0 and 7.0.1. It also includes LaserWriter driver version 7.1.1.

LaserWriter 7.1.1 driver provides the following benefits:

- Support for the Personal LaserWriter NTR
- It fixes the bug that causes a compatibility problem between the current driver (7.1) and the LaserWriter Plus.
- A workaround for a bug in the LaserWriter IIf and IIg ROM that causes PostScript errors (under certain conditions) when printing TrueType.

Improved System Behavior In Low Memory Situations

- Fewer Memory Size Alerts

When you open an application, if the available memory is less than the application prefers, but more than its minimum requirement, the application will use the available memory. Memory size alerts such as "Application prefers 1024K of memory, 900K is available, do you want to open using available memory?" won't appear.

- Closed Applications Quit Automatically When More Memory Is Needed
  Users commonly get into low memory situations by closing a document window without quitting the application, letting the application remain in memory. With the System 7 Tune-Up installed, the Finder offers to quit such applications automatically to make enough memory available when opening another application.

- Automatic Printing Without Quitting The Application
  This helps when you choose "Print…" with background printing on, and there isn't enough memory available to use PrintMonitor. System 7 Tune-Up will print the document immediately, without making you quit the application.

- Reduced System Software Memory Consumption When AppleTalk Is Off
  If you turn off AppleTalk with the Chooser and then restart, AppleTalk networking code won't be loaded into system memory. This frees up 100K to 125K, depending on the Macintosh model. If AppleTalk is turned on again with the Chooser, you must restart to use networking services.

- Reduced System Software Memory Fragmentation
  As you open applications, desk accessories, and control panels, the amount of memory used by system software increases. Problems in the System 7.0 and 7.0.1 Memory and Process managers prevent some of that memory from being released when those programs quit. System 7 Tune-Up fixes those problems, so more memory is released when applications and desk accessories quit.

Performance Enhancements

- Faster LaserWriter Performance When Printing TrueType Fonts
  LaserWriter driver version 7.1 doesn't download software or fonts to the LaserWriter IIf, IIg, IINT, and IINTX if the software or fonts are already in the printer's ROM. This speeds printing of both TrueType and Type 1 fonts. It also doesn't download TrueType software and fonts to the LaserWriter and LaserWriter Plus. Instead, it converts TrueType fonts to Type 1 format and downloads those.

- Faster StyleWriter Performance
  StyleWriter driver version 7.2.2 is nearly twice as fast as version 7.1, because it was rewritten based on the Personal LaserWriter LS driver rather than the ImageWriter driver. Now StyleWriter users need the MS Word TrueType Printer INIT from Microsoft to print Microsoft Word documents correctly on the StyleWriter printer.

- Better Font Memory Management
  TrueType software uses an area of system software memory to store the most recently used font images. System 7.0 and 7.0.1 clears this area

out whenever any new file is opened. TrueType must then refill this memory, slowing performance (especially when printing). With the System 7 Tune-Up, the system clears this memory area only when a new font file is opened, increasing font performance in general and TrueType printing in particular.

- Faster Chooser Performance
  Chooser 7.1 displays device names faster. Keyboard shortcuts in the Chooser also select devices more quickly. Improvements are most noticeable in network zones with many devices.

- Faster Finder Copying Of Large Files
  System 7 Tune-Up improves the performance of Finder "move" and "duplicate" operations by up to 20% on files over 200K.

Bug Fixes

- Reduced Possibility Of Data Corruption With Shared Files
  A problem in System 7.0 and 7.0.1 makes it possible for File Sharing files to become corrupted when two or more users access the file simultaneously. File Sharing Extension 7.0.2 fixes this problem.

- Increased PrintMonitor Reliability
  System 7 Tune-Up makes Print Monitor more reliable and much less prone to crashes.

- Bitmapped Fonts In the System File Marked As Purgeable
  System 7 Tune-Up allows the Font Manager to unload certain fonts in the System 7.0 System File from system software memory when not in use.

- Aliases to the Trash
  System 7 Tune-Up fixes occasional strange behavior of aliases to the Trash.

- SCSI Manager
  With System 7.0 and 7.0.1, using serial communications devices during heavy File Sharing activity can cause the SCSI bus to become confused and seem busy when the bus is free. This causes the computer to hang. System 7 Tune-Up fixes this problem.

- Sleeping Keyboard
  At startup, the System 7 Tune-Up repeatedly resets Apple Desktop Bus keyboards, preventing a problem in which some keyboards occasionally fail to wake up. System 7.0.1 includes this fix as well.

Apple 16-Inch Color Display: Compatibility

Revised: 1/22/92
Security: Everyone

Apple 16-Inch Color Display: Compatibility

==========

Article Created: 15 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

The Apple 16-inch Color Display works with Quadra 700 and 900 internal video. Other Macintosh II systems require a display card.

DISCUSSION ----------

Quadra Built-in Video

The Quadra 700 and 900 built-in video provides 256 colors in the base configuration, and 16.7 million colors with expanded VRAM.

Display Cards

The Apple 16-inch Color Display works with the Macintosh Display Cards 8•24 and 8•24 GC, version B or later. (If you have one of these cards and it's earlier than version B, you can have the ROMs upgraded.)

The number of colors provided by the Macintosh Display Cards are as follows:

Macintosh Display Card 8•24	256 colors
Macintosh Display Card 8•24 GC	32,000 colors

Macintosh 16-Inch Color Display: Description (Discontinued)

Revised: 6/20/94
Security: Everyone

Macintosh 16-Inch Color Display: Description (Discontinued)

==========

Article Created: 15 January 1992
Article Reviewed/Updated: 1 January 1994

TOPIC ----------

This document describes the Macintosh 16-inch Color Display.

DISCUSSION ----------

The Macintosh 16-Inch Color Display delivers a sharply focused picture identical in quality to the Apple 13-inch Color Display.

Feature Set

- 16-inch landscape Trinitron display

- .26mm horizontal stripe pitch

- 832 horizontal pixels by 624 vertical lines (over 500,000 pixels)

- 70% more area than 13-inch displays

- 70 dots per inch

- Horizontal scan rate 50 kHz

- Vertical refresh rate 75 Hz

- Automatic degaussing on startup

- Excellent ergonomic design

- Two ADB ports for keyboard and mouse

- Sound In/Out ports for microphone and headphone (or speaker)

- Anti-glare screen

- Vertically and horizontally pivoting base

- Meets Swedish recommendation for low frequency magnetic and electric field emissions.

Uniform Brightness

Traditional CRT technology has limitations that cause many large-screen color monitors to show uneven brightness across the screen. Variable screen brightness degrades the image quality and causes eye fatigue.

The Apple 16-inch Color Display uses a CRT design that provides uniform brightness across the entire screen. All parts of the screen show the same vivid colors. There is no degradation between the center of the screen and the edges.

Degaussing

The Apple 16-Inch Color Display provides automatic degaussing, on power up, ensuring that you always have the best image possible on your screen. Color display technology uses magnetic fields to guide electron beams inside the CRT to the screen. If a foreign magnetic field comes close to the CRT, it may disturb the internal magnetic field and cause the beams to be slightly misdirected, which distorts the screen image.

The display has circuitry, activated during startup, that compensates for the distortions by adjusting the internal magnetic field to counteract the external magnetic field. If the external magnetic field changes enough during operation to distort the screen image, the image remains distorted until the display's power is turned off and on again.

Adjustable White Point Color Temperature

The white point color temperature is a measure, in degrees Kelvin, of a display's white. Traditional displays use a 9300 degree K white, which has a bluish tint and a high contrast. A 6500 degree K white is similar to page white and is more useful for color matching.

The Apple 16-inch Color Display features an adjustable white point color temperature. You can adjust the white point color temperature by selecting the monitor's control panel and clicking on the option button while holding down the option key. The options dialog offers a choice of gamma tables, and among them are the "Mac Std Gamma" and "Page- White Gamma." The "Mac Std Gamma" is the 9300 degree K option that is the traditional bluish display white. The "Page-White Gamma" is the 6500 degree K white that closely resembles the white of a printed page.

Ergonomics

The Apple 16-inch Color Display has several ergonomic features that provide optimum flexibility for viewing comfort and ease of use.

- High-contrast glass with antiglare, antistatic coating

- The built-in tilt and swivel base makes it easy to change your viewing angle.

- A 75 hertz screen refresh rate eliminates any flickering on your screen.

- The easily accessible ADB and sound I/O ports on the side and front of the base offer flexibility for arranging your system's components.

- Power, brightness, and contrast controls on the front of the monitor make it easy to cycle power and make adjustments.

Macintosh Communications Toolbox: Software That Uses It (11/94)

Revised: 11/11/94
Security: Everyone

Macintosh Communications Toolbox: Software That Uses It (11/94)

==========

Article Created: 2 January 1991
Article Reviewed/Updated: 11 November 1994

TOPIC ----------

We want an application that uses the Communications Toolbox. We've considered MicroPhone and HyperCard. Do you know if the Macintosh Communications Toolbox works with MPW C? Will it work with any other development environments particularly well?

DISCUSSION ----------

Applications

Many applications that use the Communication Toolbox are available. Terminal emulator programs such as PacerTerm and VersaTerm-Pro use the Communications Toolbox. Software Ventures told us that the current MicroPhone II v3.0 doesn't support the Communications Toolbox. The future release (v4.0) will support the Communications Toolbox Connection Manager.

HyperCard

For HyperCard development, APDA has the HyperCard Macintosh Communications Toolbox Toolkit v1.0b2. This toolkit contains everything you need to access the facilities of the Communications Toolbox from HyperCard. In addition to the external commands (XCMDs) and external functions (XFCNs), the toolkit provides a complete set of documentation, and the full source code for the XCMDs and XFCNs.

NOTE: This product is compatible with HyperCard 2.0, with one known exception. When you open a window, the second window can't open any larger than the first window because of the way both applications allocate memory. This is the only known incompatibility. This is a restricted product. Please call APDA for more information.

MPW

MPW 3.0 and later development platforms support the Macintosh Communications Toolbox. MPW 3.2 supports the Macintosh Communications Toolbox interface files for System 7 and includes the Communications Tools Scripting Interfaces. You can also use third-party platforms that convert MPW interface files and object files.

To locate a vendor's address and phone number, use the vendor's name as a search string in the Tech Info Library.

KanjiTalk: Printing to StyleWriter

Revised: 9/22/92
Security: Everyone

KanjiTalk: Printing to StyleWriter

==========

Article Created: 9 January 1992

Article Change History

09/22/92 - UPDATED
- To include information on Kanji TrueType.

TOPIC ----------

Can I print Kanji to a StyleWriter using a Macintosh Classic with 2MB or 4MB RAM, KanjiTalk system software, and a serial connection to a StyleWriter?

Specifically:

1) Can I print Kanji and Roman characters on the StyleWriter?

2) Will the quality be bitmapped (72 dpi) or TrueType (300+ dpi)?

3) Is this possible and/or practical on a 2MB Classic?

DISCUSSION ----------

1) Yes, you can print Kanji and Roman characters on the StyleWriter.

2) Without an outline font technology, such as Kanji TrueType, The output isn't pretty due to bitmap fonts (Adobe's ATM-J can help improve the output). Kanji TrueType, is also available in the U.S. through KanjiTalk authorized dealers.

3) A Macintosh Classic with 2MB RAM is fine for the current release of KanjiTalk, 6.0.7. However, you will need 4MB if you install Kanji TrueType or ATM-J.

For a list of authorized KanjiTalk dealers in the U. S, search the Tech Info Library under "KanjiTalk and dealers", or contact the Apple Dealer Location Operator at 800-538-9696.

Data Access Manager (DAM): How It's Used

Revised: 6/29/92
Security: Everyone

Data Access Manager (DAM): How It's Used

==========

Article Created: 13 January 1992
Article Last Reviewed: 29 June 1992
Article Last Updated:

TOPIC ----------

I have the following questions about DAM:

1) How does DAM differ from DAL? How is it implemented?

2) Can in-house developers use it?

3) Are there ways of implementing it within HyperCard front ends?

4) I thought that DAM in System 7 applications talked to DAL. Is that correct?

DISCUSSION ----------

1) You'll need to refer to Inside Macintosh, Volume VI, Chapter 8 for detailed information. This subject was covered thoroughly and takes up almost 75 pages, so we won't try to cover it in detail here.

2) Data Access Manager allows your application to communicate with a database or other data source even if you don't generally know about databases or the specific data source your software users communicate with.

   All your application needs is a few high-level Data Access Manager functions and access to a file called a query document. The query document, provided by another application, contains commands and data in the format appropriate for the database or other data source. If your application can create commands for a remote data server, then it can use low-level routines to send these commands and data directly to the data server. An example of a data server is the Data Access Language

Server, which understands the command language called Data Access Language (DAL).

In-house developers can use Data Access Manager for their applications to access data in other applications, or they can write a query document for other applications to use. Again, detailed information and sample code is in Inside Macintosh, Volume VI.

3) Through HyperCard XCMDs and XFCNs, you can create HyperCard front-end applications that communicate to the low-level interface of Data Access Manager.

4) DAM is in System 7, not the applications. Both the high-level and low-level interfaces talk to DAL in a form of a database extension. This is the DAL extension installed with System 7. If you Get Info on it, you'll see it as a "database extension." Of course, DAM can talk to other database extensions. According to Inside Macintosh, the program containing the data need not be a database. With the appropriate database extensions, your application could read data from a spreadsheet, or any other program that stores data.

LaserWriter IIg: PATHWORKS 1.0 Compatibility (7/93)

Revised: 7/21/93
Security: Everyone

LaserWriter IIg: PATHWORKS 1.0 Compatibility (7/93)

==========

Article Created: 13 January 1992
Article Reviewed/Updated: 21 July 1993

TOPIC ----------

We're evaluating the LaserWriter IIg and comparing it to similar offerings from HP and QMS. We've successfully tested the IIg over LocalTalk and Ethernet, but the IIg fails to work in a particular serial configuration in which the QMS and the HP work fine. We're using PATHWORKS 1.0 with the IIg connected serially to one of DEC's terminal servers.

DISCUSSION ----------

There was a problem when printing to a LaserWriter IIg with PATHWORKS 1.0. DEC has informed us this problem was been fixed with the release of PATHWORKS 1.1, and also that the LaserWriter IIg is supported with release 1.2 as well.

Article Change History:

MacTerminal and Macintosh-to-VAX Connectivity

Revised: 2/3/92
Security: Everyone

MacTerminal and Macintosh-to-VAX Connectivity

==========

Article Created: 5 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I need to connect approximately 300 Macintosh workstations (on LocalTalk) to a VAX/VMS system using FastPath 5 routers. Only 50 or so simultaneous sessions need be supported. I am looking for software that will allow this to happen.

Currently, all the Macintosh computers have MacTerminal 3.0 and are accessing through a serial connection. I would like to retain the substantial investment we have in MacTerminal.

A product like TSSnet sounds like it will do the job. Are there comparable products that do not include a terminal emulation package (as TSSnet does)?

DISCUSSION ----------

There are many options to connect Macintosh computers on LocalTalk to a VAX. However, since you already own MacTerminal 3.0 and want to retain that investment, this list narrows down a bit. One option is software from Synergy described here:

VersaTermServer is a Macintosh CommToolBox-based application which allows any Macintosh to act as terminal server. It supports 24 output ports, and two different input methods. Inputs can be AppleTalk ADSP Tool over LocalTalk, VersaTerm Telnet Tool over Ethernet, and Apple Modem Tool over serial line. Outputs can be LAT Tool to VAX hosts, Telnet Tool to UNIX hosts, or Modem and Serial Tools. Your Macintosh computers on LocalTalk can use the AppleTalk ADSP Tool to the VersaTermServer, and then LAT from the Server to the VAX. Each supports 24 output ports so you will need two servers running.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Security: Everyone

DAL for MVS/VTAM: SNA•ps Over Token Ring

==========

Article Created: 16 December 1991
Article Last Reviewed: 30 June 1992
Article Last Updated: 30 June 1992

TOPIC ----------

We run SNA•ps over a Token Ring connection to an MVS/VTAM host. We'd like a DAL Server for MVS/VTAM to access through the Token Ring network with LU6.2 protocols (APPC).

Will the Token Ring connection work for DAL access with SNA•ps to an MVS/VTAM environment?

DISCUSSION ----------

DAL engineering lab is using this exact configuration, and it should work. We recommend defining a larger RU size in the Mode Table Entry so you can send a larger block size. You should be using SNA•ps version 1.0.1 or later. See the member README in the DAL.RUN.JCL library on the installation tape for additional information.

Direct-To-1: Translation Between All-in-1 and MacWrite

==========

Article Created: 16 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

We're running a VAX-based server with PCs and terminals, and plan to add Macintosh clients. We communicate worldwide over a VAX network using All-in-1 mail and word processors. We're considering PATHWORKS for Macintosh to turn the VAX into a server for the Macintosh.

One of our major requirements is to download All-in-1 documents to use in a Macintosh word processor such as MacWrite. After some tailoring with MacWrite, we need to load the document back to the VAX as an All-in-1 document.

I understand MacLink Plus/Translators from Dataviz contain a translator called WPS-Plus VMS. Will this translator work between an All-in-1 and MacWrite document?

DISCUSSION ----------

Digital confirmed that WPS-Plus format is different and the translator won't work with All-in-1.

We found the following product information:

Direct-To-1 allows users to send Macintosh files to other All-In-1 users with a Macintosh 512KE or later; Reflection V3.4 or later; Digital VAX All-In-1.

Direct-To-1 is a utility for the Digital VAX that allows Reflection users to send Macintosh files to other All-In-1 users. When used with Walker Richer & Quinn's Reflection 2 for the Macintosh, users can send a variety of file formats over any supported asynchronous or network connection to

a VAX host. Direct-To-1 offers convenience and security features that make All-In-1 a effective communications tool for business users.

DAL: No Record Size Limit

Revised: 6/29/92
Security: Everyone

DAL: No Record Size Limit

==========

Article Created: 19 December 1991
Article Last Reviewed: 29 June 1992
Article Last Updated:

TOPIC ----------

What is the byte limit for the length of a variable-byte-length record in DAL? Where can I get answers to similar questions?

RESPONSE ----------

There is no limit to the size of record support by the DAL server. VARCHAR data types (as with a column of type VARCHAR) can be of any length. However, DAL can't return to the DAL client a VARCHAR larger than 255 characters. Using the @substr function, you can return a very large VARCHAR in several substrings.

This information isn't in the current manuals. For similar questions, refer to the DAL Programmer's Reference, or the DAL Application Developer's Guide.

MacTerminal 3.0: 3278 Terminal Emulation Tool

==========

Article Created: 20 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have MacTerminal 3.0, and want to connect, via coax, to a 3174 controller in the building. MacTerminal 2.3 and its built-in 3278 emulation did this easily in the past.

Can I get 3270 terminal and connection tools and, simply by adding them to "vanilla" MacTerminal, get my 3270 access?

DISCUSSION ----------

The only Tool we are aware of is asc3270 from Advanced Software Concepts, which offers 3270 terminal emulation via the CommToolBox. Currently, it only supports telnet connections over TCP/IP using their TCP/IP connection Tool called TCPack.

Since you already have coax to a 3174 controller, SNA•ps is a better solution since it provides better keyboard mapping and terminal emulation. If you insist on using MacTerminal, you will have to wait for the SNA connection Tool from Advanced Software Concepts.

Other 3270 connection solutions are also available in the Technical Info Library. Search using keyword "Macintosh and 3270."

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

LaserWriter IIf: Needs 4MB RAM to Print All Page Sizes

==========

Article Created: 20 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC -----

The manual for the LaserWriter IIf and LaserWriter IIg states that there is a non-printable margin around the page of 5mm. All of the LaserWriter IIf printers I've printed on have an unprintable area of: top=10mm, bottom=10mm, left=10mm, right=6mm.

DISCUSSION -----

The LaserWriter IIf and LaserWriter IIg have a non-printable margin of 5mm around the page. The problem you have is due to a lack of memory in the LaserWriter IIf. The largest page size a 2MB LaserWriter IIf can print is a4small, which is 7.68 by 11 inches. The default page size that is used is lettersmall, which is 7.89 by 10.30 inches. A 2MB LaserWriter IIf can't print a letter size (8.11 by 10.79 inches), or legal size (8.11 by 13.79 inches) page. The only way around this is to upgrade the memory of the LaserWriter IIf to 4MB.

A 4MB LaserWriter IIf can print any of the following page sizes:

legal:	8.11 by 13.79 inches
a4:	7.89 by 11.44 inches
letter:	8.11 by 10.79 inches
a4small:	7.68 by 11 inches
lettersmall:	7.89 by 10.30 inches
b5:	6.72 by 9.81 inches

3M DC2000 Tape Cartridges: Storage and Longevity

Revised: 2/4/92
Security: Everyone

3M DC2000 Tape Cartridges: Storage and Longevity

==========

Article Created: 4 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What is the storage life of DC2000 tape cartridges? How long we can safely store a cartridge without losing the data?

DISCUSSION ----------

Our answer is from the 3M Recording Products Division Hotline. They don't state the probable maximum life-span of data stored on a DC2000 tape cartridge. They advise that the tape be retensioned every year, and to rewrite the data out onto the tape every 5 years.

Note: To rewrite the data onto a tape cartridge, you'll probably need to restore the data to a hard disk, then back up that hard disk again. All previous mention of how to properly store the tape applies.

Backups

The tape cartridge life-span can be greatly influenced by the environment you store and use it in, as well as whether you back up the tapes by volume or by file.

- Volume
  If you back up tapes by volume, your cartridge may last for a couple thousand backups. This estimate isn't based on any controlled study. It's based on the assumption that during a volume backup, after the initial tensioning of the tape, the drive will generally record information on the tape from the beginning to wherever it stops once it completes transferring all of the information. This is usually in one or two continuous passes. Incidentally, the noise (pitch and volume changes) the drive makes when performing a volume backup isn't from the

drive stopping the tape, rewinding it, then proceeding forward.
The drive generates this noise when it switches tracks.

- File
  Backing up onto the tapes by file is much more stressful on the tape.
  When the files are fragmented on the drive, the drive may have to reverse
  direction of the tape many times to lay the files down sequentially on
  the tape. We are unable to predict the longevity of a tape used for
  file backups. These three factors influence longevity:

  - The great variation in the quantity of files backed up

  - The differences in file size

  - Degree that files are fragmented

  However, prudence should dictate practice when archiving data.

Operating Environment

The operating environment also influences the tape life. Before using the cartridge, allow it to acclimate to your operating environment for eight hours, or for the amount of time it has been exposed to dissimilar conditions -- whichever is less. Recommended operating environment:

Temperature:	41 to 113 degrees F (5 to 45 degrees C)
Relative Humidity	20 to 80% non-condensing
Maximum Wet Bulb Temperature	79 degrees F (26 degrees C)

Store tapes out of the direct sunlight and where they won't be exposed to high temperatures.

SNA•ps 3270: Macintosh Quadra Installation and Compatibility

Revised: 2/4/92
Security: Everyone

SNA•ps 3270: Macintosh Quadra Installation and Compatibility

==========

Article Created: 5 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I'm unable to get the SNA•ps software to run on a Macintosh Quadra 900. I turned off all the INITs except the SNA INITs and still can't get the program to run without crashing. I have turned 32 mode off/cache off and every combination in between. Is there a known problem? If so, is there a fix in the works?

DISCUSSION -----

SNA•ps 3270 v1.0.1 (the client software) is compatible with the Macintosh Quadra computers. However, you may have done an Easy Install or a Custom Install, and selected SNA•ps CUT and SNA•ps NLCA. In this case, you must remove the extensions, SNA•ps CUT, and SNA•ps NLCA from the Extensions folder. These extensions aren't compatible, and SNA•ps 3270 will hang when you launch it.

The preferred way to install SNA•ps 3270 on a Macintosh Quadra is to do a Custom Install and Choose "SNA•ps 3270 Client, System 7."

The original Macintosh Quadra compatibility booklet distributed with the Macintosh Quadra computers and the compatibility report posted on AppleLink say that both SNA•ps Gateway and SNA•ps 3270, versions 1.0 and later, are compatible with Macintosh Quadra computers. Only SNA•ps 3270 is compatible if you follow the above guidelines.

Note that only a few copies of SNA•ps 3270 version 1.0 were distributed before SNA•ps 3270 was revised to version 1.0.1. There are no functional differences, only a cosmetic one with one dialog.

System 7.0.1: Change Overview

==========

Article Created: 10 December 1991

Article Change History

09/25/92 - REVIEWED
- For technical accuracy.

TOPIC ----------

This article describes the differences between System 7.0 and 7.0.1. They fall under two main headings:

- cdevs/Extensions

- System File

DISCUSSION ----------

CDEVs/Extensions

Memory

RAM Disk Support on Quadra and PowerBook Computers Support for RAM Disk on the Macintosh Portable was moved from the Portable control panel to the Memory control panel. Minor internal changes were made to all of the "panels" inside memory. Specifically, the virtual memory and RAM Cache "panels" were updated to work correctly with the new RAM disk and to work with the existing RAM disk on Macintosh Portable computers. The previous version of the Memory control panel would let users reduce the size of the virtual memory backing store (by reducing virtual memory). This change would take effect before restarting. This was corrected under 7.0.1 to occur at restart.

Portable

The screen brightness and contrast sliders previously found in Portable were removed. The PowerBook family has hardware controls on the front to control contrast and brightness. For the Classic family, Macintosh Portable, and PowerBook 100, a dedicated control panel called "Brightness" provides control of the overall screen brightness. RAM disk controls for the Macintosh Portable previously found in Portable have moved to Memory.

Portable supports internal modems in PowerBook 140 and 170 as well as in the Macintosh Portable.

Brightness

The brightness control panel supports Macintosh Portable, Classic, Classic II, and PowerBook 100 computers. The control panel is a simple slider that controls overall screen brightness.

Network

Minimal Network changes support on-board Sonic Ethernet for the Quadra family.

Battery

Battery was updated to work with the PowerBook family. Battery now provides users with a button to put the computer to sleep immediately.

Caps Lock

The Caps lock indicator panel places a visual indicator of the state of the Caps Lock key on the right end of the menu bar. Available only on PowerBooks.

File Sharing Extension

An internal 4K file sharing buffer was increased to 5K. With the increased performance of the Quadra family's built-in Ethernet, a slightly larger buffer increased the file sharing throughput by 2 times on those computers.

Cache Switch

There's a new control panel for the Quadra computers to disable or enable the 68040 cache. The control panel simply sets a PRAM byte and the System does all the work at the next startup.

A/ROSE and DAL

General 68040 compatibility changes.

HD SC Setup

Minor changes to support new hardware and to change a format-time mode select.

System File

OS

- Keyboard patch wakes up sleeping Putter (Macintosh Classic) keyboards.

- Supports the 53C96 SCSI chip found in the Quadras and PowerBooks 140 and 170. At startup, a linked patch was added to wait for all SCSI drives connected at the previous startup to spin up before continuing the launch. This is for Macintosh Quadras and PowerBooks 140 and 170 only.

- Minor LocalTalk changes for 68040 compatibility.

- Minor changes to Gestalt 'lram', 'ram ', and 'kbd ' selectors for RAM disk/PowerBook keyboard support.

- Updated _hwPriv CPU cache management and dispatch routines.

- Updated keyboard maps for Key Caps (PowerBook keyboard).

- Supports the new Macintosh PowerBook 140/170 power manager.

- Startup code inhibits 68040 cache depending on setting of Cache Switch CDEV.

- Bitmapped system fonts were marked unpurgeable in System 7.0. These are now marked purgeable under 7.0.1.

ToolBox

- SANE (Standard Apple Numerics Environment) performance was improved via backpatching. The new SANE is functional on all computers with a IIci class universal ROM and a Floating Point Unit. It's occasionally noticeable in applications that use SANE on computers with a FPU.

- The Disk Initialization Package now creates an MFS disk when the size of the volume is exactly 800 blocks (400K), instead of doing so on sizes less than or equal to 800 blocks. This is to prevent RAM disks that are smaller than 800 blocks from being formatted as MFS volumes. It is

impossible to create a RAM disk with exactly 800 blocks.

- The Notification Manager has been changed to call IdleUpdate when NMInstall is called (on portables) to wake the system up when a notification is about to be posted.

- Enables powerdown messages on Quadra 900 and RAM disk. The warning code, "has files on it and will be erased if you shut down" was added to the Shutdown Manager. Also, all open video drivers are closed before the power is killed at _Shutdown.

- Support for Quadra and PowerBook sound hardware and internal sound input source selection was added to the Sound Manager.

- The backlight driver was upgraded to work with the PowerBook family.

- SetHandleSize was fixed for all 32-bit memory managers.

General

- Various strings and dialogs, required in the support of the new systems, were added.

- Several minor changes that reduce the overall size of the run time system heap were made to compensate for the memory required by the new CPU support.

- The Installer script file has been substantially revised to address the needs of the new systems.

Macintosh Quadra: How On-board Ethernet Differs from Ethernet NB

==========

Article Created: 19 December 1991
Article Last Reviewed: 5 August 1992
Article Last Updated:

TOPIC ----------

Does the built-in EtherTalk capability on the Quadra systems have the same functionality as the Ethernet NB Card?

DISCUSSION ----------

The Quadra's on-board Ethernet has the same functionality as the Ethernet or EtherTalk NB card. But it's about 15-20% faster because it uses DMA, doesn't rely on NuBus data transfers, and the chip is operating at the faster system bus clock rate.

The Quadra's on-board Ethernet is implemented using the National DP83932 SONIC Ethernet controller chip. This device includes an IEEE 802.3 encoder/decoder (ENDEC), media access control (MAC) unit, separate 32-byte send and receive FIFOs, and DMA controller in one device. SONIC is housed in a 132-pin PQFP package. A small ROM provides the Ethernet global address (which provides a unique 48-bit identity for each Quadra built). The SONIC controller includes DMA capability. It will request the bus and transfer data between its internal registers and main memory.

The Apple AUI (AAUI) connector provides outside connection. The AAUI connector is compatible with any of the FriendlyNet drop boxes that provide transceivers for thick net, thin net, or 10BaseT networks.

I'm having a problem sending a MacX application to a Macintosh with the new HP 730 (75 Mip server).

Configuration:

- Macintosh IIci
- 8MB memory
- 80MB disk
- Ethernet over twisted pair
- System 7 with MacX 1.1.7
- MacTCP 1.1
- MacTCP Tool 1.1.7

I've tested the above system with a DEC VMS system and it works fine. I can even Telnet into the HP server from the Macintosh. I can send the MacX application to an HP X terminal. But I can't send it to MacX. I've used the standard commands such as "setenv DISPLAY 1.1.1.1:0" and "xterm 1.1.1.1:0" and almost anything else I can think of.

DISCUSSION ----------

After a Macintosh successfully sends to the HP server, try the following command (assuming that X.X.X.X is the Macintosh IP address).

Begin_Table

	root#	/usr/bin/X11/xterm -display X.X.X.X:0.0
or	root#	setenv DISPLAY X.X.X.X:0.0; xterm (root is running csh)
or	root#	env DISPLAY=X.X.X.X:0.0 /usr/bin/X11/xterm (root is running sh)

End_Table

In MacX, try running any of the above commands from the Remote menu. If it works from the HP server to the MacX, but fails from the MacX to the HP server, then you must have a networking permission related problem from MacX to the HP server. We've seen this scenario in a SunOS host which implemented a feature in the "rexecd" code that doesn't allow a host that isn't listed in the /etc/hosts file or YP (now called NIS) name server to execute the "rexecd" command. The solution for it is to add the Macintosh IP address and host name to the Sun's /etc/hosts file or the NIS name server. We suggest that you check this with the HP server to see if it has the same problem.

A/UX: Increasing Maximum Open Files per Process

==========

Article Created: 2 December 1991

Article Change History

08/31/92 - REVIEWED
o For technical accuracy.

TOPIC ----------

Is there a way to increase the maximum number of files that one A/UX process can open simultaneously?

Normally the maximum is 32 (and this includes stdin, stdout, and stderr). In stdio.h we found the identifier FOPEN_MAX, but modifying this isn't sufficient. We also found the identifiers OPEN_MAX in limits.h and NOFILE in sys/params.h. However, modifying these identifiers to a higher value (for example 40) in our own source doesn't work either.

Is it possible that these values are fixed in certain system libraries or in the object code of the system calls (open, creat)? Is there an easy way to change this, both in A/UX 2.0.1 and 3.0?

DISCUSSION ----------

There is no way to adjust the number of open files available to each process without recompiling the kernel, because it was hard-coded in the kernel. If you try to use "adb" to change this value, other kernel structures will be affected and mixed. You won't be able to recompile the kernel without kernel sources.

The upcoming A/UX 3.0 release increases the maximum number of open files per process to 128. These defined constants, OPEN_MAX (in /usr/include/limits.h) and NOFILE (in /usr/include/sys/param.h), are in A/UX 3.0

CodexEvents Library: Apple Events For UNIX

==========

Article Created: 2 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC --

On November 18, 1991, Codex Software Development Pty. Ltd. of Melbourne, Australia announced the development of CodexEvents. This is an Apple event style library for providing interapplication communications facilities between Macintosh, UNIX, and Microsoft Windows systems.

DISCUSSION --

Developers can use the CodexEvents library to send messages between independent programs running on different computers. The library is compatible with the Apple events API defined by Apple Computer, Inc. for use with the Apple events messaging protocol. For each Apple event call there is a corresponding CodexEvent call. Thus, it requires very little effort to convert code that uses Apple events to use CodexEvents instead.

"For the first time, we have a truly platform independent messaging protocol which is high level enough to be useful." said J. Matthew Pryor, Director of Software Technology at Codex. "CodexEvents makes writing cross-platform software feasible, by providing a standardized, high level messaging protocol for programmers on Macintosh, UNIX or Windows platforms."

Codex has also developed a background application for the Macintosh which allows a non-Macintosh application to send Apple events to applications running on the Macintosh. This application acts as a protocol converter for incoming CodexEvents, translating them into Apple events which Apple event-aware applications, such as the Macintosh Finder or Microsoft Word, can respond to directly.

CodexEvents is currently available for SunOS, NeXT and Macintosh. The

Macintosh library operates under both System 7.0 and also under System 6.0.5 or later. So developers can use CodexEvents to add interapplication messaging facilities to their non-system 7.0 applications.

CodexEvents currently requires MacTCP to be installed on each Macintosh and TCP/IP protocols to be available on the non-Macintosh computers. CodexEvents is engineered to be network independent however, and versions which use Novell, 3Com and AppleTalk are under development.

Parties interested in licensing CodexEvents should contact Brett Adam of Codex.

Codex Software Development was founded in 1989 with the express purpose of developing cross-platform software technology and innovative software products for the general marketplace.

This information is provided by the product's developer or distributor and constitutes neither an endorsement nor a recommendation by Apple Computer, Inc.. Apple assumes no responsibility with regard to selection, performance or use of this product. All understandings, agreements and warranties, if any, take place directly between the developer and the prospective user.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

A/UX: Changing Slice Number with dp (8/94)

Revised: 8/30/94
Security: Everyone

A/UX: Changing Slice Number with dp (8/94)

==========

Article Created: 18 December 1991
Article Reviewed/Updated: 30 August 1994

TOPIC ----------

I have a problem with my A/UX hard drive (Micronet 400MB with all the database software). The drive was partitioned into 11 partitions, for example:

Swap : slice 1
Ingres : Slice 2
Oracle : Slice 3
Informix : Slice 4

Now I have several different partitions with the same slice number: slice 3. The partitions map seems to be OK (blocks, type of partition, and so on), except the slice number. Do you know if it's possible to change the slice number of a partition by using the dp command, and without losing the information?

DISCUSSION ----------

First, make sure all partitions' physical starting locations don't overlap.

Suppose your Micronet disk drive's SCSI ID is 5, and has two disk partition entries (5 and 6) with the same slice number 3, and you want to change entry 6 with the new slice number 8. Log in as root and do the following:

```
            # dp /dev/rdsk/c5d0s31
    --->Command? p6             <==== Your input # view partition entry 6
    --->Command? c6             <==== Your Input # change partition entry 6
    --->DPME Field? b           <==== Your Input # change BZB
    --->BZB Field? s            <==== Your Input # change slice number
    --->Slice number + 1 [3]: 9 <==== Your Input # assign slice number 8
    Note: [3] indicates the current slice number
    --->BZB Field? q            <==== Your Input # quick BZB mode
```

```
    --->DPME Field? q           <==== Your Input # quick DPME mode
    --->COmmand? w              <==== Your Input # write changes
    --->Command? q              <==== Your Input # quick dp
             #
```

Note that the s slice number (bzb_slice) command in the BZB-field mode isn't documented in either dp(1M) hard copy document or the dp(1M) on-line manual pages.

Macintosh: Files Required to Play Audio CDs (5/95)

==========

Article Created: 17 January 1992
Article Reviewed/Updated: 30 May 1995

TOPIC ----------

Every time I insert an audio CD into the AppleCD attached to my Macintosh computer, a dialog appears asking if I want to initialize the CD. Why?

DISCUSSION ----------

You are missing one or more of the system extensions needed to play audio CDs.

With System 7.1 and later, these files must in the Extensions folder:

Apple CD-ROM
Audio CD Access
Foreign File Access

The AppleCD Audio Player is an application, so it can go anywhere on your hard disk. However, if it is in the Apple Menu Items folder, you can easily access the AppleCD Audio Player from within any application.

If you have an AppleCD 600, you need to use v5.0.4 or later of the Apple CD-ROM extension.

System 7.x: Limitations on Use of 400k Disks (8/96)

Revised: 8/27/96
Security: Everyone

System 7.x: Limitations on Use of 400k Disks (8/96)

==========

Article Created: 12 December 1991
Article Reviewed/Updated: 27 August 1996

TOPIC ----------

1) What is meant by MFS disks?

2) What are HFS disks?

3) With the introduction of HFS disks was it still possible to format disks as MFS?

4) How did the introduction of System 7 affect the ability to read and write to MFS disks?

DISCUSSION ----------

1) Question: What is meant by MFS disks?

Answer: The first Macintosh computers used only 400k single-sided disks, formatted as MFS (Macintosh File System) volumes which used a flat file structure, and no subdirectories (folders in Macintosh vocabulary). Although you could create and place documents and folders into folders, they existed only in the Finder's view of the disk.

2) Question: What are HFS disks?

Answer: With the introduction of HFS (hierarchical file system) and 800k, double-sided disks, the concept of subdirectories (folders) came to the Macintosh.

3) Question: With the introduction of HFS disks was it still possible to format disks as MFS?

Answer: Yes. The default format for a single-sided disk was MFS. Although by holding down the Option key when selecting the Erase option you could create a 400k HFS volume. In systems prior to System 7, when viewing the window of a volume in Icon view, an HFS volume would have one black pixel at the far left-hand side of the double horizontal lines that appear below the title bar.

4) Question: How did the introduction of System 7 affect the ability to read and write to MFS disks?

With the introduction of System 7, the ability to read and write files to MFS volumes was retained to maintain compatibility. However, there are some limitations:

* You can still create an MFS volume on a single-sided disk by holding down the Option key (and keeping it held down until the formatting is complete) when selecting Erase Disk under some versions of System 7, including System 7.0x and System 7.1. However, you cannot create an MFS disk under System 7.5.

* With the PC Exchange control panel or ProDOS extension installed, you cannot format disks as single-sided disks. Although you can still write to and read from single-sided disks, both MFS and HFS. So, you must disable this control panel and/or extension if you want to format 400k disks.

* Folders that you see on MFS disks under pre-System 7 systems are no longer visible because the Finder in System 7.x ignores folders created by older versions of the Finder on an MFS disk. A file in such a folder appears in the root level of the disk, but has the same relative position in the window that it has in the MFS folder.

* All the files appear at the root level.

* You cannot rename existing MFS volumes.

* You cannot create new folders on these volumes.

* The Finder does not use or save window position or size information about files located on an MFS disk.

* If you select the single-sided option when formatting a disk, it will be formatted as an MFS volume.

* MFS disks cannot have comments. However, files located within MFS disks can have comments.

* You cannot create an alias for an MFS volume. More generally, Alias Manager functions and the FSMakeFSSpec function do not work if their target is an MFS volume. You can, however, create aliases for files on an MFS volume. Similarly, you can use the new File Manager functions that use FSSpec records on files on an MFS volume.

* You should not call the File Manager function PBGetFCBInfo on MFS volumes.

* The Process Manager's GetProcessInformation function may not return correct results about the location of the application file if the application file resides on an MFS volume.
*If you rename an edition located on an MFS volume, the Edition Manager may not be able to find that edition for any document that publishes to or subscribes to it. Also, if you open an edition in the Finder that is located on an MFS volume and updates the edition, the Finder window closes.

Note: Many of these limitations listed here are documented in Inside Macintosh VI, chapter 25, page 25-9:

System 7: Opening Documents by Dragging them Over an Application

==========

Article Created: 12 December 1991

Article Change History

08/25/92 - CORRECTED
- To show the correct documentation reference.

TOPIC ----------

What rules does System 7 use to decide whether I can drop a document on an application icon to have the application open it?

The System frequently doesn't highlight the icon I'm trying to drop the document onto. This is a potentially useful feature. I don't think I've ever done it with an alias of an application.

DISCUSSION ----------

The application determines what documents to open when they are dropped on the application icon. There is an FREF resource which now has two main functions for an application:

- Associates the icons defined with file types used by that application.

- Allows you to drag document icons to an application icon to open the documents from that application.

An application should create an FREF resource for the application file itself, and create separate FREF resources for each file type that the application can open. Each FREF resource specifies a file type. The file type can be defined for:

- Files created by that application only

- Files created by other applications that the application supports

- Files of the existing general types, such as TEXT or PICT

When you drag a document icon to an application icon, the Finder checks a list of that application's FREF resources. If the document's file type appears in the FREF resource list, the Finder launches that application with a request to open that document. It's up to the application to open the files according to the needs of the user.

An alias should act the same way as the original it was created from, as the file type will be the same. If you're having problems launching a document alias created by the application you're dragging the alias to, rebuild the Desktop.

There is further information in Chapter 9 (Finder Interface) of Inside Macintosh VI.

PowerBook: Above 10,000 Feet, Keep In Pressurized Cabin (5/96)

Revised: 5/21/96
Security: Everyone

PowerBook: Above 10,000 Feet, Keep In Pressurized Cabin (5/96)

==========

Article Created: 9 January 1991
Article Reviewed/Updated: 20 May 1996

TOPIC ----------

The Getting Started manual for my PowerBook states that the computer should not be operated above 10,000 feet. Does this mean that my PowerBook cannot be used on airplanes that cruise above 10,000 feet?

DISCUSSION ----------

Macintosh PowerBook computers can be used in airplanes, provided the cabin is pressurized under 10,000 feet. Some models can be transported in airplanes with pressurization no higher than 15,000 feet.

Commercial airliners generally maintain cabin pressure to an 8.5 psi differential. As an example:

Cruise Altitude	Cabin Altitude
22000 feet	Sea Level
25000 feet	1420 feet
30000 feet	3640 feet
35000 feet	5600 feet
40000 feet	7290 feet
45000 feet	8670 feet

Only the Concorde cruises above 45,000 feet. That aircraft utilizes a special fuselage design which can sustain much higher differential pressures than 8.5 psi, which allows it to keep the cabin pressure well under 10,000 feet as well.

From this, it is apparent that cabin cruise altitudes will not exceed the 10,000 foot limitations of most PowerBook computers. There are, however, the following points to be made.

So what's the risk?

On PowerBook computers, when altitude limits are exceeded, the principal risks we have observed include general operational problems, hard drive problems, and even the possibility of screen cracking.

Destination higher than 10,000 feet

We are not aware of any airports in the United States with elevations higher than 10,000 feet. Such destinations do exist in other countries. Since the airplane must land, its cabin pressure will eventually be raised to the landing altitude. However, we also discourage the use of the PowerBook at such elevations.

Is the cargo hold pressurized?

The cargo compartment of most commercial airliners is, in fact, part of the airplane's pressure hold, and is pressurized. Check with your specific carrier if in doubt.

Cargo hold risks

The cargo hold brings a combination of other threats. The combination of lowered air pressure during cruise (see above), lowered temperature (the cargo area is typically much cooler than the passenger cabin), and vibration can all combine to create a very hostile environment. In addition, suitcases, which tend to be moist environments, can be cooled such that condensation will appear on solid surfaces. This could further aggravate the situation.

In addition, the risk of damage by rough handling or damage from other suitcases is increased when out of sight of the owner.

Private planes

Most light private planes are not pressurized, but many can climb above 10,000 feet. Even if a light plane has a pressurized cabin, its cargo area may not be. Some light aircraft with high altitude capabilities and unpressurized cabins utilize oxygen systems to keep the occupants shipshape.

Some business jets similarly have unpressurized cargo compartments.

Military aircraft

Military aircraft come in all forms. Fighter cockpits, for example, tend to pressurize to a 5 psi differential, so their cabin altitudes will tend to be much higher than on a passenger jet. Check with the operator to determine what the likely environmental extremes can be.

Are there any other risks?

If the cabin undergoes decompression, the PowerBook could be exposed to extreme environmental factors.

Some all-cargo operators may opt to shut down a portion of their pressurization system, thus increasing fuel efficiency. This would have the effect of raising cabin altitude, possibly to limits which could comprise a threat to a PowerBook.

Some air taxi operators do not use pressurized aircraft, but may normally cruise in the 8 to 9 thousand foot range. In some circumstances, such as weather avoidance, they may climb above 10,000 feet.

So what does Apple recommend?

Apple recommends transporting the PowerBook in the passenger cabin, and not utilizing it above 10,000 feet. Damage caused by hostile operating or storage environments is not covered by the Apple limited warranty.

Users concerned about these issues are encouraged to investigate comprehensive insurance to protect against the financial consequences of inadvertent damage.

PowerBook: How To Print From External Modem Port (7/95)

==========

Article Created: 9 January 1992
Article Reviewed/Updated: 10 July 1995

TOPIC ----------

I have been trying to print directly from my PowerBook 160's modem port to a StyleWriter and an ImageWriter II. Sometimes I get the message that the job is printing, but the job does not print. Other times, I get error messages. I do not have this problem with the printer port.

DISCUSSION ----------

This information only pertains to PowerBooks that have two serial ports rather than a single serial port. PowerBooks that have two serial ports include most of the PowerBook 100 series computers (140, 145, 145b, 170, 160, 165, 165c, 180 and 180c).

For information detailing serial printing from PowerBooks that have a single serial port search for the article titled "PowerBook: Printing to Serial Printer-Single Serial Port."

TO USE THE EXTERNAL MODEM PORT TO PRINT TO A SERIAL PRINTER:
==========

PowerBook With No Internal Modem
==========

• Select the desired printer driver in the Chooser (such as the StyleWriter II) on the left side of the window.

• On the right side of the Chooser window where it says, "Select a port," select the modem port instead of the printer port.

Even though you will have one of the control panels described below in your Control Panels folder you will not see the choices described (internal/external, compatible/normal, use Express Modem/use External Modem) in your control panel because your PowerBook has no internal modem and external modem to choose

between.

PowerBook With Internal Modem
==========

• Change the default setting in the one of the following control panels: Portable, PowerBook, PowerBook Setup, or Express Modem. The specific control panels and settings that need to be changed are listed below under each specific software version.

• Select the desired printer driver in the Chooser (such as the StyleWriter II) on the left side of the window.

• On the right side of the Chooser window where it says, "Select a port," select the modem port instead of the printer port.

System 7.0.1

• Change the default setting in the Portable control panel from Internal Modem to External Modem.

• Use the StyleWriter driver version 7.2.2 to correct a problem with the Portable control panel that occurred when selecting the Internal/External Modem setting.

System 7.1

• Change the default setting in the PowerBook control panel from Internal Modem to External Modem.

System 7.1 w/System Update 3.0, 7.1.1 or 7.5

• Change the default setting in the PowerBook Setup control panel from Compatible to Normal.

• Normal versus Compatible
In the Normal mode, the modem is addressed via the System 7 Communication Toolbox, and the external port is available for usage.

If your communication program is NOT compatible with the Communication Toolbox, set the PowerBook Setup control panel to Compatible. This mode prevents the external serial port from being addressed by other programs, as well as preventing communication with a serial printer.

Express Modem Software v1.5 or Later Installed

• Change the default setting in the Express Modem control panel from Express Modem to External Modem.

Apple Telecom 2.0

In the Express Modem control panel, remove the "x" in the box for the selection "use internal modem instead of external Modem Port".

Macintosh: System 7 and More than 8MB of RAM

==========

Article Created: 14 January 1992
Article Last Reviewed: 19 May 1992
Article Last Updated: 19 May 1992

TOPIC ----------

My Macintosh Quadra 700 with 20MB of RAM, has only 7MB available. The system software takes up 13MB of RAM.

DISCUSSION ----------

If you have more than 8MB of RAM installed in a Macintosh, you can access only 8MB of that RAM unless you have 32-bit addressing turned on in System 7 or you're using A/UX. With 32-bit addressing turned on, you can access up to 128MB of physical RAM. under System 7.

To turn 32-bit addressing on, turn 32-Bit Addressing on in the Memory control panel and restart.

If you're running System 7 in 24-bit addressing mode, or any version of system software before 7.0, any RAM beyond 8MB is treated as if it is already being used by the System heap, and is unavailable for your use.

In your case, a Macintosh Quadra 700 has 20MB of RAM, 12MB of which is automatically allocated to the System heap and is unused. If the System is reported as using 13MB, then the System is actually occupying 1MB of the available 8MB of RAM.

08/25/92 - REVISED
- To make clear that holding down the option key still has a role in the System 7 Monitors control panel.

TOPIC ----------

I recently upgraded my Macintosh IIci to system software version 7.0. Under version 6.0.X, when I wanted to change the memory allocation for the built-in video, I used this procedure:

1) In the Control Panel, I selected the Monitors cdev.

2) I pressed the Option key and clicked the "Options..." button.

A dialog box appeared, and in the bottom portion of the dialog box, labeled "Memory Allocation For Built-In Video", there were radio buttons for setting how much memory to allocate to video.

Is this still the correct method for System 7?

DISCUSSION ----------

Under system software version 7.0, you no longer need to press the Option key. Just click the "Option..." button in the Monitors control panel to display the dialog box.

If you do hold down the Option key when clicking the "Option..." button in the Monitors control panel, you are presented with an option to "Use Special Gamma" for applications where accurate color representations are

essential, or in situations where two differernt types of monitors are used whose colors must match.

Personal LaserWriter LS: Performance Varies with Computer Speed

==========

Article Created: 13 December 1991

Article Change History

04/13/93 - UPDATED
- To give clearer examples

TOPIC ----------

Printing time is slower when I print from a Macintosh Plus to a Personal LaserWriter LS than it is when I print from a Macintosh Classic II or Macintosh IIci to the same Personal LaserWriter LS.

DISCUSSION ----------

Because the speed of the Macintosh computer's CPU affects the printing time, printing from a Macintosh Plus to the Personal LaserWriter LS is slower than from a higher-speed computer, like the Macintosh Classic II or Macintosh IIci.

The Personal LaserWriter LS has a high-speed RS-422 serial interface, externally clocked at 909KB/sec. At optimum performance, it prints four pages per minute.

System 7: If Mouse Control Is Lost During Upgrade From System 6

==========

Article Created: 13 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I tried to upgrade my Macintosh IIcx to system software version 7.0. During the upgrade, I lost mouse control. I swapped the keyboard and mouse from my Macintosh IIfx, which I successfully upgraded to version 7.0, and tried them with the Macintosh IIcx. I still lost mouse control during the upgrade.

DISCUSSION ----------

You may be experiencing an INIT conflict. First, make a backup copy of your System Folder. Then remove the System Folder from your hard drive and try the installation again.

Also, if you are using any third-party ADB devices, contact the manufacturer and ask if there are any known or reported compatibility problems with their product and version 7.0.

Macintosh II and IIx: 16MB SIMMS, MODE32, and RAM (9/95)

Revised: 9/15/95
Security: Everyone

Macintosh II and IIx: 16MB SIMMS, MODE32, and RAM (9/95)

==========

Article Created: 9 December 1991
Article Reviewed/Updated: 15 September 1995

TOPIC ----------

According to the "Macintosh Memory Guide" from Connectix, Page 17, second paragraph:

"3) On standard Macintosh II computers Bank A cannot use SIMMs larger than 2MB. 4, 8, and 16MB SIMMs must only be put in Bank B. Also, Bank A must be filled with SIMMs of 2MB or less if Bank B is to be used. Bank A is the set of four sockets to the right as you face the front of the Macintosh. This is a problem unique to the Macintosh II, and is caused by problems in the Macintosh II ROMs which are not overcome by adding MODE32 or MAXIMA. However, you can fix this one problem by installing the FDHD Apple SuperDrive Upgrade kit, which includes a set of Macintosh IIx ROMs. As a result of this limitation, the largest memory configuration on unmodified Macintosh II computers using 1MB and 4MB SIMMs is 20MB: four 1MB SIMMs in Bank A and four 4MB SIMMs in Bank B. When Macintosh IIx ROMs are added the maximum memory the computer will support is 128MB, eight 16MB SIMMs."

Is this information accurate? I was under the impression that the Macintosh II and Macintosh IIx could physically support only 4MB SIMMs.

DISCUSSION ----------

Below is an excerpt from another article describing MODE32. The excerpt describes Macintosh II RAM issues. To see the full article, search under MODE32.

"The Macintosh II and Macintosh IIx require special 4MB SIMMs. Be sure to specify your Macintosh model when ordering these SIMMs and ensure that the vendor is aware of the difference. The Macintosh II requires the Macintosh II FDHD Upgrade to use 4MB SIMMs.

This upgrade has been discontinued.

To take advantage of more than 8MB of physical RAM, the Macintosh II MUST have a PMMU installed, so that MODE32 can expand the system's memory map.

The Macintosh II will not start up if you install 4MB SIMMs in bank A. You'll hear musical chimes at startup, indicating a hardware failure. Install 4MB SIMMs in bank B, and use 256K or 1MB SIMMs in bank A."

If you read the part about the Macintosh II carefully, you will see that it cannot have greater than 1MB SIMMs in Bank A, or you will get musical chimes. Since this happens so early in the boot process, there is nothing that can be done in software to remedy this. This means that a Macintosh II can have a maximum of 68MB of RAM installed (using a PMMU and MODE32). To achieve this amount, you would have 4MB in Bank A, and 64MB in Bank B (using 16MB SIMMs).

A final, but very important issue here concerns the part discussing the special SIMMs required by the Macintosh II and Macintosh IIx. There is nothing to say that vendors will actually make 16MB SIMMs using this configuration.

Article Change History:
15 Sep 1995 - Revised to show discontinued upgrade.
02 Apr 1995 - Updated for clarity.
02 Mar 1994 - Emphasized the need for a PMMU to utilize more memory.

PowerBook: How to Eliminate Clicking Noise (5/95)

Revised: 5/15/95
Security: Everyone

PowerBook: How to Eliminate Clicking Noise (5/95)

==========

Article Created: 10 January 1992
Article Reviewed/Updated: 15 May 1995

TOPIC ----------

I hear random clicks from my PowerBook 170. Adjusting the volume to zero doesn't eliminate the problem.

DISCUSSION ----------

The click is the power manager shutting down the amplifier to extend battery life. It happens approximately thirty minutes after the last sound is played. It's not a bug, but it can be annoying.

For the PowerBook 100, 140, 145, and 170, you can disable the speaker by inserting a mini plug in the sound out port. When you want sound, unplug it. This way you can eliminate sound and turn on the system in a meeting without disturbing others.

For newer PowerBook computers (the 160 and newer, as well as the Duo series), if you want to shut off sound entirely, set the volume in the Sound control panel to zero and the PowerBook will not make any sound, at startup or any other time.

PowerBook: SCSI Termination Differs from Other Macintosh Models

Revised: 5/17/94
Security: Everyone

PowerBook: SCSI Termination Differs from Other Macintosh Models

==========

Article Created: 10 January 1992
Article Reviewed/Updated: 2 July 1993

TOPIC ----------

The Macintosh User's Guide for PowerBooks says that you need two terminators when connecting to one SCSI peripheral.

Is this correct? This is not true for any other Macintosh.

DISCUSSION ----------

The manual is correct. Due to differences in the internal termination scheme, the PowerBooks require two terminators for one to six external SCSI devices. Other Macintosh computers require one terminator for one device, and two terminators for more devices.

Article Change History

07/02/93 -Updated to include all PowerBook models.

LaserWriter: PageMaker 4.2 Uses PPD, Not APD Files (8/95)

Revised: 8/22/95
Security: Everyone

LaserWriter: PageMaker 4.2 Uses PPD, Not APD Files (8/95)

==========

Article Created: 13 January 1992
Article Reviewed/Updated: 22 August 1995

TOPIC ----------

There's a problem printing Aldus PageMaker 4.0 documents to a LaserWriter. Any suggestions?

DISCUSSION ----------

To print publications, Aldus PageMaker 4.2 uses PostScript Printer Description files (PPD files) in much the same way as earlier versions of PageMaker used Aldus Printer Description (APD files). PageMaker 4.2 doesn't use APD files. Therefore, when you open a PageMaker 4.0 or 4.0.1 publication in PageMaker 4.2, you must choose Print… to specify a new printer (by selecting a PPD). When you first choose Print… you will receive an error message indicating that PageMaker failed to find a PPD. The message is misleading:

- First, the PPD it refers to corresponds to the APD you last specified in the 4.0 or 4.0.1 publication
  and
- Second, it implies that it searched and didn't find the PPD in the PPDs folder when this is not actually the case.

Simply click Continue, to open the Print dialog box. Choose the PPD you want from the Printer type pop-up menu.

It's a good idea to save the publication after selecting the PPD, otherwise you'll get the message each time you print.

NOTE: When you open a PageMaker 4.2 publication in PageMaker 4.0 or 4.0.1, you must open the Print dialog box and select an APD.

The following is a list of PPD files shipped with PageMaker 4.2 for Apple printers:

Apple LaserWriter IIf v2010.113
Apple LaserWriter IIg v2010.113
Apple LaserWriter v23.0
Apple LaserWriter Plus v38.0
Apple LaserWriter Plus v42.2
Apple LaserWriter IINTX v47.0
Apple LaserWriter IINTX v51.8
Apple LaserWriter IINT v47.0
LaserWriter Personal NT v51.8

The following is a list of PostScript versions from the Tech Info Library article, "Postscript: Versions in LaserWriter ROMs."

Printer	Revision # Displayed on Test Print	ROM Size	PostScript Version
LaserWriter	1.0	256K	23.0
LaserWriter	2.0	512K	38.0
LaserWriter Plus	2.0	512K	38.0
LaserWriter Plus	3.0	512K	47.0
LaserWriter IINT	1.0	1MB	47.0
LaserWriter IINTX	1.0	1MB	47.0
LaserWriter IINTX	3.0	1MB	51.8
Personal LaserWriter NT	1.0	1MB	51.8
LaserWriter IIf	1.0	2MB	2010.113
LaserWriter IIg	1.0	2MB	2010.113
Personal LaserWriter NTR	1.0	2MB	2010.129

The LaserWriter Plus with revision 3.0 ROMs reports back that it has PostScript version 42.2. This is an error in revision 3.0 ROMs. PostScript version 47.0 is the actual version in the revision 3.0 ROMs.

The LaserWriter IIf, LaserWriter IIg, and Personal LaserWriter NTR have PostScript Level 2 in ROM. All other LaserWriter printers have PostScript Level 1 in ROM.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

LaserWriter: Apple IIe Card Only Prints 11-inch Page

Revised: 11/4/92
Security: Everyone

LaserWriter: Apple IIe Card Only Prints 11-inch Page

==========

Article Created: 20 December 1991

Article Change History

11/04/92 - REVIEWED
- For technical accuracy.

TOPIC ----------

I have a LaserWriter connected to a Macintosh LC with an Apple IIe Card. The LaserWriter uses the multipurpose tray. I configure the IIe Card software to use the Printer Port (slot 1) to print to the LaserWriter.

When printing a legal-size document in AppleWorks 3.0, I run into printing anomalies. If I specify a 14-inch page in AppleWorks and print the document on an ImageWriter II, the document prints on one page. If I print to the LaserWriter with legal-size paper in the tray, it prints 11 inches only and finishes the document (2 more lines) on the second page. The margin settings are .5-inch left and right, and 0 top and bottom.

DISCUSSION ----------

We've confirmed this anomaly and anticipate it will be corrected in a future release of the software.

At this point we can suggest no workaround.

System 7 LaserWriter Driver: How to Shrink PostScript Files

Revised: 7/23/92
Security: Everyone

System 7 LaserWriter Driver: How to Shrink PostScript Files

==========

Article Created: 15 January 1992
Article Last Reviewed: 16 July 1992
Article Last Updated: 16 July 1992

TOPIC ----------

With System 6, I could use Command-K to dump a PostScript image with Laser Prep, or Command-F to dump a PostScript file without Laser Prep.

With System 7, I can't seem to find a way to dump the PostScript file without the Laser Prep. Now an option in the print dialog allows me to select "Postscript File." This provides the same function as Command-K. But is there a way I can exclude Laser Prep as I did with Command-F?

Also, is there any way to make the generated PostScript file any smaller than it is?

DISCUSSION ----------

There is no Apple solution yet for generating PostScript files without headers under System 7. The latest improvement is the version 7.1 LaserWriter driver, which improves printing performance. But we don't have a solution to the problem of extremely large saved files.

The large saved file situation is caused by two major changes from the driver versions prior to 7.0 (excluding 6.1, which is really an old version of 7.0.):

- The addition of TrueType, and

- The need to prevent "laser wars."

TrueType fonts require the TrueType scaler on the destination printer. Because the driver doesn't know anything about the final destination when saving to a file, it saves everything that might be necessary. This can

add several hundred kilobytes to the file's size, and that's with only a couple of fonts. The scaler itself adds well over 100K.

Laser war problems at customer sites with several different driver versions motivated a change in the prep dictionary downloading. Prior to System 7, the first user to print downloaded their version of Laser Prep semi-permanently (outside of the server loop; remaining until a power cycle). Subsequent print jobs from other users would query the LaserWriter and see that the prep information already existed. If the query found an incompatible version, their prep dictionary replaced the existing one. If the existing version was compatible, everything worked fine. The prep dictionary is referenced from the LaserWriter driver's output as a library of procedures. If the referenced routines don't exist the print job will fail.

The System 7 method sends the prep information along with each print job. Since it isn't downloaded semi-permanently, it's always saved with a file because the information is still required. In addition to increasing the file size, this conflicts with non-Apple laser printers (usually connected to workstations or minis) that use substitute prep dictionaries. Since the prep dictionary isn't always present in the LaserWriter, the Command-F option wouldn't work anyway without adding the header code.

A shareware program called Trimmer allows you to select fonts you want excluded from saved files. It also allows the exclusion of the TrueType scaler. Trimmer also provides an option of excluding the Laser Prep header from the PostScript file, simulating the Command-F option from System 6.x. It provides a good way to eliminate unneeded data from saved files. But it's an unsupported non-Apple solution.

Ethernet LaserWriters: Change EtherTalk Default Zone (11/94)

Revised: 11/17/94
Security: Everyone

Ethernet LaserWriters: Change EtherTalk Default Zone (11/94)

==========

Article Created: 3 October 1991
Article Reviewed/Updated: 17 November 1994

TOPIC ----------

Does the utility software that comes with the LaserWriter IIg (which connects directly to Ethernet) allow the user to change the zone that the printer resides in?

Also with the LaserWriter Pro 630, Pro 810, and 16/600 PS is there a utility that can be used to change the zone?

DISCUSSION ----------

There are two utilities that will enable you to change the zones the printers are located in. Use the "Apple Print Utility" for the LaserWriter 16/600 PS, and place the printer's configuration switch in the up position for the zone change to be persistent between restarts. For the LaserWriter IIg, Pro 630 and Pro 810, use "LaserWriter Utility" v7.4.1 or later.

If you don't have LaserWriter Utility v7.4.1 or later, the utility included with the LaserWriter IIg doesn't have an option to select a zone when connected to an EtherTalk network that has more than one zone associated with it. You can change the zone that the LaserWriter IIg appears in with this PostScript code:

```
---Cut Here---
currentfile statusdict begin product (LaserWriter IIg) eq
version (2010.113) eq and end not
{save exch 291 string readstring pop pop restore} if
/ASCIIHexDecode filter /SystemPatch statusdict /emulate get exec
85f6ba98b8147bdb3c41fc154e390200521caba043febd65f48e008d42590001cd0f62e
4c9f2b841c6c1c85660f30002ba262234d72494f203c119951000000376b481858e01bff2
db172cf2ecfe000446e2f3ddca7b1fb2d27814e1c22e000598f64cae7bb9897afb760a5d8
1ac0106>
serverdict begin 0 exitserver
```

```
(%EtherTalk%) <</EtherTalkZone (YourZoneGoesHere)>> setdevparams
---Cut Here---
```

1) Copy all information between the "---Cut Here---" lines.

2) Paste the information into a text document.

3) Change the text "YourZoneGoesHere" in the last line to the new zone name.

4) Save the text document as a file.

5) Download the file with the LaserWriter Utility.

After sending this code, the LaserWriter IIg should appear in the new zone. If the zone name requested isn't valid for the EtherTalk network, the LaserWriter IIg uses "*" as the zone name and appears in the default zone. A valid zone name is a string of up to 32 characters, excluding the ":" and "@" characters.

Notes

For a LaserWriter to be in a particular zone:

1) The LaserWriter must be directly connected to an EtherTalk Phase 2 network via the built-in Ethernet port.

2) The zone in which the LaserWriter is to appear must be in the zone list for the physical cable (network) to which the LaserWriter is attached -- which, in this case, must be Ethernet. This is defined by the router for the physical cable.

Tip for Sending PostScript Code to a LaserWriter

An easy way to send PostScript code to a LaserWriter is to enter it into a TeachText or SimpleText document and download it using the LaserWriter Utility's Download PostScript File option. TeachText or SimpleText is included with Macintosh system software, and the LaserWriter Utility is included with the LaserWriter.

Article Change History:
17 Nov 1994 - Added information on LaserWriter Pro 630, Pro 810, and 16/600 PS.
17 Aug 1992 - Corrected the PostScript Hex Codes.

AppleTalk: Using Multiple Versions on Same Network

Revised: 2/5/92
Security: Everyone

AppleTalk: Using Multiple Versions on Same Network

==========

Article Created: 9 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

How many versions of AppleTalk can we run on a 20-Macintosh network? We currently have version 56 on most of the computers.

DISCUSSION -----

There should be no incompatibilities between various versions of AppleTalk. It's important to know that AppleTalk phase 2 was introduced with AppleTalk version 53.

AppleTalk version 56 introduced many bug fixes and should be the minimum version in use on any network with highly utilized servers or routers. Most of the bug fixes included in version 56 were related to crashes and other problems with nodes operating in a high stress environment.

Ethernet Transceivers: Require Hub Termination

Revised: 2/9/92
Security: Everyone

Ethernet Transceivers: Require Hub Termination

==========

Article Created: 13 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

We have problems selecting EtherTalk with the NB card, LC card, or built-in Quadra cards. The usual message is "An error occurred while trying to install the selected AppleTalk connections. The built-in LocalTalk port will be used instead."

We know that we have to plug in the transceiver before starting the Macintosh. Do twisted pair transceivers also require hub termination?

DISCUSSION ----------

The Ethernet NB card driver performs three loopback tests before enabling user services. If any one of these tests fail, the card won't allow you to use the attached network. The initial two tests check the card's internal communications paths. However, the third test performs a loopback test using external parts of the network. If any part of the external network fails to function properly (this includes 10baseT links), the test fails and your port switches to the built-in LocalTalk port.

Concerning 10baseT hub termination, you definitely need to have hub termination before the driver allows you to select user services.

System 7.0.1: Installing the Ethernet Driver

==========

Article Created: 13 January 1992

Article Change History

09/25/92 - REVIEWED
- For technical accuracy.

TOPIC ----------

We've had problems installing system software version 7.0.1 with a NEW Apple Ethernet board installed in the Macintosh. Here's what happens:

1) Upon clicking the installer, we don't get the list of EtherTalk drivers, and we have to choose customize.

2) After completing the installation, the system doesn't work with the new board. We then use the disk that comes with the Ethernet board to install the drivers and A/ROSE.

3) The driver from this disk doesn't work with version 7.0.1, so we must again use the 7.0.1 disk to install the correct Ethernet driver.

Can you suggest a better way to do this?

DISCUSSION ----------

To get the Ethernet NB card installed and working:

1) Install system software version 7.0.1.

Note: You must have the Macintosh connected to a working network before the driver lets the user services become active.

2) Then use the disk that ships with the Ethernet NB card (version 2.5.1)

to install the Ethernet driver.

3) Restart the Macintosh.

AppleShare 3.0: Using a Users & Groups File on Multiple Servers

==========

Article Created: 13 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I'm setting up several AppleShare 3.0 servers, and I'm having problems copying the Users & Groups File. I have an existing AppleShare 3.0 server up and running with over 100 users and groups in the database. This server is a Macintosh SE/30.

I'd like to use the Users & Groups file on a Macintosh IIci from the Macintosh SE/30 server. I can copy the file without problems. When I open up AppleShare Admin, it shows me the first server's name and asks me for the admin key. After I type the correct admin key, I get a list all of the users and groups. If I quit the Admin application and reopen it, I get the message, "The Users and Groups file is damaged."

How can I successfully copy the file?

DISCUSSION -----

Following are the procedures to use the same Users & Groups file for multiple servers:

1) Install and configure an AppleShare 3.0 server with a complete Users & Groups list.

2) Copy the saved Users and Groups file to a spare floppy disk.

3) Open the Preferences folder, located in the System Folder of the next system to have the server software installed. Drag the Users & Groups file to the Trash. Note: It won't let you delete the file from the Trash, but that's OK.

4) Copy the saved Users & Groups file from the floppy disk to the Preferences folder.

5) Insert the AppleShare 3.0 server disk and double click the installer icon to start the installation.

6) After server installation, you must restart the Macintosh.

7) Start the Admin program to automatically read in and use the saved Users & Groups file. In a short time you'll see the complete Users and Groups lists appear, and you can then proceed with any other specific server administration that you need to do.

You can quit the admin program and relaunch it with no problem. Once you're satisfied with the configuration, you can start the server by double clicking on the server application.

Macintosh System Software: Correct Responder Versions (3/94)

Revised: 3/31/94
Security: Everyone

Macintosh System Software: Correct Responder Versions (3/94)

==========

Article Created: 11 November 1991
Article Reviewed/Updated: 31 March 1994

TOPIC ----------

I support 2,500 Macintosh computers, and I'm using Inter•Poll to monitor the various systems. I can only access printer driver information on some of the computers.

It seems that only Responder version 2.0.2 works with system software version 6.0.7, and that only Responder 2.0 works with system software version 7.0.

I'm not sure where the various versions of Responder extensions are coming from on the System 7 computers. The Responder is built into the system, and I followed the same installation on all of the computers.

DISCUSSION ----------

Responder version 1.1.1 doesn't report any information for printer drivers if the 7.0 drivers have been installed on a System 6 Macintosh. Responder versions 2.0.2, 2.0.3, and 2.0.4 are the correct versions to use with this configuration (System 6 using 7.0 drivers), and will report back the correct printer driver information to Inter•Poll.

Before any Macintosh will report the printer driver information, you must first select a printer (driver) from the Chooser. You don't actually have to select a printer, just a printer type (that is, LaserWriter, ImageWriter, and so on), and then restart the Macintosh.

Another anomaly is that the 2.0.1 Responder is built in to System 7 and must be removed before any of the stand-alone versions (2.0.2, 2.0.3, and 2.0.4) will load and function. There's no real reason to remove the built-in Responder; this information is for education and possibly future testing purposes only. None of the current N&C installers will remove the 2.0.1

Responder resource from the System file. You must remove it manually before any of the stand-alone versions of Responder will load on a System 7 computer.

A good indication that the 2.0.1 Responder is installed as well as a stand-alone version is that the Responder icon will be X'ed out when the INITs (extensions) display their icons at startup time. The built-in Responder in System 7 is located in the AINI resource in the System file, resource number is 32000.

Here's a matrix that describes where each version of Responder comes from. This should help sort out why so many different versions are showing up on the BNR Internet and help you to get the correct versions installed on the systems.

Product	Responder Version
6.x	1.1.1 (This includes 6.0.8)
7.0	2.0.1 Built in to the System (Inter•poll reports it as 2.0)
7.0.1	2.0.1 (same notes as 7.0)
7.1	2.0.3 (same notes as 7.0)
Ethernet NB 2.5.1	2.0.2
ARA 1.0	2.0.3
NSI 1.0	2.0.3
NSI 1.1	2.0.3
NSI 1.2	2.0.3
NSI 1.2.1	2.0.3
NSI 1.3	2.0.4
NSI 1.4	2.0.4

Inter•Poll: System 7.0.1 and Printer Drivers

==========

Article Created: 20 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC -----

After I installed System 7.0.1 on a networked Macintosh, Inter•Poll 1.0.1 is unable to see or identify the LaserWriter driver on the 7.0.1 system. Is there a workaround for this?

To test:

1) Install 7.0.1 on a Macintosh on the network.
2) Start Inter•Poll on another Macintosh.
3) Choose System Information under the Special menu.
4) Click on the LaserWriter Driver Version radio button.

The 7.0.1 system won't show a LaserWriter Driver installed.

DISCUSSION -----

This isn't a problem. System 7.0.1 reports back the correct printer driver information without any modification or update to any system resources. Please read the information below.

Responder Information

Version 1.1.1 of Responder doesn't report back any information for printer drivers if the 7.0 drivers have been installed on a 6.x system. Responder versions 2.0.2 and 2.0.3 are the correct versions to use and will report back the correct printer driver information to Inter•Poll when installed on a system 6.x Macintosh that is using the 7.0 print drivers. Before any Macintosh will report the printer driver information, you must first select a printer (driver) from the Chooser. (You don't actually have to select a printer just a printer type, such as LaserWriter, ImageWriter, and so on.)

Then restart the Macintosh.

Another anomaly is that the 2.0.1 Responder is built into System 7 and must be removed before any of the stand-alone versions (2.0.2, 2.0.3) will load and function. None of the current N&C installers will remove the 2.0.1 Responder resource from the system. You must remove it manually before any of the stand-alone versions of Responder will load on a System 7 Macintosh. A good indication that the 2.0.1 Responder is installed as well as a stand-alone version is that the responder icon will be X'ed out when the INITs (extensions) are displaying their icons at startup time. The built-in responder in System 7 is located in the AINI resource. The resource number is 32000, size 4104.

Here is a matrix that describes where each version of Responder comes from. This should help to sort out why so many different versions are showing up on the BNR internet and help to get the correct versions installed on the correct systems.

Product	Responder Version
6.x	1.1.1 (This includes 6.0.8)
7.0	2.0.1 Built in to the System (Inter•Poll reports it as 2.0)
7.0.1	2.0.1 (same notes as 7.0)
Ethernet NB 2.5.1	2.0.2
ARAP 1.0	2.0.3

PowerBook Fax/Data Modem: Doesn't Pass Break Signal 8/92

Revised: 5/16/94
Security: Everyone

PowerBook Fax/Data Modem: Doesn't Pass Break Signal 8/92

==========

Article Created: 10 January 1992
Article Reviewed/Updated: 4 August 1992

TOPIC ----------

If you attempt to send a break signal to a remote host with the Macintosh PowerBook Fax/Data Modem, it won't pass the break signal to the host. Instead, it causes the modem to go back to command state.

How do you pass a break signal to the host without putting the modem into its command state?

DISCUSSION ----------

Unfortunately, any attempt to transmit a break signal with the Macintosh PowerBook Fax/Data Modem always results in the modem going into command state. It won't send the break signal to the host.

Many modems allow you to change break handling so you can determine whether the modem enters command state or simply passes the break signal. The PowerBook Fax/Data Modem doesn't do this.

PowerBook: Modem Connections After Using Fax 8/92

==========

Article Created: 10 January 1992
Article Reviewed/Updated: 4 August 1992

TOPIC ----------

After I send a fax with Apple's fax software v1.0.1, I'm unable to connect with on-line services like America Online with White Knight v11.12. In White Knight, I dial the number, the modems handshake, the dialing window clears, then I get a no connection message. Then I have to type a return several times to get any activity. When connecting via an external modem with the same software, I experience no problems.

DISCUSSION ----------

After sending a fax, the PowerBook modem is left with the Connection Mode set to "error control mode" (the modem's factory default, "&Q5"). This instructs the modem to make a connection using V.42/MNP. If the remote modem doesn't offer V.42/MNP, the modem falls back to standard asynchronous mode. During the fallback process, some remote modems, depending on how they're configured, may disconnect.

You can eliminate this problem by setting the PowerBook modem's connection mode to asynchronous mode, with no error correction protocol, via "AT" commands. From White Knight, MacTerminal, or any other terminal emulation program, simply enter AT&Q0 (zero, not the letter "O"), and press return.

From America Online, under the Go To menu, choose Customize Network Setup. In the Modem String field, enter &Q0. America Online will automatically insert the Modem String between the modem attention AT command and the dialing sequence. For example, assume you've configured America Online for tone dialing, you've entered the phone number 555-1212, and you've entered &Q0 as the modem string. The software would use the full dialing sequence AT&Q0DT555-1212.

Macintosh Classic II: Specifications (Discontinued)

Revised: 6/19/95
Security: Everyone

Macintosh Classic II: Specifications (Discontinued)

==========

Article Created: 21 October 1991
Article Last Reviewed/Updated: 20 September 1994

TOPIC ----------

This article gives technical specifications for the Macintosh Classic II computer.

DISCUSSION ----------

Microprocessor

- MC68030, 32-bit architecture, 16 MHz clock speed

Memory

- The Classic II 2/40 comes with 2MB of RAM on the logic board and two memory expansion slots for SIMMs (Single In-line Memory Modules).

- The Classic II 4/80 comes with 2MB of RAM on the logic board and two 1MB SIMMs in the expansion slots.

- Expandable to 10MB of RAM by installing SIMMs in the available slots (dealer installation required).

- 512K of ROM

Disk Drives

- Built-in Apple SuperDrive 1.4MB floppy disk drive

- 1/3 height internal 40MB or 80MB Apple SCSI hard disk drive

Video display

- Built-in 9-inch diagonal, high-resolution (512 by 342 pixels) bitmapped

monochrome display

Interfaces

- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other devices daisy-chained through a low-speed synchronous serial bus

- Two serial (RS-232/RS-422) ports, 230 kilobits per second maximum (up to 0.920 megabits per second if clocked externally)

- SCSI interface, using a 50-pin internal connector and a DB-25 connector for the first external device; all subsequent SCSI-based peripherals use standard SCSI-to-SCSI interface cables.

- 3.5-inch external floppy disk drive (800K or 1.4MB) interface

- Sound port for external audio amplifier or headphones

- Sound-in port for monaural sound input

- Internal connector for optional math coprocessor or ROM expansion

Keyboard

- ADB keyboard with numeric keypad

- Two-level tilt adjustment

Mouse

- Apple Desktop Bus Mouse, mechanical tracking, optical shaft or contact encoding: 90 to 110 pulses per inch (3.51 to 4.29 pulses per mm) of travel

Microphone

- Electret, omnidirectional; output voltage is 4 millivolts, peak to peak, at normal volume.

Sound Generator

- Monophonic 8-bit digital-analog conversion using 11- or 22-kilohertz sample rate, capable of driving stereo headphones or other stereo equipment through the sound jack

Clock/Calendar

- Custom chip with long-life lithium battery

Fan

- 10 cu. ft./min. axial

- Positive pressure cooling

Disability Access

- CloseView, Easy Access, and visible beep included with system software. These features and third-party options provide alternative input and output tools for people with disabilities.

Electrical Requirements

- Line voltage: 120 volts AC, RMS (nominal)

- Frequency: 47 to 63 Hz, single phase

- Power: 100 watts maximum

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 milliamps (a maximum of three devices is recommended)

- Mouse draws 80 milliamps.

- Keyboard draws 25 milliamps.

Size and Weight

- Main unit
  - Height 13.2 inches (33.6 cm)
  - Width 9.7 inches (24.6 cm)
  - Depth 11.2 inches (28.5 cm)
  - Weight 16 to 17.1 lb. (7.3 to 7.8 kg)*

- Mouse
  - Height 1.1 inches (2.8 cm)
  - Width 2.1 inches (5.3 cm)
  - Depth 3.8 inches (28.5 cm)
  - Weight 6 oz. (.17 kg)

- Keyboard
  - Height 1.3 inches (3.3 cm)
  - Width 16.0 inches (40.5 cm)
  - Depth 5.9 inches (15.1 cm)
  - Weight 1.96 lb. (.89 kg)

Operating Environment

- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)

- Storage temperature: -40 to 116.6 degrees F (-40 to 47 degrees C)

- Relative humidity: 5% to 95% noncondensing

- Maximum altitude: 15,000 ft. (4,722 m)

 * Weight is greater with internal hard disk.

Noise Level

  < 40db measured from the seated operator position.

PowerBook 170: Specifications (Discontinued)

Revised: 3/22/95
Security: Everyone

PowerBook 170: Specifications (Discontinued)

==========

Article Created: 21 October 1991
Article Reviewed/Updated: 22 March 1995

TOPIC ----------

This article gives technical specifications for the Macintosh PowerBook 170 notebook computer.

DISCUSSION ----------

Microprocessor

- 68030, running at 25 MHz
- 68882 math coprocessor, running at 25 MHz

Memory

- Comes with 4MB pseudostatic RAM, 2MB on the logic board and 2MB on a RAM expansion card that fits into a card slot.

- Expand to 8MB of RAM by replacing the 2MB expansion card with either a 4MB or 6MB RAM expansion card.

Disk Storage

- One built-in 1.4MB drive that uses high-density floppy disks; it reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks.

- One internal 40MB hard disk

Display

- 10 inch (254 mm) diagonal

- Backlit active-matrix liquid crystal display

- 640 by 400 pixels

Battery

- NiCad, 2.5 ampere-hours, provides 2 to 3 hours of use before recharging is necessary

- Recharge time: 100% recharged after 5 hours; 80% recharged after 3 hours

Keyboard

- Built-in keyboard with standard Macintosh layout

- Two-level tilt adjustment

Trackball

- dual button trackball, 30 mm diameter

Clock/Calendar

- CMOS custom chip with long-life lithium battery

Interfaces

- One Apple Desktop Bus (ADB) port for keyboard, mouse, and other devices using a low-speed, synchronous serial bus

- Two RS-422 serial ports for LocalTalk networking, printers, modems, and other devices

- One HDI-30 SCSI port for hard disks, scanners, CD-ROM drives, and other devices

- One sound output port for external audio amplifier

- One sound-in port

Modem

- Internal 2400-baud modem with fax send at 9600 baud; includes fax send software

- Error correction and compression: MNP 4,5 and V.42, V.42bis

Sound Generator

- Apple Sound Chip provides 8-bit sound capable of driving stereo headphones or other stereo equipment through the sound port.

Sound Input

- 8-bit sound, sampled at 11 or 22 kHz

Disability Access

- CloseView, Easy Access, and visible beep included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disability.

ADB Power Requirements

- Maximum current draw for all ADB devices is 50 milliamps (a maximum of three ADB devices is recommended)

Electrical Requirements

- Line voltage: 110 to 220 volts

- Frequency: 50 to 60 Hz

Environmental Requirements

- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)

- Storage temperature: -40 to +149 degrees F (-40 to +65 degrees C)

- Relative humidity: 20% to 80% noncondensing

- Altitude: Operating: 3048 m (10,000 ft.) maximum
Shipping (non-operating) 0 to 15,000 ft. (0 to 4,722 m)

Size and Weight

- Height: 2.25 inches (5.7 cm)
- Width: 11.25 inches (28.6 cm)
- Depth: 9.3 inches (23.6 cm)
- Weight: 6.8 lb. (3.08 kg)

Noise Level

Noise free except for floppy or hard disk use.

Article Change History:
22 Mar 1995 - Updated altitude information.
27 Aug 1993 - Revised to reflect correct storage temperatures.

PowerBook: Fax/Data Modems (8/92)

Revised: 5/16/94
Security: Everyone

PowerBook: Fax/Data Modems (8/92)

==========

Article Created: 2 December 1991
Article Reviewed/Updated: 5 August 1992

TOPIC ----------

I read that the Macintosh PowerBook Fax/Data Modem is only a SEND modem. Is it possible that clients can use it as a SEND/RECEIVE (Fax) modem? Can they use some third-party Fax software, such as Abaton, to do a SEND/RECEIVE function?

DISCUSSION ----------

The Macintosh PowerBook Fax/Data Modem is limited to Fax send only. It's a hardware -- not software -- limitation.

There are several third-party modems that support both Fax send and Fax receive. Here are some PowerBook Fax/Data Modem suppliers:

- Global Village Communication, Inc.

- PSI Integration, Inc.

- Lifetime Memory Products, Inc.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

AppleTalk Remote Access: Network Install from Hard Disk

Revised: 1/28/92
Security: Everyone

AppleTalk Remote Access: Network Install from Hard Disk

==========

Article Created: 16 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Can we install AppleTalk Remote Access from a hard disk and/or over the network instead of from the floppy disk? We've tried but have been largely unsuccessful.

DISCUSSION -----

One 1.44MB Disk

Here's how you create a "Net Install" version of AppleTalk Remote Access from one 1.44MB disk:

1) Create a folder called "ATRA Net Install" on your Macintosh hard drive.

2) Insert the AppleTalk Remote Access Installer disk.

3) Drag the floppy disk icon on top of the "ATRA Net Install" folder icon. This will create a folder called "Installer" within the "ATRA Net Install" folder and a copy of the contents of the floppy to the "Installer" folder.

4) Open the "ATRA Net Install" folder.

5) Open the "Installer" folder.

6) Change the name of the application inside from "Installer" to "Install"

7) Drag the files "Install" and "Remote Access Script" out of the "Installer" folder, to the root level of the "ATRA Net Install" folder.

Two 800K Disks

Here's how you create a "Net Install" version of AppleTalk Remote Access from two 800K disks:

1) Create a folder called "ATRA Net Install" on your Macintosh hard drive.

2) Insert the AppleTalk Remote Access Installer Disk 1.

3) Drag the floppy disk icon on top of the "ATRA Net Install" folder icon. This creates a folder called "Installer Disk 1" within the "ATRA Net Install" folder and a copy of the contents of the floppy to the "Installer Disk 1" folder.

4) Insert the AppleTalk Remote Access Installer Disk 2.

5) Drag the floppy disk icon on top of the "ATRA Net Install" folder icon. This creates a folder called "Installer Disk 2" within the "ATRA Net Install" folder and a copy of the contents of the floppy to the "Installer Disk 2" folder.

6) Open the "ATRA Net Install" folder.

7) Open the "Installer Disk 1" folder.

8) Drag the files "Installer" and "Remote Access Script" out of the "Installer Disk 1" folder, to the root level of the "ATRA Net Install" folder.

AppleTalk Remote Access: Need Phase 2 EtherTalk to Answer Calls

Revised: 1/28/92
Security: Everyone

AppleTalk Remote Access: Need Phase 2 EtherTalk to Answer Calls

==========

Article Created: 18 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC -----

At home, I have a (host) Macintosh IIci with Practical Peripherals 2400 baud modem attached to a LocalTalk network. It's running System 7, with file sharing enabled (one user belonging to one a group called Remote Developers). This user has remote dial-in, connect and link privileges.

At work:, I have a (host) Macintosh with a Practical Peripherals 2400 baud modem (modem port) attached to a Phase I Ethernet network using a Technology Works Ethernet (thin) card. It's running System 7 and has a direct Ethernet connection. This network consists of five Ethernets terminating at a cisco router. A number of KBoxes with LocalTalk networks are attached to some Ethernet segments. This Ethernet routes AppleTalk Phase I, IP and IPX packets. This network contains one AppleShare server, one QuickMail Server, and four Novell NetWare file servers.

When the host computer at home is set up to answer the modem, the computer at work can dial in, log on to file servers, and so on. This works fine with and without the call-back features enabled.

But when I attempt to configure the work computer to answer the modem, an error message says: "Sorry, the network connection you have chosen doesn't support AppleTalk Remote Access."

DISCUSSION -----

Technology Works Ethernet Cards (TechWorks NuBus cards) ship with Apple's EtherTalk software, both AppleTalk Phase 1 and Phase 2.

On a Phase 1 EtherTalk network, AppleTalk Remote Access allows you to place calls, but it WON'T allow you to answer calls.

..TIL09555-AppleTalk_Remote_Access-Need_Phase_2_EtherTalk_to_Answer_Calls_(TA47987).

You need to upgrade to Phase 2 EtherTalk to enable the Answer Calls or server option within AppleTalk Remote Access.

Macintosh: Troubleshooting Modem Connect Problems

==========

Article Created: 16 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I installed public domain telecommunications software on my Macintosh to use with my modem. After initiating a connection, the call is answered, but my system locks.

Can you give me some general troubleshooting tips to locate the problem?

DISCUSSION ----------

Here are some general troubleshooting tips:

- Ensure that the baud rate is set correctly.

- Ensure that the bit and parity settings are set correctly.

- Ensure that you're using a clean line.

- Try connecting to other services. Does this problem happen only with one service or with several?

- Try using a commercial telecommunications software package. Do you still have the problem?

PowerBook: How To Tell When Caps Lock Function Is Active (11/96)

Revised: 11/14/96
Security: Everyone

PowerBook: How To Tell When Caps Lock Function Is Active (11/96)

==========

Article Created: 6 December 1991
Article Reviewed/Updated: 13 November 1996

TOPIC ----------

Some of the Macintosh PowerBook series keyboards do not appear to have a Caps Lock function. How can this be?

Is there any visual indication of when the Caps Lock function is active?

What is the Caps Lock extension and do I need it?

DISCUSSION ----------

Macintosh Portable

The original Macintosh Portable has a locking Caps Lock key. It clicks and locks into place in the down position when active like the keyboard used with most desktop computers. The Caps Lock extension does not work on the Macintosh Portable.

Macintosh PowerBook Computers

None of the Macintosh PowerBook computers have a locking Caps Lock key. The Caps lock keys on these computers do not make an audible click when you press the Caps Lock key.

* Some PowerBook models have a green LED (light) on the Caps Lock key. If this LED is illuminated, the Caps Lock function is active.

* Some PowerBook models do not have an LED on the Caps Lock key. On these computers, when the Caps Lock function is active, an "up" arrow is displayed in the upper right corner of the Menu Bar next to the Balloon Help icon. If this arrow does not appear in the Menu Bar, the Caps Lock extension is probably not properly installed in the Extensions folder of the System Folder.

Connectix PowerBook Utilities

If you want another indicator in addition to the light on the Caps Lock key itself, you can get a piece of software called Connectix PowerBook Utilities (CPU) which gives an audible clicking sound from the speaker when the Caps Lock key is pressed (it also provides may other features).

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for any content pertaining to non-Apple products. Please contact the vendor (Connectix) for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:
13 Nov 1996 - Updated for clarity.
18 Aug 1995 - Added information about newer PowerBook Caps Lock functions.

LaserWriter: Troubleshooting Print Jobs That Don't Print (4/94)

==========

Article Created: 19 December 1991
Article Reviewed/Updated: 11 April 1994

TOPIC ----------

I am printing from a Macintosh on a network to a LaserWriter with Background Printing turned on. Intermittently, when I send a print job to the printer, it doesn't print. If I reselect the LaserWriter in the Chooser, the job prints.

DISCUSSION ----------

Here are some troubleshooting tips to help you locate the problem:

- Check the network for proper termination.

- Check the equipment and network for frayed or damaged wires and cables.

- If other Macintosh computers on the network are not having these printing problems, move your Macintosh to one of these known-good locations and try printing from there. If you still have the same problem, it's likely to be associated with your Macintosh.

- If other Macintosh computers on the network are having the same problem, try to eliminate the network as the source first. Connect the LaserWriter directly to a Macintosh (other than yours) and try printing from there.

  - If the problem persists, troubleshoot your LaserWriter.

  - If the problem is corrected, troubleshoot your network.

- If you are using a non-LocalTalk LaserWriter, such as the LaserWriter Select 310, make sure AppleTalk is turned off in the chooser. Also make sure that you are using a peripheral-8 cable (M0197LL/B) and not a LocalTalk or PhoneNet connetor.

- When using a serial LaserWriter check the chooser and verify that the proper port is selected.

Article Change History:
11 April 1994 - Added information on using serial LaserWriter printers.

TOPIC ----------

I am having a problem installing TokenTalk and EtherTalk NB cards on our Macintosh IIsi computers. We have not been able to get any of the systems up on the network.

DISCUSSION ----------

Without more detailed information about the problems you are experiencing, we can offer only some troubleshooting measures:

- Ensure that the network is properly terminated.

- If you are running System 6.0.7, ensure that the Network Product Installer is used to installed the Network CDEV and TokenTalk/EtherTalk drivers.

- If you have the Macintosh IIsi NuBus Adapter Card installed and the EtherTalk NB Card is properly installed, ensure that the jumper on the EtherTalk NB Card is set for BNC.

Macintosh: Troubleshooting Non-Functioning Mouse Control Panel

==========

Article Created: 20 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have a Macintosh Plus running system software version 7.0. I recently upgraded the RAM from 2.5MB to 4MB, and the Mouse control panel stopped functioning -- I no longer can change the tracking speed.

DISCUSSION ----------

Increasing the RAM should not affect system software version 7.0. This problem may be related to a third-party system extension (INIT) conflict.

Try removing all third-party system extensions (INITs), control panels (CDEVs), and DAs from your System Folder for testing purposes. Then reinstall the system software. If the problem is corrected, isolate the conflicting software by reinstalling the system extensions, control panels, and DAs one at a time until the problem reappears. Remember to allow an appropriate testing time between each installation.

If the problem persists, try zapping the PRAM by pressing and holding the Option-Command-P-R keys and restart your Macintosh.

Video Monitors: Why Some Screens Have Squared Corners

==========

Article Created: 15 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm using a Macintosh SE/30 to which I added an AppleColor High-Resolution RGB Monitor. I noticed something unusual about the monitor's display area: all corners, except the lower left, are rounded. The lower left has a squared (right-angle) corner. Is this a defect?

DISCUSSION ----------

This is not a defect nor is it peculiar to the AppleColor High-Resolution RGB Monitor -- we have seen these squared corners on other Apple and third-party monitors. It's just cosmetic and is more likely to happen when multiple monitors are connected to the computer.

Macintosh: Where To Find "Cache Switch" (9/94)

==========

Article Created: 9 December 1991
Article Reviewed/Updated: 19 September 1994

TOPIC ----------

Where can I get a copy of Cache Switch Control Panel for the Macintosh Quadra?

DISCUSSION ----------

The Cache Switch is designed for any of the 68040 computers. This includes certain models of the Macintosh LC, Centris, Quadra, and Performa computers. It is distributed on the Tidbits disk of System 7 and System 7.1. You can also get the Cache Switch on any of the online services that Apple posts software updates on.

The Cache Switch is not installed by the Installer, so you must drag a copy to the System Folder to install it.

These articles can help you locate software updates mentioned here:

- Where To Find Apple Software Updates
  Lists online services for "free" Apple software updates

- Obtaining Apple Product Support in the USA

Extended 80-Column Text Card: Function of Jumper J1 (11/96)

==========

Article Created: 17 December 1991
Article Reviewed/Updated: 14 November 1996

TOPIC ----------

What is the function of jumper J1 on the Apple IIe Extended 80-Column Text Card?

DISCUSSION ----------

Jumper J1 on the Extended 80-Column Text Card enables the use of double high-resolution graphics on the Apple IIe Rev.B main logic board.

Changes to Extended 80-Column Card Instructions
==========

The instruction sheet that comes with the Extended 80-Column card states that a "small plastic jumper" should not be installed on the 80-Column card if the number on the back of any Apple IIe main circuit board ends in an "A".

This is incorrect. The jumper should always be installed on the 80-Column card UNLESS the number on the main circuit board ends in "...0064-A". Other than this instance, every Extended 80-Column Card should have the jumper installed.

PowerBook: Keyboard and Keypad Sequences 7/92

==========

Article Created: 16 January 1992
Article Reviewed/Updated: 31 July 1992

TOPIC ----------

How do I send VT-100 keypad sequences to my mainframe application from the Macintosh PowerBook keyboard?

DISCUSSION ----------

If you are using the VT-102 tool (part of the Communications Toolbox) and MacTerminal 3.0, you can issue the keypad commands from the Keys menu. If you are using a Communications Toolbox-compliant application, you should be able to issue the commands from the menu the application provides for keypads.

If you are not using a Communications Toolbox-compliant application, you may need an application revision that works with the PowerBook. That is, the PowerBook keyboard has a new identifier* inside the Macintosh Operating System, and some applications may not map the mainframe key sequences from the keyboard.

You can use ResEdit to get the ASCII codes for the keypad, but more than likely, you want the key sequences that the mainframe requires. You could then create macros to issue them, or remap them to different keys if the application supports that.

*In particular, the PowerBook keyboards return selector identification codes of:

```
gestaltPwrBkADBKbd        = 12;   {PowerBook Keyboard}
gestaltPwrBkISOKbd        = 13;   {PowerBook Keyboard (ISO)}
```

for the Gestalt "kbd" selector. If your application uses Gestalt to determine the keyboard type, it may not check for this result (since it is new with the PowerBook) and may not do the correct mappings for the mainframe key sequences.

StyleWriter: Troubleshooting Ink Cartridge Problems

Revised: 1/21/92
Security: Everyone

StyleWriter: Troubleshooting Ink Cartridge Problems

==========

Article Created: 9 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

These print quality problems have been reported when replacing the StyleWriter Ink Cartridge:

- No print
- Light print
- White lines
- Smudging

DISCUSSION ----------

If your StyleWriter exhibits any of these symptoms, here are some things to check:

- Ensure that the orange tape and orange cap have been removed from the ink cartridge.

- Ensure that the black rubber boot isn't missing or twisted.

  The rubber boot is located below the home position of the ink cartridge.

- Ensure that you have powered down the StyleWriter using the Power button.

  Powering down the StyleWriter with the Power button caps the ink cartridge. Removing the Power Adapter Cord from the back of the printer will not cap the ink cartridge and may result in poor print quality.

- Ensure that you purge the ink cartridge five times before swapping the cartridge and/or modules.

Apple now recommends purging the ink cartridge five times to relieve any obstructions that may have worked their way into the nozzles during transit.

To perform a manual purge:

1) Turn the StyleWriter off with the Power button. (The printer must be turned off.)

2) Press and hold the Ready button.

3) Press the Power button once and release both buttons at the same time.

Wang and Macintosh: Document Transfer

Revised: 1/21/92
Security: Everyone

Wang and Macintosh: Document Transfer

==========

Article Created: 16 December 1991
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes different ways to transfer documents between Wang and Macintosh Systems.

DISCUSSION ----------

INTRODUCTION

The Macintosh can be connected to the Wang VS or OIS systems to provide two basic functions: document transfer and translation and terminal emulation.

Document transfer involves the sending of files between the Wang and the Mac. This process also involves translation -- that is, conversion of formatting attributes (like boldfacing, centering, tabs, and underlining) in the Wang documents to their equivalents in the Microsoft Word documents.

As for terminal emulation, the Macintosh can act just like a Wang 2110 VS terminal as long as it is connected to an Enhanced Asynchronous Device Controller (EADC) port on the Wang. This lets the user open a window, on the Macintosh, which is MultiFinder compatible and looks just like a Wang terminal screen. The Wang keyboard is mapped to the Macintosh keyboard, with some Macintosh user interfaces (mouse, pull-down menus, and so on) added for additional ease of use.

The following products provide 2110 terminal emulation: MacLink Plus/Wang VS and VsCom/Macintosh.

Physical Connections

Connections between the Wang system and its dedicated terminals are made

via a Wang proprietary coaxial cable. Although this cable is also usable by IBM-compatible PCs, it remains unusable by Macintosh computers.

To connect a Macintosh to the Wang system, use the RS-232 port on the Macintosh side (which can be connected directly to an RS-232 cable if within 50 feet of the Wang system, or via a modem if farther away).

On the Wang side, a number of ports are available:

- Asynchronous Device Controller (ADC): An 8- or 16- port RS-232 device designed for communication with Wang VS terminals.

- Enhanced Asynchronous Device Controller (EADC): Similar to the ADC, except that it also supports word processing.

- Telecommunications Input/Output Processor (TC-IOP): Provides limited access to Wang software applications, is less sophisticated.

- Multi-Line Telecommunications Controller (MLTC): Similar to the ADC, except that it is used on large Wang VS systems.

- Wang Asynchronous Controller System (WACS): Similar to the EADC, except that it is used on large Wang VS systems.

All these ports support most Wang functions, like communications with the Wang system, file transfer and conversion, and so on, but only the EADC and the WACS support Wang word processing on the Macintosh.

CONNECTIVITY SOFTWARE AVAILABLE

This section describes five transfer products (an asterisk indicates terminal emulation capability):

- MacLink Plus/Wang VS* and MacLink Plus/Wang OIS

- VsCom/Macintosh*

- Converse

- Smart Kid

MacLink Plus/Wang VS

Strengths

- Two-way file transfer and translation between Wang WP and Microsoft Word on the Macintosh

- VS 2110 terminal emulation (supports all Wang characters in the ADC/EADC version)

- Bidirectional copy/paste between Macintosh and Wang

- Multiple document transfer and conversion

- Includes a full set of PC-to-Macintosh translators

- Also includes the Allegro Server/VS FeaturePack, which provides:

  - Security subsystem to prevent unauthorized access to files

  - Document indexing subsystem to enable users to search for files on the basis of author, title, and other fields from the document summary (similar to the Wang summary)

  - Wang Office interface module that provides access to the mail and messaging functions in the Wang OFFICE. Note that it does not provide access to OFFICE's calendar and bulletin board capabilities.

Limitations

MacLink Plus/Wang VS does not support:

- Headers, footers, and footnotes during document conversion

- Background transfer/conversion of files

MacLink Plus/Wang OIS

Strengths

- MacLink Plus/Wang OIS transfers/converts files between Wang OIS and MS-Word on the Macintosh

- It includes a full set of PC-to-Macintosh translators.

Limitations

MacLink Plus/Wang OIS does not support:

- Headers, footers, and footnotes during document conversion

- Direct conversion to/from Wang WP Plus

- Background transfer/conversion of files

For details on MacLink Plus products, contact DataViz, Inc. You can find contact information in the Third Party Company Directory folder in the Tech Info Library.

VsCom/Macintosh

Strengths

- Provides basic document transfer/translation between Wang VS and Microsoft Word on the Macintosh: Supports both WP and WP Plus,

- Direct Wang Office interface: Simple one-step transfer of documents in and out of Wang Office mailboxes

- VS 2110 terminal emulation (supports all Wang characters)

- Bidirectional copy/paste between Macintosh and Wang

- Multiple document transfer and conversion

- Headers and footers supported in document conversion

Limitations

VsCom/Macintosh does not support:

- Background document transfer and conversion

- Footnote conversions

- No TC-IOP port version

For details on VsCom/Macintosh, contact M/H Group. You can find contact information in the Third Party Company Directory folder in the Tech Info Library.

Converse

Strengths

Converse provides simple document conversion and terminal emulation capabilities.

Limitations

Converse does not support:

- Multiple document transfer and conversion capability

- Terminal emulation

- Background transfer and conversion of documents

For details on VsCom/Macintosh, contact MacSoft. You can find contact information in the Third Party Company Directory folder in the Tech Info Library.

Smart Kid

Strengths

- Permits almost 100 percent file conversion including headers, footers, and footnotes.

- Very versatile: Works with a variety of systems and word processing formats.

- Toll-free telephone support.

Limitations

- Requires a Wang operator to send or receive files.

- Does not support background transfer and conversion of documents.

Comments

Smart Kid is a hardware and software product that handles file conversion between Wang VS or Wang OIS and a host of other computer systems, including Macintosh, IBM Displaywriter, Digital VAX, Xerox Memorywriter, and NBI OASys. It is a more expensive option, but, because of its sophisticated file conversion capabilities, it is sometimes chosen by companies that use long, heavily formatted documents.

For details on VsCom/Macintosh, contact MacSoft. You can find contact information in the Third Party Company Directory folder in the Tech Info Library.

System 6.0.x Installation (10/94)

Revised: 6/5/96
Security: Everyone

System 6.0.x Installation (10/94)

==========

Article Created: 17 January 1993
Article Reviewed/Updated: 17 October 1994

TOPIC ----------

To install System 6, follow these instructions in the order presented. These instructions apply to all versions of System 6 (6.0.1, 6.0.5, 6.0.7, and so on).

DISCUSSION ----------

REQUIRED DISKS

System 6 software comes as a set of 800K (double-density) disks or a set of 1.44MB (high-density) disks:

- The set of four 800K disks includes System Tools, Utilities 1, Utilities 2, and Printing Tools.

- The set of two 1.44MB disks includes System StartUp and System Additions.

The instructions in this document give the name of the 800K disk first, followed by the name of the 1.44MB disk in parentheses.

BACK UP FONTS AND DESK ACCESSORIES

Before you install System 6, back up your fonts and desk accessories. You can back up fonts and desk accessories using the Font/DA Mover. Or you can make a copy of the System file on a floppy disk, and remove the fonts and desk accessories later, using the Font/DA Mover.

PREPARE FOR A CLEAN INSTALLATION
---

1) Start up with the System Tools (or System Startup) disk. To do this, turn on your Macintosh computer. If your Macintosh is already

on, choose Restart from the Special menu.

2) Put the System Tools (or System Startup) disk into the startup floppy drive right after you hear the chime. The floppy disk icon appears in the upper-right corner of the desktop above the hard disk's icon.

   If it doesn't appear there, choose Restart from the Special menu. The disk ejects — push it back into the drive immediately.

3) Double-click your hard-disk icon to open it.

4) Double-click your System Folder to open it.

5) Drag the Finder and System files to the Trash, and choose Empty Trash from the Special menu.

INSTALL SYSTEM 6
---

1) Double-click the System Tools (or System StartUp) disk icon.

2) Double-click the Installer icon (not the Installer script). A welcome message appears.

3) Click the OK button. The Easy Install screen appears.

At this point you have two options:

- Easy Install, which installs the Macintosh system software and printer software recommended for your computer model.

- Customize Install, which lets you override the recommended software and choose exactly what items to install.

Note: You must use the Customize option to install AppleShare workstation software.

Easy Install
---

1) Click the Switch Disk button to select the disk where you want to install System 6.

2) Click the Install button to do the Easy Install.

3) Follow the instructions on the screen. Messages appear to prompt you for the proper disks. When installation finishes, a message appears.

4) Click the Quit button.

5) Choose Restart from the Special menu.

Customize Install

---

1) Click the Customize button. A screen appears.

2) Click the Switch Disk button to select the disk where you want to install System 6.

3) Select the items you want to install from the scrolling window. Hold the Shift key and click to select multiple items. Your selections appear beneath the scrolling window.

4) When you've made your selections, click the Install button.

5) Follow the instructions on the screen. Messages appear, prompting you for the proper disks. When installation finishes, a message appears.

6) Click the Quit button.

System 6 MultiFinder (10/94)

Revised: 6/5/96
Security: Everyone

System 6 MultiFinder (10/94)

==========

Article Created: 17 January 1992
Article Reviewed/Updated: 17 October 1994

TOPIC ----------

MultiFinder lets you have several programs open simultaneously, making it fast and easy to switch between them. You can print in the background and get the use of your Macintosh computer back faster. And you can allocate memory to programs, so you can get the most out of your available RAM.

With versions of System 6, the Finder is one of these programs. This means you don't have to quit the program you're running to work in the Finder.

DISCUSSION ----------

Setting up MultiFinder

You need at least 2 megabytes (MB) of Random Access Memory (RAM) to take advantage of MultiFinder. To run MultiFinder, the MultiFinder file must be in your System Folder. If not, copy it from your Utilities 1 disk to the System Folder on your hard disk.

You can launch MultiFinder from the Finder in System 6 by opening the System Folder and double-clicking on the MultiFinder icon. To set your system to launch MultiFinder each time you start your Macintosh computer, follow these steps:

1) Choose Set Startup... from the Special menu. A dialog box appears.

2) Click the MultiFinder radio button.

3) Click the OK button.

4) Choose Restart from the Special menu.

How to Tell If MultiFinder Is Running

To find out if you're running MultiFinder, open the Apple menu. If you're in MultiFinder, you'll see About MultiFinder... at the bottom of the menu. You'll also see application names below the desk accessories if they're loaded into memory.

Another way to tell is by looking at the far right of the menu bar. If you're in MultiFinder, you'll see either a small Macintosh icon, or an application icon. In addition, the About the Finder... window changes when you're running MultiFinder. It not only shows memory allocated to the System and Finder, but also to other programs loaded in RAM. You always want to see some white space for applications on this graphic barometer.

Switching Between Applications

MultiFinder lets you switch between applications in several ways:

- Choose the application name from the Apple menu.
- Click the small icon at the far right of the menu bar. Repeated clicking cycles through all the open programs.
- Click the visible portion of another application's window.
- Double-click an application icon, even if it's dimmed.

Memory Allocation

In MultiFinder, each application gets its own portion of memory that belongs solely to that application. Every application comes with a default amount of memory assigned to it, but sometimes you'll get a message that there isn't enough memory to run the program, or that the application has unexpectedly quit. You can fix this by changing the program's memory allocation.

1) Quit the application (no need to do this if the application has already quit).
2) At the desktop, select the application icon.
3) Choose Get Info from the File menu (or press Command-I). The Get Info window appears.
4) Select the Application Memory Size box.
5) Type a new number in the box. Make sure the number you use isn't less than the Suggested Memory Size. It's best to increase the memory size by only 50K to 100K at a time. You can always repeat the procedure if it isn't enough.
6) Close the Get Info window.

You can now launch the application again. The application will get this new memory size until you change it.

Note: When using MultiFinder with System 6, the Finder should get 250K as the minimum size. Use the Memory Allocation procedure to increase the Finder's memory. Restart so the new memory allocation takes effect.

Desktop Network Troubleshooting (10/94)

==========

Article Created: 12 November 1991
Article Reviewed/Updated: 27 October 1994

TOPIC ----------

This quick reference will help you diagnose common connectivity problems in your Local Area Network (LAN). With this information, you can fix the problem yourself, or give support personnel the most helpful information.

The topics include:
- Overview
- LAN defined
- LocalTalk/PhoneNET hardware
- Checking LocalTalk connections
- Checking the Chooser
- LocalTalk hints and help
- EtherTalk hardware
- Checking Ethernet connections
- Checking the Network Control Panel Device (System 6.0.x)
- Checking the Network Control Panel Device (System 7.x)
- EtherTalk hints and help
- Where to get more information

DISCUSSION ----------

LAN Defined

A Local Area Network, or LAN, is made up of computers and shared devices that are physically connected in a limited area. A shared device can be a LaserWriter printer, modem, file server, or print spooler. The two major network types discussed here are LocalTalk/PhoneNET (PhoneNET is a LocalTalk cabling system by Farallon Computing, Inc.) and EtherTalk.

LocalTalk/PhoneNET Hardware

A LocalTalk/PhoneNET network uses the following hardware:

1) Connector module

2) Standard phone cable

3) Terminating resistor

Checking LocalTalk Connections

Follow these steps to check LocalTalk connections:

1) Each Macintosh on the LocalTalk network should have the 8-pin (round) end of the connector module plugged into the Printer port.

2) Each shared device on the LocalTalk network should have the 8-pin (round) end of the connector module plugged into the Network (Ø≠) port.

3) Standard phone cables connect the computers and shared devices in a LocalTalk network. The box end of the connector module has two phone jacks. Either two phone cables, or one phone cable and one terminating resistor, should be attached.

Checking the Chooser

The Chooser can give you valuable information about the network. This section includes a list of questions to help you collect worthwhile information for support personnel. Select Chooser from the Apple menu, and the Chooser window appears. Here are the questions:

1) Is the AppleTalk Active radio button selected?

2) Do you see the AppleShare icon in the (upper-left) box?

3) Do you see any names in the file server (upper-right) box?

4) Do you see the name of the file server or shared disk you want in the file server (upper-right) box?

5) Do you see any zone names in the AppleTalk Zones (lower-left) box?

6) Do you see only a few zone names in the AppleTalk Zones (lower-left) box?

7) Do you see your zone name in the AppleTalk Zones (lower-left) box?

LocalTalk Hints and Help

If you're having problems, try these tips:

- Select Shut Down (not Restart) from the Special menu, wait 30 seconds, and then power on. This simple procedure often fixes the problem.

- Try swapping out the various hardware components (terminating resistor, connector module, and phone cable) one at a time.

WARNING: ALWAYS SHUT DOWN BEFORE MAKING ANY HARDWARE CHANGES.

- Re-install the AppleShare Workstation (System 6.0.x) or File Sharing (System 7.x) software.

Ethernet Hardware

An Ethernet network uses the following hardware:

- Ethernet NB Interface Card -or- built in Ethernet AUI (Attachment Unit Interface) port

- Ethernet (coaxial) cable -or- twisted pair (telephone) cable

- BNC T-connector -or- an Apple Ethernet NB Transceiver, often referred to as a "friendly-net connector". Apple Ethernet NB Transceivers are available in two varieties:

  Apple Ethernet Thin Coax Transceiver (M0329LL/A)
  Apple Ethernet Twisted Pair Transceiver (M0437LL/A)

Checking Ethernet Connections

Make sure the basic Ethernet connections are correct:

1) Does each Macintosh on the EtherTalk network have an EtherTalk Interface Card installed -or- is using the built Ethernet AUI port?

2) Does each Macintosh on the EtherTalk network have the BNC T-connector plugged into the round connector on the installed on the older EtherTalk NB Card -or- a Transceiver plugged into the AUI port on the newer Ethernet NB Card.

3) Check the jumper on the EtherTalk NB Card to ensure that the EtherTalk signals go out the right port (preset for AUI). The jumper area is located near the bottom end of the card near the connectors. There are three pins of which the jumper sets over two. With the EtherTalk NB Card face up, and the connectors to your right, when the jumper is on the left two pins the signal goes out the AUI port, and when the jumper is on the right two pins the signal goes out the BNC port.

   - EtherTalk NB Cards are shipped with the AUI port as the default.
   - The Apple AUI port, which looks similar to a video card port is slightly larger.
   - The BNC port. This is a round port, similar to a cable television cable plug.

4) Do the network LaserWriters and ImageWriter printers still use LocalTalk? (The EtherTalk network is joined to the LocalTalk network to access these printers by using either a bridge, or router.) See

steps 2 and 3 in the "Checking LocalTalk Connections" section.

5) Are coaxial cables connecting the computers and devices in the EtherTalk network? There should be a cable attached to each end of the BNC T-connector -or- the Ethernet Thin Coax Transceiver. If the computer is last on a particular Ethernet segment, the BNC T-connector a cable attached to one end, and a terminator attached to the other end.

6) Is the latest Networking software installed? Update your AppleTalk EtherTalk, or TokenTalk software using the latest version of the Network Software Installer disk.

IMPORTANT: You cannot use the older EtherTalk NB Card in a Macintosh Quadra or later. You MUST use either the on-board AUI port or the newer Ethernet NB Card.

Checking the Network Control Panel Device (System 6.0.x)

If you're running System 6.0.x, follow these steps to check your Control Panel device:

1) From the Apple menu, select Control Panel.

2) Click the Network icon and the Network window appears.

3) Is the EtherTalk icon selected? If not, click the icon name to select it.

4) Close the Control Panel window.

Checking the Network Control Panel Device (System 7.x)

If you're running System 7.x, follow these steps to check your Control Panel device:

1) From the Apple menu, select Control Panel.

2) Double-click the Network icon. The Network window appears.

3) Is the EtherTalk icon selected? If not, click the icon name to select it.

4) Close the Network window.

5) Close the Control Panels window.

EtherTalk Hints and Help

Keep these tips in mind when troubleshooting:

• Select Shut Down (not Restart) from the Special menu, wait 30 seconds, then power on again. This simple procedure often fixes the problem.

• Check that the Ethernet Interface Card is seated properly.

WARNING: ALWAYS SHUT DOWN BEFORE MAKING ANY HARDWARE CHANGES.

• Try swapping out the Ethernet Interface Card.

• Re-install the EtherTalk software from the latest version of the Network Software Installer disk.

Quick Reference: Using SmartForm Assistant

Revised: 2/9/92
Security: Everyone

Quick Reference: Using SmartForm Assistant

==========

Article Created: 15 November 1991
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This quick reference describes how to use Claris' SmartForm Assistant program. Use this application to print professional-looking forms with high-quality graphics and legible, accurate data. SmartForm Assistant forms are organized so you can enter data easily.

A form designer can program SmartForm Assistant forms to calculate automatically, to check the data you enter, and to provide help when you're filling in a form -- things you can't do with paper forms. You can also export the data in your forms to a database or spreadsheet application.

This quick reference is based on SmartForm Assistant 1.1v2, and covers these topics:

- Getting started

- Filling in a form

- Printing a form

- Using support features

- Managing a form set

- Where to find more information

DISCUSSION ----------

Getting Started with SmartForm Assistant 1.1v2

There are four ways to begin filling in a form using SmartForm Assistant:

- Double-click a form.

- Highlight the SmartForm Assistant application icon, pull down the File Menu and select the Open option.

- Double-click the application icon. SmartForm Assistant displays the Open file dialog box. Select the form you want to fill in from this list.

- If you have a set of forms already open, you can pull down the Edit menu and select Add Blank Form to create a blank form. Use this method if you need to fill in multiple copies of the same form in a single session. Also, use this method to create forms requiring unique form numbers.

Note: Throughout this quick reference document, Command-key equivalents are shown in parentheses ( ). You can press these instead of going to menus to select options.

Filling in a Form

Here's how to fill in a form:

1) After you have gotten started with SmartForm Assistant, choose the appropriate form.

2) Once the form set is open, pull down the Edit menu and select Add Blank Form (Command-A). This adds a blank form to your set of forms.

3) Type in the required information. Use the Tab and Shift-Tab (backwards tab) to move from field to field. If you have any difficulties, see the section below, "Using Support Features" for on-line help.

4) When you complete the form, save the information to your hard disk or floppy for archiving purposes. You are ready to print your form(s).

Printing a Form

1) Pull down the File Menu and select Print (Command-P). If a form requires you to print multiple copies, click the "Print with part labels" option in the print dialog box.

2) You can print The Current Form, All Forms, or Visible Forms. Make your selection by using the pop-up menu on the print dialog box. The choice defaults to Print Current Form.

Using Support Features

This section explains two categories of Support Features:

- Intelligent Assistance, which deals with things you need to know immediately.

- General forms Assistance, which contains information needed by more advanced users.

Intelligent Assistance

SmartForm Assistant provides three types of intelligent assistance. These are menu items that help you fill in forms quickly and accurately. These include Format Help, Support window, and Choices window.

- Format Help dialog box. This feature describes the different types of entry formats. SmartForm Assistant provides Format Help on all forms. The form designer must provide Support and Choices, which vary among forms.

  Format Help dialog box. The Format Help dialog box provides a concise explanation of the correct entry formats for each data type. The form designer can define a field as one of ten data types: text, decimal, integer, date, time, name, phone, international phone, logical, or picture. To display the Format Help dialog box, pull down the View menu and select Format Help... (Command-?) after you open a form.

- Support window. This feature describes the type of information to enter. The form designer can also provide custom help messages and custom error messages for each field in a form. These messages apply to the selected field and appear in the Support window. To display the Support window, pull down the Windows menu and select Show Support (Command-H).

- Choices window. This feature lists choices for the selected field. After selecting or tabbing to a field, you can enter data into it by typing, by pasting from the Clipboard, or by selecting an option from the Choices window. As with the Support window's help and error messages, choices are not built into all forms; the form designer must provide them. Some forms, or fields in a form, may not have choices associated with them.

  To display the Choices window, pull down the Windows menu and select Show Choices (Command-Y). You can select items from the Choices window by:

  - Selecting an item in the choice list and then clicking the Select button.

- Double-clicking an item in the choice list.

- Pressing the Command-key equivalent corresponding to the choice you want (Command-key equivalents for the first 10 choices are always Command-1 through Command-9, then Command-0).

General Forms Assistance

Beyond the intelligent assistance provided by Format Help, Support, and Choices, the following features help ease data entry and provide information about the form or its data. These include Name Options..., the Form Info window, the Form Set Info window, and the Auxiliary window.

- The Name Options... dialog box shows prefixes and suffixes (like Mister and Senior) that help SmartForm Assistant interpret acceptable entries in a Name field. It also controls how SmartForm Assistant displays your accepted entry. Some prefixes and suffixes also have abbreviations (Mr. and Sr., for example) and alternate abbreviations (Mr and Sr), which you can view in the Name Options dialog box.

  To display the Name Options dialog box, pull down the View menu and select Name Options... The "Built-in" card displays name options for all forms; the "User-defined" card displays them for a specific form set; the "Library" card displays a list of name options that you define (for example, making Research Engineer, Researcher, or R.E. acceptable).

- The Form Info window displays data about the form with which you're working. The Form Info window displays the Form Name, number, and the creation and last modified dates for the current form. It also includes a field into which you can enter comments about the current form. To display the Form Info window, pull down the Windows menu and select Show Form Info (Command-T).

- The Form Set Info window, displays data about the current form set. The Form Set Info window displays the date the Form Set was created and last modified and information about the Source Form (the form created in SmartForm Designer). It also includes information about the total number of forms in the set, number of visible forms, and number of hidden forms. To display the Form Set Info window, pull down the Windows menu and select Show Form Set Info (Command-M).

- The Auxiliary window is an extra page, consisting of information that will not be printed with the rest of the form. The Auxiliary window contains extra information that SmartForm Assistant does not print. To display the Auxiliary window, pull down the Windows menu and select Show Auxiliary (Command-U).

Managing a Form Set

When you have a number of forms to keep straight -- as with numerous weekly

expense reports in the same file -- you can search through old forms and manage forms more easily with the controls First Form, Next Form, Previous Form, and Last Form. These items are in the View Menu. When you want to view a different form in the set, use these menu items to move through the form set.

Find Forms...

This is used to find a specific form. To find a form, pull down the View Menu and select Find Forms... (Command-F) and a blank form will appear. Determine which field you want to search on and enter the search criteria into that field. To find a form that was created on 7/25/88, you'd enter 7/25/88 as the search criteria in the date field and then click Find in the find dialog box. To find a Facilities Work Request form for reconfiguration of cubicles, you would open the Facilities set of forms, pull down the View menu and select Find Forms..., and enter "reconfigure cubes" in the comments field. The program would find the form in which you entered "reconfigure cubes" in the comments field.

Hide Current Form, Swap Hidden-Visible, or Show All Forms

These menu options are used to manipulate forms in a set after you have searched for a form(s). Suppose you fill in forms for John Doe and Sally Smith. There are 10 forms in the set with John's name, and 5 with Sally's name. Sally has just asked you to print all of her forms. You would pull down the View Menu, select Find Forms..., enter = Smith and click Find on the dialog box. You'd now have 5 forms visible and 10 forms hidden. Now you pull down the File Menu, select print and choose Print Visible Forms from the pop-up menu.

If you wanted to see all of John's forms, you'd pull down the View Menu and select Swap Hidden-Visible (Command-J). John's 10 forms would be visible and Sally's 5 forms would be hidden.

Collect...

The Collect feature lets you take a form that you've already filled out and collect all similar forms to create a form set. For example, if you created 15 Vacation Leave forms, you have 15 different files. If you wanted to examine the one you filled out last week, you'd have to search through your hard drive and open that file. But, using SmartForm Assistant 1.1v2, you open one of those Vacation Leave forms, pull down the File menu and select Collect. Select the folder that has the 15 vacation forms in it and Collect forms into "the current [front-most] set". Watch the dialog box compare each file and collect the ones that match the type of form that is open. This gives you a set of 15 vacation forms.

You can also collect forms by launching SmartForm Assistant, pulling down the File Menu, selecting Collect, choosing the file you want to collect, and clicking Collect forms into "a new set of forms". The application will

search for all the files that match the chosen form type.

MacX 1.1.7 Font Error

==========

Article Created: 20 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I've encountered a problem using MacX 1.1.7 and MacTCP 1.1 on a Macintosh IIfx using system software versions 6.0.5 and 7.0. I used it to display the Euclid program (CAD 2D and 3D). After launching the program, I got the message:

"X Toolkit Warning: Cannot convert string "-*-MENU-MEDIUM-R-Normal--*-120-*-*-P-*ISO8859-1" to type FontList, using fixed point."

Do you have any suggestions?

DISCUSSION -----

Here are some possible causes of this problem:

- The proportional font "-*-MENU-MEDIUM...." doesn't exist in the Font Directory file or MacX Fonts folder. Select Fonts from the Edit menu to verify that this font exists.

- The Font Directory file might be out of sync due to improper removal of fonts or font aliases.

We suggest that you reload the MacX fonts from the MacX 1.1.7 distributed disks, (especially the "Font Directory"), and launch MacX again.

AppleTalk Remote: Troubleshooting Inability to Reach TCP/IP Host

Revised: 9/28/92
Security: Everyone

AppleTalk Remote: Troubleshooting Inability to Reach TCP/IP Host

==========

Article Created: 24 December 1991

TOPIC ----------

We're using MacTCP with a Macintosh on Ethernet configured for TCP/IP (as opposed to AppleTalk - encapsulating IP with DDP). This works fine. When using AppleTalk Remote Access however, the Macintosh that is dialing in must use AppleTalk (since the link is AppleTalk only).

When we configured MacTCP on the PowerBook, we chose AppleTalk and the LocalTalk side of a FastPath 4 that was configured to route TCP/IP. This K-box works fine for Macintosh computers on LocalTalk. With AppleTalk Remote Access, however, we can't reach a TCP/IP host. We get a "host not found" message. In addition, when we configured MacTCP on the host Macintosh (sitting on Ethernet) for AppleTalk encapsulation of IP, we couldn't reach the host either.

Since I always used just the TCP/IP configuration of MacTCP before, I'm not sure what is going wrong. Is there something in the K-box we need to change? Something in the MacTCP configuration?

Configuration:
- Macintosh IIci
- MacTCP 1.1
- System 7
- Apple Ethernet (old) card
- Shiva FastPath 4

DISCUSSION ----------

First you should make sure the FastPath is running either K-Star or KIP. If it's using the default ROM code, you won't be able to use it as a DDP/IP gateway.

Next you should verify the configuration:

- Check to see if the DDP/IP gateway was configured at all. You should see a startup message in the log or diagnostics windows that begins with "KSTAR FastPath ..."

- Check that there are IP addresses assigned for either static or dynamic allocation, or both. Verify that the IP address, default router, and subnet mask fields are configured properly.

- Verify that option 7 is turned on; this allows the Fastpath to respond to NBP lookups for "IPGATEWAY" from both the LocalTalk and Ethernet interfaces. We suspect that option 7 may be your culprit. KSTAR 8.1.1 hard wires option 7 on, so you don't have to worry about it if you're using 8.1.1.

You could use Inter•Poll to verify that the FastPath was advertising DDP/IP services. Perform a lookup for all nodes of type "IPADDRESS" Every node assigned a DDP/IP address will respond including the FastPath itself. The router should respond with something like:

Net	Node	Name	Type	Zone
1	220	192.11.0.200	IPADDRESS	LocalTalk

If you then do a lookup for all nodes of type "IPGATEWAY" you should see only the router respond, no end nodes, and hopefully only one router per zone.

Net	Node	Name	Type	Zone
1	220	192.11.0.200	IPGATEWAY	LocalTalk

By default it will only respond to lookups that are directed from the LocalTalk port. If option 7 is enabled, the FastPath will respond to lookups from the Ethernet port, but only if they are directed to the zone for which the LocalTalk port is configured. For example, assume you have a FastPath, with the LocalTalk port configured for zone "LocalTalk," and the Ethernet port configured for zone "EtherTalk." You must select the zone "LocalTalk" when you configure the DDP/IP gateway location in the MacTCP control panel from an Ethernet attached Macintosh, or from a remote LocalTalk attached Macintosh. If you don't select "LocalTalk," the FastPath won't respond to lookups for "IPGATEWAY." The key here is to select the correct zone, the zone configured for LocalTalk interface of the FastPath.

In their documentation, Shiva is a little more restrictive. They specify that the Ethernet port of the FastPath must have the same zone included in its zone list as the zone configured on the LocalTalk interface. They also specify that all nodes managed by a single gateway MUST be in the same zone as the LocalTalk interface for this gateway. The DDP/IP gateway as a whole isn't a documented standard. As long as you use only dynamic assignment, you shouldn't have any problem with the scheme outlined above. With version 8.1.1 of K-STAR, it looks like you should be able to use this type of scheme with static addresses as well. I haven't tested this, but the documentation included with 8.1.1 seems to indicate that they've made some

significant improvements to address assignment.

From the K-STAR 8.1.1 release notes:

Changes made to K-STAR to avoid dynamic IP addresses that are still in use from being given away are:

a. IP in AppleTalk traffic from each Macintosh is used to reset the aging timer.

b. While entries idle (those which have not sent an NBP reply for its IPADDRESS, or any IP traffic) for over 5 minutes will be considered for reuse; the FastPath will send directed IPADDRESS NBP lookups to the Macintosh for 10 minutes after the last response was seen.

c. The FastPath performs a wild card IPADDRESS lookup in the local (LocalTalk) zone every 30 minutes.

d. Previously, the FastPath would hold an IP packet for an address in its client range for up to 30 minutes in the hope that the client would respond to the (initial) NBP ARP. The FastPath no longer holds such packets.

e. Previously, the FastPath stopped keeping track of how old entries were after 30 minutes. Now times are kept up to 2^15 seconds (over 9 hours) to better distinguish between old and very old entries when deciding which entry to reuse.

f. The FastPath will only respond to "NBP PROXY ARPs" (Mac sends an IP ARP request by doing an NBP lookup for type IPDARESS, name xx.xx.xx.xx) if they originate from a Macintosh which is a registered client. This enables two FastPath IPGATEWAYs to coexist in the same zone. Since 2 IPGATEWAYS can coexist, the FastPath now always responds to IPGATEWAY lookups; this is as if option 7 was always enabled.

Finally, take a look at the TCP/IP configuration of the remote Macintosh as well as the Ethernet based Macintosh that also failed. What do they have in the way of configuration data? What zone are they pointed to for the DDP/IP gateway lookup? Are they configured for "Server" node address access? What zone do they reside in? Have you tried static address assignment?

Personal LaserWriter NT: Minimum Margin Reduces Lines Per Page

Revised: 1/30/92
Security: Everyone

Personal LaserWriter NT: Minimum Margin Reduces Lines Per Page

==========

Article Created: 21 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have a Macintosh LC with 2MB RAM and an HD40 SC running system software version 6.0.8. I have an Apple IIe Card installed and am printing to a Personal LaserWriter NT from AppleWorks and Publish It.

When printing, the print starts an extra half-inch down the page, thereby misaligning subsequent pages -- the last page of one print job I measured had a top margin of 4 inches.

Is there a compatibility problem with the Apple IIe Card and the Personal LaserWriter NT?

DISCUSSION ----------

This indicates that software is not properly configured for the correct number of lines per page. The Personal LaserWriter NT has a minimum margin that reduces the number of available lines per page to 61 from the usual 66 lines for an 8.5x11 page. Configure your software accordingly.

The Apple IIe Card version 2.0 software uses the printer driver in the Macintosh System Folder. Ensure that you have the Courier 10-point font installed.

System 7: File Sharing Is Not the Same as AppleShare File Server

Revised: 9/10/92
Security: Everyone

System 7: File Sharing Is Not the Same as AppleShare File Server

==========

Article Created: 10 January 1992

Article Change History

09/10/92 - REVIEWED
- For technical accuracy.

TOPIC ----------

I have a Macintosh running system software version 7.0 and sharing one folder. No one uses this computer; it acts as a file server only. The folder sharing function works fine with up to 10 users logged on. However, when an eleventh user tries to log on, one of these two messages appears:

- File server will not allow any users to log in. Try again later.
- Too many AppleTalk connections in use. Try again later.

The documentation says that up to 250 users are allowed per System 7 server.

DISCUSSION ----------

Your Macintosh SE/30 is not a dedicated server. It is a system running the system software version 7.0 file sharing option. With that configuration, you are limited to 10 users.

To make the Macintosh SE/30 a dedicated file server, you need to install and run the AppleShare File Server software.

Apple IIGS: Apple GS/OS 6.0 Supports the StyleWriter (7/94)

Revised: 7/6/94
Security: Everyone

Apple IIGS: Apple GS/OS 6.0 Supports the StyleWriter (7/94)

==========

Article Created: 21 January 1992
Article Reviewed/Updated: 6 July 1994

TOPIC ----------

Can I use the StyleWriter with an Apple IIGS?

DISCUSSION ----------

To use Apple GS/OS with the StyleWriter you need GS/OS 6.0, a hard drive and at least 1 megabyte of memory (more is preferred).

Earlier versions of Apple GS/OS do NOT support the StyleWriter.

Known Problem

- AppleWorks GS prints to the StyleWriter printer with GSOS 6.0. At full resolution of 360 dpi, however, full justification will not work and causes problems with spacing between words.

Work Around

- Choose half resolution (180 dpi), then full justification works.

Article Change History:
6 July 1994 - Added known problem.
5 May 93 - Revised to include hard disk and memory information.

TOPIC -----

Can I connect an Apple Daisy-Wheel Printer to an IBM PS/2/30? If yes, what are the cable pinouts?

DISCUSSION -----

Yes, you can connect an Apple Daisy-Wheel Printer to an IBM PS/2/30. You may have a problem with a driver, though. Try setting your applications to print to a Qume-type printer.

Here's the cable pinout information for connecting an Apple Daisy-Wheel Printer to an IBM PC, XT, or PS/2 series:

IBM RS-232 Serial (DB-25 -- Female Connector)	Apple Daisy-Wheel Printer (DB-25 -- Male Connector)
1	1
2	3
3	2
4,5	8
6	20
7	7
8	4,5
20	6
22	N.C.

Reference:

```
RS-232 Signal (DB-25 .. DTE)
 1 - Sig Gnd        - Normally Shield or Chassis Ground
 2 - TXD            - Transmit Data
 3 - RXD            - Receive Data
 4 - RTS            - Request to Send
 5 - CTS            - Clear to Send
 6 - DSR            - Data Set Ready
 7 - GND            - SIGNAL Ground
 8 - DCD            - Data Carrier Detect

Pers LaserWriter LS: Minimal Gain From Memory Upgrade (11/94)

==========

Article Created: 20 January 1992
Article Reviewed/Updated: 11 November 1994

TOPIC ----------

I recently had the RAM in my Personal LaserWriter LS upgraded from 512K to 1MB, and I haven't noticed any performance improvement. When I added RAM to my Texas Instruments MicroLaser printer, there was a definite performance improvement.

What does the RAM upgrade do for the Personal LaserWriter LS?

DISCUSSION ----------

Upgrading the Personal LaserWriter LS RAM does not provide a quantum improvement in performance because there is no processing capability on the printer I/O board, this is all handled by the computer to which the printer is connected.

The Personal LaserWriter LS I/O board only unbands the image as it is sent from the computer. Adding more RAM allows the printer to accept slightly larger documents.

A better way to improve Personal LaserWriter LS performance is to add RAM to or increase the performance of the computer to which the printer is connected.

A/UX 3.0: Installer Update Feature

==========

Article Created: 3 January 1992
Article Last Reviewed: 3 July 1992
Article Last Updated:

TOPIC ----------

This article explains the A/UX 3.0 Installer update feature.

DISCUSSION ----------

With A/UX 3.0, you can do an automatic update of A/UX from version 2.0 or version 2.0.1 if your disk has a minimum of 30MB of free space, and if your partitioning scheme matches that of A/UX 3.0. The free space accommodates the increased size of the A/UX file systems. If your system doesn't meet these two criteria, then we offer two updating utilities. These are similar to the utilities provided with earlier versions of A/UX to find files that need updating and to help you back up those files. Then when you install A/UX 3.0, it repartitions your disk and copies back your system and user files.

The A/UX 3.0 Installer updates existing A/UX 2.0 and 2.0.1 installations to 3.0 in the same manner as the installer used in A/UX 2.0.1. Basically, if the target disk is already set up for A/UX, it skips the disk formatting stage. During the UNIX package installation, outdated 2.x files are REPLACED by their newer 3.0 counterparts. The sizes of these replaced files are used in the free space calculation so that an enormous amount of free space isn't required.

As always, the installer IS NOT a substitute for backing up your disk drive. Make a habit of backing up daily or weekly to ensure the protection of your user files, and any changes you make to the system software.

In addition, A/UX 3.0 continues to support the Autorecovery feature. This feature allows you to recover key system files and get the A/UX computer back into a stable state.

Macintosh LC: No NTSC Video-Out with Apple IIe Card

==========

Article Created: 6 January 1992
Article Last Reviewed: 2 June 1992
Article Last Updated: 2 June 1992

TOPIC ----------

I have a Macintosh LC with an Apple IIe Card. My problem is that the Macintosh LC doesn't have any composite video-out equivalent to the Apple IIGS and Apple IIe systems that I need for projection.

Do you know of any RGB-to-NTSC converters for the Macintosh LC in Apple IIe mode?

DISCUSSION ----------

There is no way to have NTSC-out on a Macintosh LC if an Apple IIe Card is installed. RasterOps, Truevision, or the Computer Video RGB-to-NTSC converters won't work because they require an RGB signal with NTSC timing. The Macintosh LC doesn't have this kind of video port (that is, it doesn't have NTSC sync timing rate built into the board).

Here are two workarounds:

- Use an Apple IIe or Apple IIGS as your NTSC projection system.

- Use an LCD overhead projection panel compatible with the Macintosh LC. Any panel compatible with the 12-inch monochrome or 13-inch RGB monitor will work with the Macintosh LC video port. This solution has the advantage of being a Macintosh environment projection device. We are unaware of any LCD projection panels compatible with the 12-inch RGB monitor.

Another option is using a video card such as the Spectrum/8 LC Card. You have used the slot, but now have a video board that supports not only large screen monitors, but also supports video-out with the addition of the RasterOps video

expander or the Computer Video NTSC encoder. It gives you 256-color graphics for the Macintosh LC. This still doesn't allow for both the Apple IIe card and NTSC video-out.

The Spectrum/8 LC Card supports the following displays:

- SuperMac 19-inch Platinum Display
- 21-inch Platinum Two Page Display
- 16-inch Trinitron Display
- 19-inch Dual-Mode Trinitron Display
- 19-inch SuperMatch Color Display
- 21-inch SuperMatch Two Page Color Display
- Apple 12-inch RGB
- Apple Color 13-inch
- Apple Macintosh Portrait Display
- Apple 21-inch Monochrome
- RasterOps 19-inch
- Radius 19-inch (1152 x 882)

Security: Everyone

MacX: Compile Font from BDF File to Make It Usable

==========

Article Created: 23 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

We're using MacX with AIX on an RS6000. Our environment includes NDC X Terminals and PCs running X-Vision from VisionWare. We use WordPerfect on the RS6000.

Some of the fonts are causing problems. In particular, MacX erroneously interprets lines as bogus characters. Here is an example of a font description:

```
bld17.500.snf   -ibm--bold-r-block--23-16-100-100-m-110-ibm-pc850
```

Does Apple have anything that corresponds to these fonts? How do we map in to them?

DISCUSSION ----------

Apparently, the MacX client is requesting a font that doesn't exist in the MacX server.

We suggest the following:

- Use software called "snftobdf" to convert an SNF (Server Natural Format) file into a BDF (Bitmap Distributed Format) file.

- After converting the file to Bitmap Distributed Format, compile it by Font Directory under MacX. It will produce a font in a format the MacX server can use. For more detailed information on how to compile a BDF file within MacX, see page 101 of Apple MacX User's Guide, "Compiling fonts from BDF files."

You must store all available fonts in the MacX Fonts folder, and the MacX Fonts folder must reside either in the System Folder or in the same folder as the MacX application.

MacX: Default Font When Client Software Doesn't Specify

==========

Article Created: 28 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What is the default font that MacX uses if the client software doesn't specify a font?

DISCUSSION ----------

If the X client application doesn't specify any font to use, the MacX server looks for the "fixed" font. See page 115 of "Apple MacX User's Guide" for details.

Note that even if the X client doesn't specify the font name on the client's command line, the client can still look for some default places in the client host (like .Xdefaults file in user's home directory and the /usr/lib/X11/app-defaults file) for resources. These files store application and machine-specific resources. The details about how the X resources are referenced can be found in most X11 reference documents, such as the one on page 10 of X(1) manual pages in "X11 Reference for A/UX."

StyleWriter: Use Driver 7.1 with IIe Card Software 2.0 and 2.0.1

==========

Article Created: 29 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

We installed the new StyleWriter drivers and they work great on the Macintosh. However, we can no longer print from an Apple IIe card. We have a Macintosh LC 4/80 running AppleWorks 3.0 on the IIe card. We had no problems printing until we installed our driver update. The computer seems to communicate with the printer, then the computer locks up, and we have to restart.

DISCUSSION ----------

If the new StyleWriter drivers are version 7.2 or 7.2.2, the recommendation is to use version 7.1 StyleWriter drivers with the Apple IIe Card software version 2.0 and 2.0.1. The 7.2 and 7.2.2 versions of the StyleWriter drivers haven't been tested with the Apple IIe Card software versions 2.0 and 2.0.1.

ImageWriter & Excel 3.0: Fix for Problem Printing from Finder

==========

Article Created: 24 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm having problems printing multiple documents from a Macintosh Classic to an ImageWriter II. I'm using Excel 3.0 . In the Macintosh Reference Guide, on page 123, it tells how to print multiple documents.

After selecting all documents and choosing Print from the File menu, I select the ImageWriter II settings, which are: Faster/ All/ 1 Copy and Automatic. From the Desktop, each document opens, prints, and then closes in the order selected.

After each page, the top margin drops and continues to drop on every page. Also, after the first document prints, a dialog box asks you to insert the next sheet of paper. After clicking OK, the next page prints. The dialog box doesn't come up after every document, and randomly comes up when printing a multiple page document.

I reloaded system software, ImageWriter driver, and Excel 3.0. This doesn't help. I then printed the multiple documents to a LaserWriter II rather than to an ImageWriter II. Each document opened, printed, and closed in the order selected without a problem.

DISCUSSION ----------

We called Microsoft Tech Support and found that the same result is to be expected when printing from the Finder to an ImageWriter (or ImageWriter II) from any Macintosh under System 6 or 7.

The problem has been isolated and fixed in Excel version 3.0a. Registered users can call Microsoft Support for Excel on the Macintosh. Tell them that printing from the Finder to an ImageWriter causes problems, and they

will send the updated software.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

This article discusses system software and LaserWriter driver compatibility.

DISCUSSION -----

On the early Macintosh computers (128K and 512K), Apple Computer recommends using the LaserWriter driver 5.2 with System 3.2 and Finder 5.3. On later Macintosh computers, Apple recommends the combinations of system software and LaserWriter driver indicated in the table with YES. Items marked with an 'X' indicate that the combinations are compatible. However, you should use the recommended combinations.

Begin_Table

		System Software					
LW Driver	Driver Notes	Pre 6.0.7	6.0.7	6.0.8	7.0.x	7.1.x	7.5.x
6.0.2		YES	X	X			
7.1.x			YES	X			
7.2				YES	X	X	X
8.0						X	
8.1.x	1		X	YES	X	X	X

8.2	5				X	X	X
8.3.x	6,7				YES (3)	YES	YES
8.4	6,8				YES (3)	YES	YES
SW ------>							
NOTES ------>			10	2		4	

Notes	Description
1	The LaserWriter 8.1.2 driver was the last version of the LaserWriter 8.x driver tested with any version of System 6.x.
2	System 6.0.8 should use the LaserWriter 7.2 or 8.1.2 driver.
3	System 7.0.x should use the LaserWriter 8.3.4 or LaserWriter 8.4 driver WITHOUT the Desktop Printing extension.
4	Desktop Printing requires System 7.1 or greater.
5	LaserWriter 8.2 requires System 7.0 or greater.
6	LaserWriter 8.3 and greater with Desktop Printing requires System 7.1 or greater.
7	LaserWriter 8.3.4 can be found on Apple SW Updates and resolves the PCI Macintosh printing problem.
8	LaserWriter 8.4 is available on Apple SW Updates. It has many new features. If you have problems using the LaserWriter 8.4 driver, Apple Computer recommends using the LaserWriter 8.3.4 driver.
9	LaserWriter 7.2 seems to work properly on newer version of the Mac OS, such as System 7.5.3. Although Apple has not received reports of incompatibilities, LaserWriter 7.2 was not tested with recent versions of Mac OS.
10	Apple recommends that customers who want to continue using System 6.0.x, upgrade to System 6.0.8.

End_Table

Article Change History:
19 Aug 1996 - Updated with latest software revisions.
13 Apr 1995 - Added System 7.5 and LaserWriter 8.1.1, 8.2, and 8.2.2.
25 Jul 1994 - Corrected article name for system software matrix.

NetWare for Macintosh VAP 1.1: Phase 1/2 Conflict & Workaround

==========

Article Created: 23 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I have a 386 server running NetWare 2.15c and NetWare for Macintosh VAP v1.1 on an Ethernet network. The Ethercard in the file server is a Western Digital Star/Ethercard Plus (with AppleTalk) v3.07. There is also a Dayna AppleTalk PC card v1.22 to support a LaserWriter NT for the network. A Macintosh LC connects to the network with an Apple Ethernet card.

I have installed the VAP program three times and still can't get the LaserWriter or the file server to show up in the Macintosh Chooser. I'm running the driver for Phase II on the Macintosh LC.

I know that the Ethernet connection is good, because I also have Insignia Solutions SoftPC Universal v2.5 and SoftNode v1.0 running on the Macintosh LC. I can access the file server and run all the loaded applications (DOS and Netbios).

DISCUSSION -----

You most likely have an AppleTalk Phase 1 versus Phase 2 conflict. The NetWare for Macintosh VAP 1.1 only supports Phase 1. This prevents any Phase 2 client from using the services.

Novell recommended a workaround. Upgrade to NetWare 2.2, and to the Macintosh VAP version 2.2. This will provide the NetWare server with AppleTalk Phase 2, and allow it to publish a LaserWriter printer queue that Macintosh clients can use.

MacX: Problem with Ultrix Xlib Library

==========

Article Created: 24 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have a problem using MacX 1.1.7 and Ultrix dxcalendar. The DECwindow client Calendar on Ultrix hangs when using the client EDIT menu. The problem produces the error message:

```
  Xlib:  sequence lost (0x108b9 > 0x8ba) in reply type 0x1c!
```

This problem doesn't occur when using Calendar for the first time. Once I make a calendar entry, I see the problem. It works fine with White Pine's eXodus or with an NCD16 X Terminal.

Configuration:

- Macintosh IIci
- 8MB memory
- 13-inch Apple High Resolution RGB
- Built-in video card
- Ethernet Controller type 3Com Ethernet card, Revision L
- System software version 7.0
- MacX 1.1.7

DISCUSSION ----------

This is a known bug in the Ultrix version of the Xlib library which applications use to get access to the X protocol. It exists in Ultrix 4.0 and 4.1 and possibly later versions as well. This ISN'T a MacX bug; it happens under similar circumstances with Sun and other 68K-based X servers. MacX seems to have the problem more often than other servers due to the built-in conversion of the Clipboard to Macintosh Clipboard; this aggravates the problem.

PATHWORKS: Problem Escalation Process

==========

Article Created: 24 January 1992
Article Last Reviewed: 29 June 1992
Article Last Updated:

TOPIC ----------

I have a PATHWORKS question about problem escalation and the interface to Apple. Since DEC now owns all the code except DAL and MacX, should we just push all escalations up the "normal" DEC path?

DISCUSSION ----------

PATHWORKS for Macintosh has always been a Digital product. It's sold and supported by Digital. Report all problems with PATHWORKS-related components to Digital support.

- In the U.S., this is Digital Customer Support Center (CSC).

- From other countries, report problems to the local Digital office; they will escalate to Digital in the U.S. if necessary.

Apple Engineering has trained Digital engineering on the transitioned components. The process for escalation hasn't changed. If Digital CSC can't handle a problem, they will escalate it to the PCSG Engineering Maintenance Organization (PCSGEM). Should that component be something Apple developed and maintained, Digital PCSGEM will notify Apple Tech Comm.

Macintosh: DQDB (Distributed Queue Dual Bus) and MANs

Revised: 2/10/92
Security: Everyone

Macintosh: DQDB (Distributed Queue Dual Bus) and MANs

==========

Article Created: 21 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Is a card available for Macintosh computers to connect to Distributed Queue Dual Bus (DQDB) Metropolitan Area Networks (MANs)?

DISCUSSION ----------

A MAN data transport mechanism is the intended use of a Distributed Queue Dual Bus (DQDB), and DQDB MANs are meant to function as connectionless networks that link multi-megabit LANs together. Because of this, a Macintosh isn't a likely first candidate end-node device for design and manufacture of DQDB interface cards.

It's more likely that DQDB networks will connect to devices such as routers and bridges. Routers and bridges (interconnect devices) will be the first to have DQDB interfaces, and it may be a year or more before those come into real use. There have been some SMDS/DQDB trials, and Bell Atlantic is presently offering SMDS service to a limited area. Wide use of this technology is still several years away.

If you need to put your Macintosh computers on a MAN today, you can use a router to attach to the MAN and then a LAN (of your choice) to attach to the Macintosh end nodes. There may eventually be an SMDS/DQDB interface for the Macintosh when the service becomes a real commercial product.

Here's some background information on DQDB to help understand what it is.

DQDB Background Information

Metropolitan area networks (MANs) could offer answers to the demand for communications with anyone, anywhere, cheaply and reliably. The ideal

answer is a system that can support high speeds and geographical distances of hundreds of kilometers and be available for everyone.

FDDI is a popular backbone technology capable of high-speed communications and allows extended distances between networked sites. Presently FDDI is considered suitable for high-speed workstation networking.

The telephone industry supports a proposed MAN implementation called Queued Packet Synchronous eXchange (QPSX). The IEEE 802.6 committee changed the name to Distributed Queue Dual Bus (DQDB) in order to avoid confusion with an Australian company. MANs have implications that apply to corporate use and to the entertainment industry for advanced video and voice services.

The Distributed Queue Dual Bus (DQDB) standard was adopted as IEEE 802.6 in late 1990. DQDB describes a physical layer and Medium Access Control (MAC) sublayer to support packet and isochronous (time-sensitive) data transport over a metropolitan area. DQDB describes a transport network, not a MAN service.

Bellcore's description of a MAN service is SMDS. As currently specified, SMDS will provide the MAN service using DQDB as the underlying transport network. The first in a series of TAs defining the requirements for SMDS was released in October 1989. These documents include specifications for the user interface, service structures, network components, billing elements, and network management. SMDS TRs started to appear this year, and SMDS demonstrations, trials, industry groups, and related standards have also started to appear. SMDS will be very important in the RBOCs' future deployment plans for MANS, particularly as an initial step to offering Broadband ISDN (B-ISDN) services.

AT&T's competition comes from QPSX Systems of Perth, Australia, which backs Distributed Queue Dual Bus (DQDB). QPSX is a joint venture of Telecom Australia and the University of Western Australia, the developer of DQDB.

Communications industry analysts said there's little difference between AT&T's SMDS and QPSX Systems' DQDB beyond the initials. "SMDS is AT&T's implementation of DQDB," said Stuart Gavurin, a network analyst at Ernst & Young.

In 1987, IEEE decided to use DQDB as the basis for MANs, and a year later QPSX announced an agreement to allow AT&T to manufacture DQDB-compliant products. Shortly after that, however, AT&T decided to pursue its own implementation of MAN.

Gavurin said that the point for potential users to note is SMDS and DQDB adhere to the 802.6 standard and are compatible with each other. Users can buy products based on one implementation and know the products will work with those based on the other implementation.

Apple Ethernet NB Card: No Option to Disable Link Beat Signal

Revised: 2/21/92
Security: Everyone

Apple Ethernet NB Card: No Option to Disable Link Beat Signal

==========

Article Created: 23 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I want to install a new Apple NuBus Card, but I have two types of HP hubs. The newer one supports Link Beat and the old one requires Link Beat to be off.

If a hub requires Link Beat to be off, does the Apple NuBus card or software have a way to turn it off? I've heard of third-party cards that have jumpers on the cards to do this.

DISCUSSION ----------

The new Ethernet NB card doesn't have options to enable or disable the Link Beat signal. Some early twisted pair Ethernet hubs didn't use Link Beat and can't function with transceivers that use it. It's true that some third-party cards have the option to disable this signal. They're trying to be compatible with all hubs (pre- and post-10baseT). Apple designed the cards to be compatible with the true 10baseT specification, which requires Link Beat.

AppleTalk and IBM 8209 Bridges Don't Mix

Revised: 2/10/92
Security: Everyone

AppleTalk and IBM 8209 Bridges Don't Mix

==========

Article Created: 23 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I have a lab with 24 Macintosh LCs and one Macintosh IIci on Ethernet. The file server is attached to an IBM 8209 bridge which is a hardware component that bridges Token Ring networks and Ethernet networks. Some of the Macintosh LC computers randomly won't show the file server in the Chooser, but the Macintosh IIci always shows the file server.

If we restart the IBM 8209 bridge, the Macintosh LCs show the file server again. All the workstations, Macintosh LCs, and Macintosh IIci run system software version 6.0.7. The file server on the other side of the 8209 bridge is a Macintosh IIci running System 7.0 and AppleShare 3.0. We tried System 7.0 on all the computers, and AppleShare 2.0 with system software version 6.0.7 on the server.

DISCUSSION -----

Here is some information that should help you understand why the IBM 8209 bridge and AppleTalk aren't compatible.

IBM 8209 and AppleTalk

Ideally, with the 8209 providing Token Ring to Ethernet bridging services, Macintosh computers on both transports would see the bridged network as a single logical network. Unfortunately, for a number of reasons, this isn't true.

Phase 1 EtherTalk

The first problem stems from the 8209 bridge's generosity in forwarding all datalink (MAC) broadcasts and multicasts. When you run ANY Phase 1

EtherTalk, adding an 8209 bridge into the network automatically generates Phase 1 TokenTalk. This is useless traffic, because the TokenTalk drivers expect Phase 2 protocols. As far as we can tell, it isn't dangerous traffic; it's safely ignored by all nodes. But it does take up bandwidth, and if the Phase 1 Ethernet is large and has many routers, there can be significant broadcast traffic forwarded onto the Token Ring. The answer here is to filter Phase 1 EtherTalk at the 8209 bridge.

Address Bit-Flipping

Token Ring and Ethernet don't agree on the order of bits. So, the 8209 bridge flips the bits of the datalink (MAC) level addresses when it forwards the packets. Normally, this affects only the destination and source addresses in the packet header. However, address resolution protocols such as TCP/IP ARP and AppleTalk's AARP also carry MAC level addresses as a part of the data portion of the packet. The 8209 bridge is specially programmed to look for TCP's ARP, and to go down inside the data, flipping the bits of the embedded MAC address. Later, when a Token Ring host wants to talk with an Ethernet node, it uses the flipped version of the MAC address. When encountered by the 8209 bridge, the address is flipped back and thus delivered correctly.

The 8209 bridge ISN'T specially programmed to assist AARP. Thus, the AARP address is stored in the Token Ring AppleTalk node in its "unflipped" form. Then, should it be used later to address a packet, the 8209 bridge will flip the bits when forwarding back to Ethernet. Now the packet is incorrectly addressed, and can't be delivered.

In short, when using an IBM 8209 to bridge Token Ring and Ethernet, AppleTalk nodes on the ring and Ethernet can't communicate because they can never use AARP correctly.

Configuration Workarounds

Curiously, if the you use Token Ring only as a backbone, and a Macintosh on Ethernet wants to talk to a Macintosh on another Ethernet, with both Ethernets attached by 8209 bridges, this connection WILL work. In fact, as long as you go through an EVEN number of 8209 bridges, connection succeeds. When there's an odd number, connection fails. Note that this makes some extremely bizarre network configurations possible, such as a system of alternating Token Rings and Ethernets connected by 8209 bridges. In this case, all the Ethernets would have AppleTalk connectivity, and all the Token Rings would have AppleTalk connectivity, but the rings and Ethernets would have AppleTalk connectivity between them!

Address Ranges

You may remember that under AppleTalk Phase 2, we use multicast addressing for all protocol "overhead" packets, such as RTMPs, NBPs, and ZIPs. You may also recall that we have a range of 254 addresses used in Ethernet, and 19 different addresses in Token Ring available for multicasts.

Our use of different address ranges, in addition to the bit flipping

described previously, ensures that AppleTalk nodes can't interoperate across an 8209 bridging Ethernet and Token Ring. Just look at the startup process.

A node begins by sending an AARP probe for a protocol address (multicast). The 8209 bridge forwards this AARP message, but because the bits are flipped, a response to the AARP probe gets lost on the return trip. So, the node assumes that its protocol address is unique, and then proceeds to check for a router by multicasting (protocol broadcasting) a ZIP GetNetInfo request. If there is an AppleTalk router present on the cable (whether on Ethernet or Token Ring), it will work. The router hears the request, provides the needed information about the cable, and sends another AARP if necessary.

However, if the router is on the other side of the 8209 bridge, the multicast is forwarded. Even if the bit-flipping wasn't a problem (that is, if IBM were to change the 8209 software to support AARP), you will still NOT MAKE CONNECTION with the router. This is because a TokenTalk router expects multicast addresses in a different range than an EtherTalk node can send, and vice versa. The only answer is to use an AppleTalk router, which manages protocol and zone multicast addresses for each data link appropriately.

In short, AppleTalk and 8209 bridges don't mix. We advise you NOT to use bridging strategies between AppleTalk Token Ring and Ethernet networks.

10BASE-T: Specifications and Configurations

==========

Article Created: 24 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

We're configuring a large network and getting conflicting specifications regarding 10BASE-T hubs on Ethernet. We want to install the hubs on an existing thin backbone.

As an example, the Asanté hub has thick, thin, and 12 10BASE-T connections. We recommended hanging the hubs off the backbone via the thin connector and use all 12 RJ45s for computers. Asanté says we can't hang more than four or five hubs off a backbone, but Farallon says our configuration will work. Asanté recommends hanging the first hub off the backbone, and then daisy-chaining the rest using one of the RJ45s from each hub. Farallon says this isn't recommended.

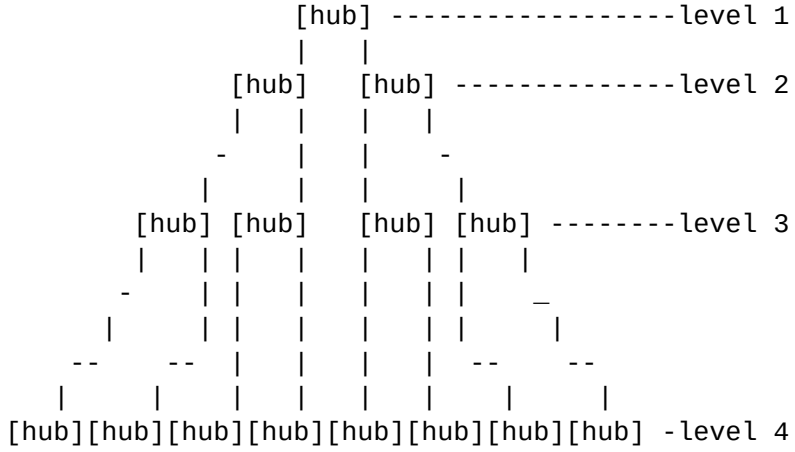
Can you give us some guidance regarding the specifications concerning 10BASE-T in this particular situation? This would help us configure future networks using UTP wiring.

DISCUSSION ----------

IEEE 802.3 Specifications

The IEEE 802.3 10baseT specification states that any two communicating stations can't be separated by more than five segments. This means that you can have up to four repeaters within any given communications path. When a transmission path consists of four repeaters and five segments, up to three of the segments may be coax and the remainder must be link segments. Link segments are defined as repeater-to-repeater links such as FOIL, 10BASE-T, 10BASE-FB, and 10BASE-FL This means each 10baseT port is treated as an inter-repeater link so you can cascade up to five concentrators together before you exceed the 802.3 specification. Some hub

manufacturers (SynOptics) push the limit past the 802.3 specification and allow up to four levels of cascaded hubs. The maximum transmission path between communicating devices is then seven.



Whether the cascaded hub configuration is a better design than the backbone depends on several factors.

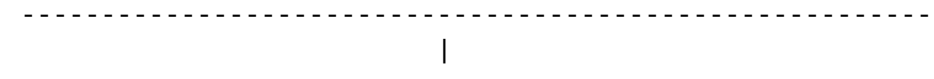
Using an Existing Backbone

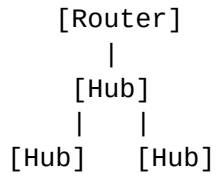
If there is an existing backbone, it might be more cost effective just to use it rather than to run new cable to support the cascaded configuration. The environment itself also plays a key role in network design. A 10BASE-T link supports distances of up to 100 meters (approximately 320 feet); a FOIL link supports distances up to 500 meters (in the maximum five segment network). These are both defined as link segments. Multiple devices can't share link segments in the way a backbone configuration would allow. Again, cost might play a key factor in choosing the right design. Running a shared backbone may be more cost effective, or it may be overkill. This is something that careful analysis of the physical location and intended network use will show.

Cascaded Network

Consider the situation where you would like to isolate the traffic from one hub. If you were to use a cascaded design, it might be more difficult to install a router or a bridge between hubs and still offer the partitioned hub reliable backbone service. The partitioned hub might be subject to additional down time in a cascaded design. If one of the hubs above it were to crash, it wouldn't be able to gain access to the backbone. If it were directly attached, it would always have reliable service no matter what other hub crashed. On the other hand, you might isolate your traffic better by putting a significant amount of your low to medium users on a big cascaded network and isolate them from the backbone with only a single router.

Backbone





The cascaded design may also offer some potential retransmission savings from the standpoint of fewer collisions, thus fewer retransmissions. In the cascaded design, the physical topology limits the number of devices on each hub-to-hub link to two (because they are "link" segments). With only two devices attached to a segment the number of collisions is greatly reduced, since only two devices are contending for the cable at any given time. If you attached each of the hubs to a single backbone, the overall throughput could be reduced (depending on the traffic patterns) because of the extra collisions and hence retransmission of data packets. Of course this will depend on predicted traffic patterns for each of the hubs.

Neither design is right or wrong; it really depends on usage requirements and budget.

Security: Everyone

Macintosh: RPC-Based Tools

==========

Article Created: 28 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

We developed an RPC implementation for OS/2, and would like the same functionality on the Macintosh. Is there an equivalent product for the Macintosh operating system?

DISCUSSION ----------

Netwise offers the only RPC-based tools we're aware of for the Macintosh operating system. Netwise has developed some RPC monitors and end-user applications based on RPC for the PC market, but it offers only a developers' toolkit for the Macintosh.

Also, IPT developed a peer-to-peer (Macintosh to Sun) network communications application that maintains the native user environments on both platforms.

Netwise RPC TOOL

The Netwise RPC TOOL for Macintosh computers on TCP/IP networks provides remote procedure call technology for Apple platforms. The RPC TOOL allows developers to build client/server applications for a wide variety of hardware, operating systems, and network transport environments. RPC TOOL for Macintosh supports Macintosh System 6.0 or later, and Symantec Corporation's C development environment, THINK C, version 4.0.

The Macintosh RPC TOOL allows Macintosh applications to interoperate across a TCP/IP network with applications running on diverse systems, including DEC VAX computers running VMS and ULTRIX, PCs running DOS and OS/2, Sun workstations, Unisys, Hewlett-Packard, and Data General hardware, and many other systems running UNIX variations.

Information Presentation Technologies Sun-Partner

Sun-Partner symmetrically maps network protocols and operating system commands between graphical user interfaces. Sun SPARCstations look like Macintosh computers to Macintosh users, and Macintosh computers look like Sun workstations in the OpenLook or SunView environments. Users can share and exchange data from their own user interfaces. All networked devices are available simultaneously to Sun and Macintosh users.

Sun-Partner supports LocalTalk, EtherTalk Phases 1 and 2, AppleTalk Filing Protocols, and the Apple Data Stream Protocol (ADSP) for Macintosh computers and TCP/IP ARP, RARP, and NFS protocols for Sun SPARCstations.

Each SPARCstation on a SunPartner LAN must have version 4.1 or later of Sun's operating system and an Ethernet-to-LocalTalk connection to run on Ethernet, or an sBus LocalTalk card from IPT to run on LocalTalk. An optional sBus LocalTalk card is available. Without Macintosh System 7.0, each Macintosh on a Sun-Partner network requires IPT's Personal Server Network (PSN) software. A Sun and a Macintosh connection are required for bidirectional networking.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

A/UX: Glossary of Terms (8/94)

==========

Article Created: 14 January 1992
Article Reviewed/Updated: 30 August 1994

TOPIC ----------

This document contains an edited version of the September 1989 A/UX Glossary.

DISCUSSION ----------

/usr/group. An organization of UNIX users.

/usr/tmp. The /usr subdirectory that serves as storage for temporary files that many utilities produce.

AIX. Advanced Interactive Executive; IBM's UNIX operating system.

Archer Group. The former name of UNIX International (AT&T-aligned companies).

autoconfiguration. A/UX capability to automatically configure the smallest possible kernel by checking for installed NuBus cards.

autorecovery. A/UX capability to reinstall critical system files from duplicate copies on disk. in the event of a system corruption. This is unique to Apple.

B-Net. UNISOFT's port of Berkeley Networking Services; BSD software to provide TCP/IP communication.

background processing. The ability to run programs in the background (behind the scenes) while freeing the display screen for other tasks.

Berkeley Networking Services. B-Net; a utility to provide TCP/IP communication.

binary file. Any executable file.

Bourne shell. The command shell that Steven Bourne developed at AT&T.

BSD. Berkeley Software Distribution, the University of California (Berkeley) version of UNIX. The most common versions are 4.2 and 4.3.

C. A high-level language with few hardware dependencies; the UNIX operating system is written in C.

C Shell. The command interpreter developed by U.C. Berkeley programmers

CASE. Computer-aided software engineering.

commands. See Utilities or command name

DECWindows. DEC's proprietary windowing system; the programming interface for DECwindows is incorporated in OSF's standard windowing system. It is based on X Window System from MIT.

directory. A collection of subdirectories and files; a Macintosh folder.

Federal Information Processing. The U.S. federal government's standard for computer purchases; FIPS 151 is based on IEEE's POSIX 1003.1 standard (currently based on Draft 12, Standard (FIPS) of POSIX 1003.1).

FIPS. See Federal Information Processing Standard.

GOSIP. The U.S. federal government's version of the OSI standard.

HFX. Hierarchical File Exchange; a file-translation utility to transport files between A/UX and Macintosh file systems, so users can work in either environment and transfer information

IEEE. See Institute of Electrical and Electronic Engineers

IEEE POSIX 1003. IEEE's standard for development of vendor-independent applications.

Inside Macintosh. A series of Apple documents that define standards for Macintosh application programming.

Institute of Electrical and Electronic Engineers. The organization that (among other things) creates POSIX standards.

kernel. That portion of the operating system that communicates directly with the hardware to allocate software and hardware resources.

korn shell. A revised command interface that contains features of its two predecessors, the Bourne and C shells for AT&T and Berkeley, respectively

man page. A reference manual page, available on-line with most UNIX systems.

MOTIF. OSF's windowing system. A hybrid of Microsoft's Presentation Manager, HP's New Wave, and DECwindows; It is built on the X Window System from MIT.

multitasking. The ability of a CPU to perform multiple tasks simultaneously by rapidly switching among them.

multiuser. The capability that lets more than one user at a time use the computer.

netnews. The global UNIX user bulletin board with over 500 interest groups and over 8000 recipient systems. It also includes an electronic forum for stating opinions, sharing ideas, requesting, receiving, and providing information, and posting public-domain software

Network File System (NFS). The defacto standard from Sun Microsystems for transparent file sharing. This facility enables a user on one vendor's computer to access files on another vendor's computer.

New Wave. The HP windowing system. Portions of New Wave are incorporated in OSF's standard windowing system

NFS. See Network File System

Open Software Foundation (OSF). A standard-development consortium of companies including DEC, Hewlett-Packard (Apollo), and IBM. It grew out of the so-called "Hamilton Group."

OSF1. OSF's UNIX operating system, based on IBM's AIX operating system

operating system. Software that manages a system's resources -- such as CPU, memory, I/O, disk storage, and networks.

OSF. See Open Software Foundation

OSI. A networking standard. OSI is an emerging set of communications protocols (an alternative to TCP/IP) primarily of interest to Europe and the U.S. Federal Government.

pipe. A feature of UNIX command shells that lets tools (known as filters) to be chained together to create new utilities. Piping causes the output of the first command to become the input of the second.

portability. The ability of software to move from one environment with a particular computer and operating system to another environment; transferability from one computer to another. There are two kinds: Source-level portability requires recompilation. Object-level portability requires only moving the file to the new machine.

POSIX. A set of standards formulated by IEEE as guidelines to allow for development of vendor-independent applications. POSIX 1003.1 defines the UNIX-based operating system interface standard.

Presentation Manager. Microsoft's windowing system. Its human interface constructs have been incorporated in OSF's MOTIF standard windowing system.

SASH. Stand Alone Shell of A/UX; A Macintosh application that shuts down the Macintosh OS to start A/UX. It also allows limited access to A/UX files without starting A/UX.

SCCS. See Source Code Control System.

Serial Line/Internet Protocol (SL/IP). A communications protocol that provides features of TCP/IP over slower, longer distance serial lines. Capabilities like NFS and Telnet Virtual Terminal are available over SL/IP.

shell. A specialized UNIX utility that serves as a character oriented, command-line user interface. C, Bourne, and Korn are three shells available with A/UX.

shellscript. A file containing a list of commands to be executed sequentially; a batch file.

Single-tasking. Allowing only one operation at a time. Contrast with multitasking.

single-user. Allowing only one person at a time to use the computer. Contrast with multiuser.

SL/IP. See Serial Line/Internet Protocol

Source Code Control System (SCCS). A utility developed to control versions of software source code, so they can be safely accessed by multiple programmers and writers on a large project.

superuser. System administrator on a UNIX system who has special privileges like changing file permissions, reassigning its ownership, or deleting.

SVID. See System V Interface Definition

SVVS. See System V Verification Suites

System V Interface Definition (SVID). The AT&T standard that defines core elements of the System V operating system. SVID-1 describes AT&T V.2, and SVID-2 describes AT&T V.3.

System V Verification Suites (SVVS). AT&T software that runs on a UNIX system to test whether that system meets the SVID. SVVS 1 and 2 correspond to and test for compliance with SVID 1 and 2 and V.2 and V.3, respectively.

TCP/IP. See Transmission Control Protocol/Internet Protocol.

Transfer Control Protocol/Internet Protocol (TCP/IP). A communications protocol and defacto standard protocol for Ethernet networks used by most UNIX environments. TCP/IP is typically the underlying protocol with NFS, Telnet, and X Window System.

Trusted systems. The U.S. federal government's graded approach to security standards. Also known as "Orange Book." It defines a series of levels of Trust. C1 to A1 where C2 will be the basic requirement for government security in the near future, B1 is a greater level of security and is expected to be the level typically requested for secure government bids.

UI. See UNIX International.

UNIX International (UI). A consortium of companies that follow the AT&T standard for UNIX systems. Originally created to counteract OSF's efforts (previously called Archer group)

usenet. Global Unix mail service sponsored by various universities and large corporations. It tends to be the primary method for UNIX users to share information.

utility. A program that does most operating services, like listing, copying, renaming, and removing files.

uucp. The UNIX to UNIX Copy command is a utility that enables file transfers between UNIX systems and allows automatic transmission of mail messages.

X Window System Consortium. A group originated by MIT that defines X Window System standards for future versions. Apple is a member.

X Window System. A device-independent multitasking environment, originally designed by MIT, for windowing and graphics. It operates across heterogeneous networks.

X/OPEN Standards Committee. A group begun in Europe that sets standards for UNIX and related tools. It focuses primarily on user needs and includes UI and OSF in its membership.

Yellow Pages. A distributed network database service that makes available to workstations copies of files maintained on the server. Usually used in conjunction with NFS. Licensed and developed by Sun Microsystems

MacX 1.1: Using with System 7.0.x (6/94)

Revised: 6/15/94
Security: Everyone

MacX 1.1: Using with System 7.0.x (6/94)

==========

Article Created: 14 January 1992
Article Reviewed/Updated: 15 June 1994

TOPIC ----------

Can I run MacX 1.1 under the Macintosh System Software 7.0.x?

DISCUSSION ----------

MacX 1.1 is designed for use with Macintosh System software version 6.0.x. You can also use MacX 1.1 with System 7.0.x with limitations, by following the steps in this document. (You do not need to perform these procedures if you want to use MacX 1.1 on System software version 6.0.x.)

IMPORTANT: MacX version 1.1.7 is compatible with System 7.0.x, and MacX version 1.2 is compatible with System 7.1.x. It is recommended to upgrade MacX.

If you're using MacTCP to connect your Macintosh computer to a host computer, you can use MacX 1.1 with System 7.0.x by following several setup procedures. These procedures describe several guidelines that let you use MacTCP version 1.0.2 with System 7.0.x.

Note: If you're using a connection tool other than MacTCP, the instructions in this document don't apply. For more information, contact the vendor of your connection tool.

To use MacX 1.1 with System 7.0.x, install MacX 1.1 and MacTCP 1.0.2 on your computer and then follow the instructions below.

1) Don't use Virtual Memory under System 7.0.x. Open the Memory Control Panel and make sure Virtual Memory is turned off.

2) Connect via Ethernet with MacTCP. For Token Ring access you must use MacTCP 1.1 or later with the MacTCP Token Ring extension.

3) Open the MacTCP control panel to make sure that the Ethernet icon is

present and selected. (You cannot use a DDP/IP gateway via EtherTalk, LocalTalk, or TokenTalk.)

4) Make sure the MacTCP control panel, the AdminTCP control panel, and the Hosts files are in your System Folder and NOT in the Control Panels folder.

   To copy these files to your System Folder, drag the icons for the three files to the open System Folder window. Do not drag the icons to the System Folder icon; the Finder will put them in the wrong place.

5) Restart your Macintosh computer to put these changes into effect.

You are now ready to use MacX 1.1 on your Macintosh computer running System 7.0.x. You may want to store this document in your MacX binder for quick reference.

Note: MacTCP 1.0.2 is not fully compatible with System 7.0.x. Apple Computer, Inc. does not therefore guarantee 100 percent compatibility and functionality.

Article Change History:
15 Jun 1994 - Included the MacTCP Token Ring extension and MacX 1.2.

MacX 1.1.7: Needed for System 7, Not for A/UX

==========

Article Created: 14 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I use both System 7 and A/UX. Do I need to update to MacX 1.1.7?

DISCUSSION ----------

If you are running MacX with A/UX, you do not need to upgrade to MacX 1.1.7. MacX has been included in A/UX since version 2.0.1 (March 1991). The next version of A/UX, which will include support for System 7, will incorporate MacX 1.1.7.

MacX 1.1.7 is the latest version of Apple's X Window System display server for the Macintosh operating system. It provides X Window System access and functionality for Macintosh computers in multivendor environments. MacX 1.1.7 provides an integrated computing environment with simultaneous access to Macintosh and X applications and the ability to cut and paste color graphics and text between them.

MacX 1.1.7 provides support for System 7. MacX users can take advantage of System 7 functionality, like Virtual Memory. This new capability expands the computer's memory through software, so that Macintosh users can run more and larger applications. MacX 1.1.7 is required for running MacX with System 7.

In addition, X11 for A/UX, Apple's complete X development environment replaces X Window System for A/UX, which used to incorporate MacX. You can use this product, which includes client applications, libraries, and tools for X Window System development. X11 for A/UX includes the software on both floppy disks and CD-ROM discs.

MacX25 1.0.1: Overview

==========

Article Created: 14 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What is the latest version of MacX25, and what are its features?

DISCUSSION ----------

MacX25 version 1.0.1 is updated software for linking Macintosh computers to packet-switched data networks (PSDN) supporting the international OSI and CCITT X.25 recommendation for enterprise-wide communication.

Apple's MacX25 1.0.1 runs on Macintosh computers running System 6 or System 7, supporting any Macintosh as an X.25 client and all Macintosh II computers as servers. System 7 offers a range of services for networking, including file sharing and interapplication communication. To ease your transition to using X.25 in the newer system software environment, MacX25 version 1.0.1 retains the same set-up configuration and does not alter the interface used in MacX25 version 1.0. Access to host computers and end-user services on the PSDN is distributed from a MacX25 server to Macintosh computers over the AppleTalk network system.

For improved communication with European networks, MacPAD (the client side of MacX25) now supports 8-bit characters. Support for 8-bit characters -- in which such symbols as the German umlaut, French cedilla, and Spanish tilde are encoded -- enables businesses on both sides of the Atlantic to transfer data files transparently and to communicate in the appropriate European languages.

The new MacPAD also offers new features for flexibility in communicating across the X.25 network, including the ability to negotiate throughput parameters and the size of packet windows. In addition, because it is implemented as a connection tool for the Communications Toolbox, MacPAD

lets third-party applications, including terminal emulators, connect to host systems over the X.25 networks.

The MacX25 Programming Library, available separately for third-party developers, works in conjunction with the MacX25 server to provide X.25 access to applications. This enables developers to create Macintosh solutions giving users access to PSDNs. The library, which remains unchanged in the new version of MacX25, consists of a toolkit for such routines as initiating and terminating contact with the MacX25 server, establishing and closing down a virtual circuit, and passing data across an established circuit.

For example, an application developed in Italy uses tools in the MacX25 Programming Library to provide Macintosh-to-host access across an X.25 network. List SpA developed a cost-effective interbank trading network for the Italian banking system that enables Macintosh computers in each bank to connect to the system's mainframe over the X.25 network.

Apple's MacX25 conforms to the Open Systems Interconnect (OSI) model and Consultative Committee on International Telephone and Telegraph's (CCITT) X.25 recommendation for communication with packet-switched data networks (PSDN). Because of their cost-effective use of leased lines to transmit information over long distances, X.25 PSDNs offer an increasingly popular means for electronic communication internationally.

MacX25 consists of server and client software. The MacX25 server software lets a Macintosh on an AppleTalk network be set up as a single entry point to the PSDN. Server-based access reduces the cost of global connectivity by maximizing use of expensive resources, like leased lines. MacPAD client software works in conjunction with the server software to provide packet assembler/disassembler connectivity to the PSDN.

MacX25 features a graphics-based administrator's application that facilitates configuration and administration of the server. An address service lets administrators set addressing details on the Macintosh server.

Running the server component of MacX25 1.0.1 under System 7 requires 4MB of RAM; the client side needs 2MB. To run MacX25 1.0.1 server software with System 6.0.7 requires 2MB of RAM; the client side needs 1MB.

MacX25 supports the following standards and recommendations: CCITT X.25 1980 and 1984 versions and Packet Assembler/Disassembler (CCITT X.3, X.28 and X.29).

TOPIC ----------

Who would purchase X window system for A/UX?

DISCUSSION ----------

People who want to run the X11 native environment on a Macintosh or need to develop X Window System applications should use X Window System for A/UX. It includes X11 Release 4 with libraries, toolkits, and clients for development.

If you need access to X Window System applications, you do not need to purchase X Window System for A/UX. A/UX 3.0 includes MacX and the X Window System display server software.

A/UX 2.0.1: Compatibility with Macintosh Applications

==========

Article Created: 15 January 1992
Article Last Reviewed: 31 August 1992
Article Last Updated: 31 August 1992

TOPIC ----------

Which Macintosh applications run on A/UX?

DISCUSSION ----------

With A/UX, users have access to the wide range of Macintosh applications available at local dealers -- the same application binaries that run on the Macintosh OS. There is only one restriction: Applications must follow the "Inside Macintosh" development guidelines for 32-bit cleanliness.

This is also a requirement for applications that run with virtual memory on Macintosh System 7. All key industry software developers are moving in this direction. Many already offer mainstream applications which are 32-bit clean and thus run on A/UX 2.0.1. This group includes Microsoft, Claris, Aldus, and Informix. A complete list of applications is included in the A/UX Third Party List on AppleLink under the A/UX icon.

As a transitional step, A/UX 2.0.1 also includes a 24-bit environment which allows users to run many applications which are not yet 32-bit clean.

All applications that run on A/UX 2.0 also run on A/UX 2.0.1. The applications categories include Macintosh, UNIX, X Window System, Motif (from Integrated Computer Solutions) and MS-DOS applications (using SoftPC from Insignia Solutions).

TOPIC ----------

Which UNIX applications run on A/UX?

DISCUSSION ----------

The UNIX application community has expressed a lot of interest in porting UNIX and X Window System applications to A/UX and for new development work. A good example is Oracle; they have ported their UNIX database to A/UX and have provided Macintosh tools to access this data easily.

Many UNIX development tools have also been ported to A/UX. Refer to the Redgate Library on AppleLink for a list of compatible third party products. In addition, many of our largest A/UX customers are asking these application developers to support A/UX.

AppleTalk Remote Access: AppleEvents Support

Revised: 2/11/92
Security: Everyone

AppleTalk Remote Access: AppleEvents Support

==========

Article Created: 28 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

What AppleEvents does the Remote Access application support? I'm looking for a capability to request a connect and/or disconnect from the AppleTalk Remote Access application via AppleEvents.

DISCUSSION -----

Remote Access supports only the AppleEvents from the required suite:

- Open Application
- Open Document
- Quit Application

It doesn't support Print Document because AppleTalk Remote Access doesn't have a print option.

After installing AppleTalk Remote Access, if you launch Remote Access without configuring Remote Access Setup, a dialog box appears asking if you would like to do so. At that point, AppleTalk Remote Access sends the Finder an "Open" Remote Access Setup AppleEvent.

As an alternative, you may want to use the AppleTalk Remote Access Application Programming Interface (API). It would be possible to have your application access the API directly, or to have your application send an AppleEvent to a program that accesses the API directly.

Details of the API external reference specifications are available from APDA in the AppleTalk Remote Access Developer's Toolkit. Part number R0128LL/A.

Macintosh 21" Color Display: Disabling Automatic Degauss Feature

==========

Article Created: 27 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What is the purpose of the Macintosh 21" Color Display automatic degauss feature, and can it be disabled?

DISCUSSION ----------

All color monitors can lose purity (manifested as faint blotches of color on the display) when the monitor is moved to a different location, turned on its base, or influenced by an external magnetic field. In the past, the only methods for correcting this problem were either to switch off the monitor and then switch it back on, or to enable the degauss switch. When you switch on the monitor, the monitor degauss circuit operates for a fraction of a second to restore screen purity.

The Macintosh 21" Color Display does this automatically. When any of the aforementioned conditions occurs, the monitor emits an audible beep and degausses itself. The entire process takes less than a second. However, some locations where computers are used may be exposed to intermittent external magnetic fields, which can trigger the display's automatic degauss circuit and may be annoying to the user.

This feature can be safely disabled by disconnecting connector X911, mounted on the Position Sensor Board. The Position Sensor Board is located above the CRT neck and just behind the deflection yoke.

Once the connector is disconnected, the only way to degauss the monitor is by pressing the degauss switch at the back of the monitor.

Note

..TIL09737-Macintosh_21_Color_Display-Disabling_Automatic_Degauss_Feature.pdf

Disabling the automatic degauss feature may cause the display to exhibit a tilting or leaning affect. This is because the position sensor is also used to compensate for stray magnetic fields, which may cause raster tilting.

Mac Video Cards: Older Versions Compatible With Mac II Series

==========

Article Created: 27 January 1992
Article Last Reviewed: 15 June 1992
Article Last Updated: 15 June 1992

TOPIC ----------

Are the older versions of the Macintosh video cards compatible with all Macintosh II series computers?

DISCUSSION ----------

Yes. The older 4-bit and 8-bit Macintosh video cards (661-0376 and 661- 0492, respectively) are compatible with all Macintosh II series computers, including the Macintosh IIfx. They're also compatible with the Macintosh Quadra computers.

Here's some additional information that might be useful. The older style video cards do not have sense line capabilities. This means that, when more than one older type video card is installed, the Macintosh will start up to the card nearest the power supply NuBus slot. Or, when older type video cards are used in combination with later version video cards, the Macintosh will always start up to the older version video card, regardless of NuBus slot positioning.

The older style video card takes precedence because of its lack of sense line capability.

Service Source CD-ROM: DART 1.4 May Give Erroneous Virus Warning

==========

Article Created: 28 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

When I try to run DART from my Service Source CD, I get a warning message that the DART program is infected with a virus and I should quit the program as soon as possible and load new software from backups.

Is the Service Source CD infected with a virus?

DISCUSSION ----------

The Service Source CD does not have a virus on it. The DART application on the CD is an older version (1.4). When DART 1.4 is launched on some systems (Macintosh IIfx and Macintosh Quadra series) running system software version 7.0.1, it presents a dialog box stating that there is a virus. This seems to be a problem with DART 1.4.

The latest version of DART (1.5) does not exhibit this problem. The Service Source group is aware of the problem and will be removing the DART application from future releases of the Service Source CD.

LaserWriter: Using in a Classified Environment

Revised: 8/26/92
Security: Everyone

LaserWriter: Using in a Classified Environment

==========

Article Created: 27 January 1992

Article Change History

08/25/92 - REVIEWED
- For technical accuracy.

TOPIC ----------

I use my LaserWriter II in a classified environment. Does the LaserWriter II contain any non-volatile RAM that can be used to store classified information?

DISCUSSION ----------

It would be very difficult to store a user program or data in the LaserWriter printer's EEROM or ZPRAM. The only documented way to write information to non-volatile memory is to use the PostScript operators as defined in the "PostScript Language Reference Manual". There is a way to write directly to non-volatile memory, but Adobe does not make this information available to the public.

Here's a list of LaserWriter printers and the amounts and locations of non-volatile memory:

Printer	Amount & Location of Non-Volatile Memory
LaserWriter	512 bytes of EEROM
LaserWriter Plus	512 bytes of EEROM
LaserWriter IISC	none
LaserWriter IINT	512 bytes of EEROM
LaserWriter IINTX	2048 bytes of ZPRAM

LaserWriter IIf	8192 bytes of EEROM
LaserWriter IIg	8192 bytes of EEROM
Personal LaserWriter LS	none
Personal LaserWriter SC	none
Personal LaserWriter NT	2048 bytes of EEROM

The EEROM and ZPRAM components are soldered into place and cannot be removed easily for servicing. There is no way to erase the non-volatile memory via PostScript.

Most sites operating in a classified environment have a designated security officer who is responsible for ensuring that no equipment with non-volatile RAM or other storage capabilities is released from the classified area. Providing the EEROM and ZPRAM information listed above should be sufficient for the security officer to determine whether the board can be released from a classified environment.

Article Last Updated: 14 July 1992

TOPIC ----------

What is the key combination to change the desktop color of my Macintosh?

DISCUSSION ----------

There is no Apple-provided key combination that changes the color of your Macintosh desktop. If you've seen someone change the desktop color this way, it was most likely with a product that was used to automate the process of using a control panel to change the desktop color. Look for third party macro programs like QuicKeys which may be able to accomplish this for you.

For more information, search on "CE Software" and "3rd".

PowerBook Modem: Some AT Command Usage Differences From Hayes

Revised: 5/17/94
Security: Everyone

PowerBook Modem: Some AT Command Usage Differences From Hayes

==========

Article Created: 23 January 1992
Article Reviewed/Updated: 31 July 1992

TOPIC ----------

I have noted a problem with the Macintosh PowerBook Fax/Data Modem. It appears to get confused and is unable to take a phone line "Off Hook" when a program tries to place a call. All I hear is a clicking sound.

DISCUSSION ----------

The PowerBook Fax/Data Modem is mostly Hayes compatible; however, there are some differences with AT command usage. One command that was changed is the escape sequence. To take it "Off Hook", use +++AT<cr> without any wait delay. This is documented in the Macintosh PowerBook manual.

LaserWriter IIg: How Printer Handles Three Communication Ports

Revised: 2/14/92
Security: Everyone

LaserWriter IIg: How Printer Handles Three Communication Ports

==========

Article Created: 28 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

How does the Apple LaserWriter IIg handle print jobs among the three communication ports?

DISCUSSION ----------

The LaserWriter IIg has three communication ports that can be active simultaneously. Special arbitration logic controls the activity between the three ports. The port arbitration has nothing to do with the LocalTalk or EtherTalk PAP layer connection arbitration.

Because PostScript can process only one job at a time, only one port can have access to the printer at any given time. The ports are polled in a round-robin fashion until activity is sensed in one of the three ports. Polling is then terminated as a connection is established and execution of a job begins. A connection, in this sense, refers to the dedication of the printer to a communication port while PostScript jobs are received from a host. AppleTalk ports may process multiple jobs during a single connection while the other serial port connections consist of only one job. A non-AppleTalk connection is considered terminated when an EOF (end-of-file indicated end-of-job) character is received.

The port arbitration cycle begins whenever a connection is terminated by a host. The polling order is determined by starting with whichever port has gone unpolled for the longest period of time. The port waiting the next longest is the next to be polled, with the last active port being the last to be polled again. This procedure ensures that one port will not dominate the printer. If a port is opened directly by an active PostScript job, that port is excluded from arbitration until it is again closed. An example of this type of port activity is when a serially connected sheet feeder is

opened by a PostScript job.

All three ports respond to status request, with current printer status, unless they are excluded from the port arbitration cycle due to being opened directly by a PostScript job or just configured inactive. Directly opened ports may either respond with stale status or not respond at all. Ports that are not arbitrated due to configuration may not respond or even appear on the network.

Polling an AppleTalk Port

Printer	AppleTalk Port Driver
inquire->	Any Open Conn on this port since last inquire or last closed connect (which ever occurred last)? YES = True NO = False
If True->	GetNextjob - uses PAP connect arbitration to get oldest of valid OpenConn request for this port.* If no OpenConn is received by 5 second time-out, GetNextJob cancelled and port arbitration cycle resumed. If OpenConn is received in time, connection established and PostScript job is read and executed. At end of job, close connection and resume port arbitration cycle.
If False->	Poll next port

*GetNextJob is active on only one AppleTalk port at a time and never for more than 5 second timeout.

Polling a Serial Port

inquire->	Any characters received on this port since last inquire or last EOF (whichever occurred last?) Yes = True No = False
If True->	Open connection established and PostScript job is read and executed from that port. At end of job, close connection and resume port arbitration cycle.
If False->	poll next port

Macintosh: Correcting ID -127 Internal File System Error

==========

Article Created: 10 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have a Macintosh II running system software version 6.0.5 and AppleShare 2.0.1 as a network server.

Using the AppleShare Admin program, I tried to change a group of nested folders from locked to unlocked. When I clicked the Locked box and selected the Change All Enclosed Folders option, I got error ID -127. I don't get this error message if I unlocked the folders individually.

DISCUSSION ----------

Error ID -127 is an internal file system error. You may have a damaged directory tree.

Here are some corrective measures to try:

- Start up the Macintosh from the System Tools Disk and run Disk First Aid to repair any minor damage.

- Rebuild the desktop. To rebuild the desktop, press and hold the Option and Command keys while starting up the Macintosh until you see the message asking whether you want to rebuild the desktop.

- Reinstall the system software and the AppleShare software.

Macintosh: Spacing and Font Substitution

Revised: 7/21/92
Security: Everyone

Macintosh: Spacing and Font Substitution

==========

Article Created: 29 January 1992
Article Last Reviewed: 8 June 1992
Article Last Updated:

TOPIC -----

I'm using system software version 6.0.7 and printing text in Geneva. Instead of getting the bitmapped font, I want to substitute it for Helvetica. I checked the Font Substitution box in Page Setup…, but the printout isn't exactly the same size and spacing as the one printed in Helvetica. Shouldn't it be the same in both Helvetica and Geneva?

DISCUSSION -----

When using font substitution (in this case substituting Helvetica for Geneva), the font used in place of Geneva (Helvetica) will use the Geneva spacing, not the Helvetica spacing. The point size, however, should be the same (that is, Geneva 12 point will substitute Helvetica 12 point). Only the spacing will be different.

Two versions of the same document (one using Geneva on screen and one using Helvetica on screen) would look different when printed, even though you print both documents in the same font (Helvetica).

OneScanner: Not Recognized at Startup (2/95)

Revised: 2/27/95
Security: Everyone

OneScanner: Not Recognized at Startup (2/95)

==========

Article Created: 29 January 1992
Article Reviewed/Updated: 27 February 1995

TOPIC ----------

I've had an ongoing problem with a Macintosh Quadra 700 and the Apple OneScanner. The OneScanner worked once, then failed. I checked the Macintosh Quadra for proper drive termination, and reseated/replaced the SCSI cable.

I've used both gray and black terminators on the scanner, no terminators, terminators on both ports, and replaced the scanner cable. The order in which I turn devices on doesn't seem to matter. I can't get any configuration to work consistently. What do you suggest?

DISCUSSION ----------

All Apple OneScanners with ROM version 2.02 could have a SCSI ID recognition problem when connected to any Macintosh Quadra or Power Macintosh computer. The Apple OneScanner is not recognized on the SCSI bus if the OneScanner is powered on before the Macintosh.

There is a workaround to this recognition problem:

Using the OneScanner with a Quadra or Power Macintosh
---

1) Power on the Macintosh, and let it start up to the Finder.

2) Power on the Apple OneScanner.

The OneScanner has, approximately, a 12 to 13 second power-on sequence. This power-on sequence consists of a variety of audible motor calibrations. The sequence is complete when you hear the last sound -- about 12 seconds after switching on the power.

Using the OneScanner With a Quadra Running A/UX
---

1) Power on the Apple OneScanner.

The OneScanner has, approximately, a 12 to 13 second power-on sequence. This power-on sequence consists of a variety of audible motor calibrations. The sequence is complete when you hear the last sound -- about 12 seconds after switching on the power.

2) Power on the Quadra.

3) Start up A/UX, and wait for the Log-in screen. DO NOT log in.

4) Turn off the Apple OneScanner, wait a few seconds, and turn the Apple OneScanner back on.

5) Log in to A/UX.

The Apple OneScanner should be recognized now. If not, try the process again.

Notes

• Use the standard gray terminator with the OneScanner and the Quadra or Power Macintosh.

• Apple has tested these workarounds, and they seem to work in most instances. However, Apple makes no guarantee that these workarounds are successful 100% of the time.

• This Apple OneScanner recognition problem applies only to the Macintosh Quadra and Power Macintosh series. No other Macintosh models are affected.

• The Apple OneScanner ROM version 2.03 corrects the recognition problem, and Apple Service inventory consists of the upgraded boards.

If you are unsure which ROM revision your Apple OneScanner (or any other SCSI device) has, connect the SCSI device to a Macintosh computer and launch a product called SCSI Probe 3.4 or later. SCSI Probe provides the SCSI ID, device type, vendor info, product name, and version information.

• Apple OneScanner owners with Macintosh Quadra computers who want to upgrade to ROM version 2.03, instead of using the workaround, should contact their authorized service providers for a replacement board.

QuickTime: Guidelines for Using Compressors

Revised: 3/4/92
Security: Everyone

QuickTime: Guidelines for Using Compressors

==========

Article Created: 8 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

We are a little confused about compression alternatives, and uncertain about how we might accelerate compression. When does JPEG make sense?

DISCUSSION -----

Below is a section from the QuickTime Developer's Guide that is included on the QuickTime 1.0 Developer's CD. It gives specific information about each of the compressors that Apple has included in QuickTime, including guidelines on when each should be used.

Photo Compressor

The photo compressor implements the Joint Photographic Experts Group (JPEG) algorithm for image compression. JPEG is an international standard for compressing still images. The version of JPEG supplied with QuickTime complies with the baseline International Standards Organization (ISO) standard bitstream, version 9R9. This algorithm is best suited for use with still images.

The photo compressor performs best on images that vary smoothly or that do not have a large percentage of their areas devoted to edges or other types of sharp detail. This is the case for most natural images. In practice, you will find that compression ratios are highly dependent on source images, but they generally range from 5:1 to 50:1 at 24 bits-per-pixel, with good picture quality resulting from compression ratios between 10:1 and 20:1.

Picture quality is generally very good to exceptional and is often good enough for use in demanding desktop publishing applications. Very high-

resolution images obtained through the use of 24-bit color scanners would best be compressed using the photo compressor.

On a Macintosh IIsi using a compression ratio of 10:1, the photo compressor can compress a 24-bit 640-by-480 pixel image at a normal quality setting in 7.5 seconds. Decompressing the same image takes 7 seconds.

Video Compressor

The video compressor employs an image-compression method developed by Apple. This method was designed to permit very fast decompression times while maintaining reasonably good picture quality. This algorithm's rapid decompression allows applications to display 24-bit images at interactive speeds. This algorithm is best suited for use with sequences of video data.

The video compressor is best suited to digitized video content rather than synthetically generated images. This compressor supports both spatial and temporal compression. If you use only spatial compression, you obtain compression ratios from 5:1 to 8:1 with reasonably good quality at 24-bit pixel depths. If you use both spatial and temporal compression, the compression ratio range extends from between 5:1 to 25:1.

The video compressor can be used for computer animation as well as digitized video, but you obtain higher image quality using the animation compressor. Similarly, the animation compressor can be used for digitized video as well as animation, though you obtain higher compression ratios from the video compressor.

On a Macintosh IIsi using a compression ratio of 6.5:1, the video compressor can compress a 24-bit 640-by-480 pixel image at a normal quality setting in 3.5 seconds. Decompressing the same image takes 1.0 second.

Animation Compressor

The animation compressor employs a compression algorithm developed by Apple. This technique is best suited to animation and computer-generated video content. In addition, the animation compressor can be used to compress sequences of screen images, as might be generated for a training application.

The algorithm employed by the animation compressor is similar to applying the PICT image format to the temporal domain. A PICT image is stored in run-length encoded format and is lossless. The animation compressor also stores images in run-length encoded format. However, the animation compressor can work in either a lossy or lossless mode. The lossless mode maintains picture content precisely, storing an animation as a series of run-length encoded images. The lossy mode loses some quality, but is fast enough for real-time playback.

The animation compressor's performance and achieved compression ratios are highly dependent on the type of images in a scene. The animation compressor is very sensitive to picture changes, and works best on a clean image that has been generated synthetically. Images captured from

videotape generally have considerable visual noise, which can corrupt the inherent similarity of the pixels and make it more difficult for the animation compressor to achieve good compression.

On a Macintosh IIsi using a compression ratio of 1.3:1, the animation compressor can compress a 24-bit 640-by-480 pixel image at a normal quality setting in 2.0 seconds. Decompressing the same image takes 1 second.

Graphics Compressor

The graphics compressor employs a compression algorithm developed by Apple. This compressor is best suited to 8-bit still images and image sequences in applications where compression ratio is more important than decompression speed.

The graphics compressor is a good alternative to the animation compressor whenever performance is less important than compression ratio. In general, the graphics compressor generates a compressed image that is one-half the size of the same image compressed by the animation compressor. However, the graphics compressor can decompress the image at only half the speed of the animation compressor. Therefore, you should consider using the graphics compressor with relatively slow storage devices, such as CD-ROM. In these circumstances, the graphics compressor has sufficient time to decompress the image or image sequence.

On a Macintosh IIsi using a compression ratio of 2.5:1, the graphics compressor can compress a 24-bit 640-by-480 pixel image that has been dithered to 8-bit pixel depth at a normal quality setting in 17.0 seconds. Decompressing the same image takes 1.0 second.

Qume QVT101 Emulation on Macintosh

Revised: 3/4/92
Security: Everyone

Qume QVT101 Emulation on Macintosh

==========

Article Created: 7 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Can the Macintosh emulate a Qume QVT101 terminal (a superset of VT100)?

When I use standard VT100 emulation on the Qume QVT101, I can't do some operations. The Qume QVT101 has some extra features on top of the normal VT100, and applications on the mini want to see the QVT100 and use those additional features.

DISCUSSION -----

We checked with Qume and found that the Qume QVT 101 emulated the Hazeltine 1500, TeleVideo 910 and Lear/Seigler 3A5 terminals. The Qume QVT 101 is an obsolete product.

MacEmulate from Cornerstone Data Systems emulates both the Hazeltine 1500 and the Televideo 910.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder. Or search on "Cornerstone".

DAL 1.3: Recognizing Public Synonyms in Oracle (6/93)

==========

Article Created: 13 February 1992

Article Change History

06/11/93 - UPDATED
- DAL 1.3.6 available

TOPIC ----------

I'm having a problem with the DAL Oracle adapter for Oracle version 6.0. Apparently, objects specified through public synonyms aren't recognized. To reproduce the problem, create a table in one account with a public synonym and grant SELECT on the table to the public. Next, log on with a different account and try to access the table using the synonym. This doesn't work. DAL will, however, recognize the table by way of owner.table_name. It appears that the adapter isn't querying the view ALL_SYNONYMS to provide complete access to a user's accessible objects.

This is our configuration:

- DAL version 1.3

- Oracle Adapter 1.3 for Oracle 6.0

DISCUSSION ----------

This problem has been fixed in DAL 1.3.6. Update DAL to the current version.

- If you purchased PATHWORKS from DEC, contact DEC.

- If you have a DAL support contract with the Direct Response Center (DRC) or are under DRC support warranty, contact the DRC.

DEC VT100, 101, and 102 Terminals: Have No Function Keys

Revised: 3/9/92
Security: Everyone

DEC VT100, 101, and 102 Terminals: Have No Function Keys

==========

Article Created: 13 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

We're installing MacTerminal 3.0 on a Macintosh SE/30 with an extended keyboard II to do VT100, 101, or 102 emulation on a SCO Xenix 2.3.4 system. The function keys 1 through 5 don't operate.

DISCUSSION -----

Because you're trying to emulate DEC VT100, VT101, or VT102 terminals, we assume you're using the VT102 Tool rather than VT320.

This isn't a problem with MacTerminal 3.0, or the VT102 Tool. If you look at the real DEC VT100, 101, or 102 terminals, they don't have any Function Keys such as F1 through F20. They only have the PF keys, PF1 through PF4 -- the top four keys on the keypad. The VT102 Tool maps these keys to the Keys menu, or the Macintosh keyboard keypad:

	Key Pad Keys
PF1	Num lock/Clear
PF2	=
PF3	/
PF4	*

So, since the VT102 Tool emulates the VT102 terminal, it doesn't have to provide the function keys F1 through F5, which don't exist on the real terminal.

On the real VT320 keyboard, F1 through F5 are Hold Screen, Print Screen, Set Up, F4, and Break, respectively. The VT320 emulates all except the F4 keys in the VT320 Tool using the File Menu, Settings Menu, Session Menu, or

Option Keys combination.

You will have to reprogram your application to accept other keys, if that's possible. The VT320 Tool will allow mapping of function keys F6 through F20.

AppleTalk, TCP/IP, and IPX: Simultaneous Routing

Revised: 3/24/92
Security: Everyone

AppleTalk, TCP/IP, and IPX: Simultaneous Routing

==========

Article Created: 6 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Are there any third-party software products that allow simultaneous routing of TCP/IP, IPX, and AppleTalk?

DISCUSSION -----

Novell

There's a Novell router-only product -- basically a Novell 3.11 server without the server capabilities. The product name is Novell Multiprotocol Router 1.0. It supports the routing of IPX, TCP/IP, AppleTalk, and Arcnet.

The NetWare Multi-Protocol Router v1.0 provides customers with a standalone router solution that includes the AppleTalk router. The Multi-Protocol Router provides routing of AppleTalk packets across a Novell network.

IBM

The IBM 6611 Network Processor routes AppleTalk protocol. The IBM 6611 -- which also supports routing for TCP/IP, DECnet, NetBIOS, IPX and XNS networks and SNA data link switching -- enables AppleTalk users to connect to a wide variety of local and remote communications resources located on their network.

AppleTalk

AppleTalk, Apple's local area network protocol suite, is built into every Macintosh computer and networked LaserWriter, and provides users with easy access to network resources. The dynamic nature of AppleTalk allows easy growth, change and automatic reconfiguration of networks. AppleTalk

ensures resources are viewed in a consistent manner, independent of the computing platform on which the resources reside. AppleTalk protocols are broadly licensed and supported by leading equipment manufacturers.

FriendlyNet: Fiber-Optic Transceivers

Revised: 3/26/92
Security: Everyone

FriendlyNet: Fiber-Optic Transceivers

==========

Article Created: 11 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I need to know if anyone manufactures a fiber transceiver for the Macintosh to plug into the Quadra (Friendly Net connector). We're running fiber instead of twisted/thin/thick Ethernet cable. It will be at Ethernet speed, but the cable type is fiber. Do you know of any companies that have such a product?

DISCUSSION -----

There are no FriendlyNet compatible fiber-optic transceivers available at this time. The Ethernet specification (10BASE-F) for data transmission using fiber hasn't yet been approved as a final specification. There are several vendor-specific implementations of fiber-based Ethernet, but most are incompatible with each other and with the proposed 10BASE-F specification. Several vendors have fiber-optic transceivers you can attach to the FriendlyNet thicknet transceiver option.

```
[Mac]-----------------[FTT]-------------------------[FT]------ENET--
AAUI              FriendlyNet                    Std. AUI   Fiber
Cable             Thicknet transceiver           Cable      Transceiver
```

If you have a fiber plant installed with an Ethernet running, you should have access to these types of transceivers from the vendor who originally supplied the fiber network components. Allied Telesis, BlackBox, and Canary all sell fiber transceivers.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

PowerBook Modem: Workaround for 40-Char Command Buffer Limit

Revised: 5/16/94
Security: Everyone

PowerBook Modem: Workaround for 40-Char Command Buffer Limit

==========

Article Created: 3 February 1992
Article Reviewed/Updated: 5 August 1992

TOPIC ----------

Does the PowerBook modem have a data register of 40 characters? I'm trying to dial a Sprint number, and the modem cuts off characters after 40 digits. I'm using White Knight, and can't send the whole string of characters. Is there a workaround? Is this a limitation of the modem?

DISCUSSION ----------

Yes, there is a 40-character command buffer limit in the PowerBook modem, but there is a workaround.

By using the ; (semicolon) command, you can enter phone numbers (or any command for that matter) longer than 40 characters. You will need to break the phone number up into two separate commands, each less than 40 characters. The semicolon (;) command returns the modem to local command state after dialing. You must put the semicolon (;) at the end of the dialing command.

For example, if you want to dial (408) 555-1212, follow these steps:

1) Enter: ATDT408555;
2) Press RETURN.
3) Wait for OK.
4) Enter: ATDT1212
5) Press RETURN.

MacTCP: Syntax of Hosts File (4/96)

Revised: 4/20/96
Security: Everyone

MacTCP: Syntax of Hosts File (4/96)

==========

Article Created: 30 January 1992
Article Reviewed/Updated: 20 April 1996

TOPIC --

I have a question about the Host file for MacTCP used in the remote commands to edit/create in MacX. With the Host... button I can select the connection method and the host. The MacX documentation specifies that the Host List will contain the names in the Hosts file of the System Folder.

How is the Host file created and what is the format? I haven't been able to get any names to appear in this list, so I use the network dot address for testing. I've tried creating a Host file like the /etc/hosts file on A/UX with TeachText (format <dot address> <host name>), but with no success.

DISCUSSION --

NOTE: The syntax for a Hosts file under Open Transport TCP/IP is different. See Technical Information Library article, "Open Transport 1.1/TCP Supports HOSTS File", for Open Transport.

The syntax of the Hosts file used with MacTCP conforms to the master file syntax specified in RFC (Request For Comment) 1035. Here is the syntax:

name type data [;comment]

• name = the name assigned to a host or domain on the internet.

• type = the type is one of the three below:

- "A" for address
- "NS" for Name Server
- "CNAME" for Canonical name

• data = determined by the type specified

• comment = this is optional and begins with a semicolon (;)

The syntax of /etc/hosts file in A/UX is not compatible with the syntax of RFC 1035.

You can use a sample Hosts file which is included in the MacTCP software distribution to edit/add/delete entries and create a new Hosts file for your network.

Here are sample entries in a Hosts file:

```
roland1 A   130.252.11.27     ;     Mike Berg
bruce A     130.252.11.30     ;
windx A     130.252.11.31     ;     Rudy Martin
rizzi A     130.252.11.32     ;     John Rizzi
scoodt A    130.252.11.33     ;     Rudy Martin
renee1 A    130.252.11.34     ;     Renee Gibson

A/UX: TCP/IP Routing Via Ethernet and SL/IP (8/94)

==========

Article Created: 3 February 1992
Article Reviewed/Updated: 23 August 1994

TOPIC ----------

I know that A/UX supports the routing of TCP/IP protocols and services between two Ethernet networks when the A/UX system is properly configured and has two Ethernet adapters in it.

I also know that A/UX supports SL/IP connections for providing TCP/IP protocols and services over direct or dial-up serial connections.

Can A/UX support TCP/IP routing between two networks, one via an Ethernet connection, and the other via SL/IP?

DISCUSSION ----------

Yes, A/UX supports TCP/IP routing among networks. In A/UX, however, the "ipforwarding" parameter was turned off when it is installed, so that a host can't arbitrarily become a gateway.

You can turn the "ipforwarding" parameter back on by doing the following adb (kernel debugger) command:

```
     # adb -w /unix
 ===> a.out file = /unix (COFF format)
 ===> cannot open core
 ===> ready
      ipforwarding?D
 ===> ipforwarding:   0
      ipforwarding?W 1
 ===> ipforwarding:   0x0      =     0x1
      $w
      $q
 ===> #
```

Then restart A/UX so that the change will take effect. You might also want to make the same change to the /etc/install.d/boot.d/bnet_dr file (adb -w bnet_dr) in case you build a new kernel via newconfig at some later date.

If you would rather not restart, do this:

```
     # adb -w -w /unix /dev/kmem
 ===> a.out file = /unix (COFF format)
 ===> core file = /dev/kmem
 ===> ready
      ipforwarding/W 1
 ===> ipforwarding:   0x0        =    0x1
      $w
      $q
```

This changes the running kernel (/dev/kmem) without affecting what will happen after the next start. You can do both changes in one session. The "-k" flag is recommended when working on standalone programs such as the kernel (that's why it's named "-k").

A/UX: When It Builds a New Kernel

Revised: 9/16/92
Security: Everyone

A/UX: When It Builds a New Kernel

==========

Article Created: 4 February 1992

Article Change History

04/30/92 - REVIEWED
- For technical accuracy

TOPIC ----------

Sometimes A/UX automatically builds a new kernel when I change the hardware configuration (different CPU type, more memory, new Ethernet card). Other times it doesn't, and just starts fine on the new configuration.

When and why does A/UX decide to build a new kernel?

DISCUSSION ----------

In general, A/UX rebuilds a new kernel for the following reasons:

- Someone has removed the existing NuBus card (which has driver like ae6 in kernel) such as Ethernet or EtherTalk card, or SuperMac Comm Card, and replaces it into a DIFFERENT slot.

- Someone adds a new NuBus card (with the driver that came with A/UX) onto the system.

- Someone issues a "newconfig" command.

If you move an A/UX drive onto a different CPU and the NuBus card matches the one in A/UX, then A/UX won't rebuild its kernel when it starts. Otherwise, it should rebuild a new kernel to match the existing hardware.

Adding or removing memory doesn't require a new kernel rebuild. A/UX

automatically recognizes its available memory size at startup.

Adding or removing video cards doesn't require a new kernel either since there is no new driver in A/UX to configure.

MacX: Isn't OSF Compliant

==========

Article Created: 5 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Is MacX OSF compliant, as opposed to complying, to the International UNIX standards?

A 1989 Tech Info article, "A/UX: X Windows Questions and Answers," states that Integrated Computer Solutions offers an OSF compliant X Window by providing a MOTIF Window Manager. Is this still the case?

DISCUSSION ----------

MacX isn't OSF compliant. It's based on X11 Release 4 Window System Protocols; it has nothing to do with OSF or UNIX International's UNIX standards. OSF (Open Software Foundation) and UNIX International are two major UNIX organizations trying to set their standards for the UNIX industry; they aren't particularly discussing X Windows. The X Consortium is the one that defines and sets all the standards for X Window system. Apple is a member of all three organizations.

MOTIF is an X Window Manager, developed by OSF. (It follows X protocols of course.) The product is sometimes called MOTIF/OSF, since it's an OSF product. ICS (Integrated Computer Solutions) is a company that ported in the MOTIF Window Manager for A/UX.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Alysis Systems' Compatibility INIT: How it Works on the Quadra

==========

Article Created: 5 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC --

How does the Alysis Systems Compatibility INIT for the Quadra series work?

DISCUSSION --

Alysis Systems Cache Switch INIT on Quadra

The Alysis Compatibility INIT 2.2 automatically toggles the cache on the Quadra 700 and 900, on-the-fly without having to restart. It also toggles the cache between compatible and non-compatible applications while you are multi-tasking. Unlike earlier versions, version 2.2 will also recognize non-compatible Apple Menu Items (DAs). Users may add names of programs they find to be incompatible with the Quadra or delete them as they become compatible. Businesses and resellers are required to contact Alysis Software for licensing and distribution rights.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Apple's Internal Cache Switch on Quadra

Don't change the caches on or off without restarting a Quadra 700, or you may encounter LocalTalk network problems. When the Quadra 700 starts, the system determines its effective processor speed (this has nothing to do with the 68040's clock speed, and everything to do with the mode of the processor's caches), and sets certain internal timings according to this effective processor speed.

Two of the more important timings are for the floppy disk drive and LocalTalk. Therefore, when the Quadra 700's caches are switched without restarting, the timings set at startup are no longer valid, and the floppy disk drive and LocalTalk won't work (or won't work properly). We monitored a Quadra 700 after switching the caches on the fly. It transmitted an inordinate amount of fragmented packets and never successfully registered itself on the network, or registered and never located network services.

The Quadra 900 features the Peripheral Interface Controllers (PIC chips) of the Macintosh IIfx. These I/O processors seem to work OK after having the caches switched on/off on the fly, but we have a lot more testing to do before we recommend this procedure.

Note the third-party cache switches routinely switch the caches on or off on the fly, whereas the cache switch Apple distributes on the Tidbits disk will only turn on or off the caches immediately if you hold down the option key when changing the cache setting.

TOPIC ----------

Does the Quadra 700 support MacX?

DISCUSSION ----------

Yes, Quadra 700 supports MacX. Basically, all Macintosh computers from Macintosh Plus up to the Quadra 900 and PowerBooks with at least 2MB of RAM and with system software version 6.0.5 or later supports MacX.

The Macintosh 512K may run MacX too if you can upgrade the third-party RAM to at least 2MB. For color display, we recommend at least 4MB.

A/UX: Converting from Apple Single to Apple Double Format

==========

Article Created: 6 February 1992

Article Change History

05/07/92 - REVIEWED
- For technical accuracy

01/06/93 - REVISED
- To expand information about the fcnvt utility.

TOPIC ----------

Is there a utility that will convert from Apple Single format to Apple Double format (Resource and Data Fork) and back?

DISCUSSION ----------

A utility program called 'fcnvt' comes with A/UX, and is a hybrid application with A/UX and Macintosh Toolbox calls. Under A/UX the 'fcnvt' utility converts a file in one storage format to a corresponding file in a different storage format.

We suggest you upload files to A/UX and make any conversion there, then download to the Macintosh operating system.

The formats supported are:

AppleDouble
AppleSingle
MacBinary
BinHex
Plain Pair
Plain Triple

A/UX also provides the utility 'setfile' that lets you set a file TYPE and

CREATOR. It also lets you set file attributes (that is, invisible, locked, and so on).

For more information on either of these commands look in the A/UX manual pages or use the A/UX man program.

Revised: 9/22/94
Security: Everyone

A/UX: Only One Macintosh Environment Allowed (9/94)

==========

Article Created: 14 February 1992
Article Reviewed/Updated: 22 September 1994

TOPIC ----------

I would like to run two copies of the Finder of A/UX 2.0.1 or 3.0 so that I then can run two copies of AppleShare on a computer. Is it possible to have two Macintosh environments running under A/UX?

DISCUSSION ----------

No, it isn't possible for two Macintosh environments to run simultaneously under A/UX 2.0.1 or A/UX 3.0. Only one Macintosh environment is allowed under A/UX. When the "mac32" or "mac24" process is invoked, it actually starts up the "startmac" or "startmac24" program to create a Macintosh environment. Then the Finder in the System Folder will be executed. This operation is running under Macintosh Toolbox File Manager control; it isn't a re-entrant type of program.

Note that A/UX is capable of supporting Macintosh File Sharing (in A/UX 3.0) and AppleShare CLIENT functionality. The AWS 95 can run AppleShare Pro.

Security: Everyone

Macintosh: National Computer Security Center Ratings

==========

Article Created: 14 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What is the Macintosh computer's security rating?

DISCUSSION ----------

The NCSC (National Computer Security Center) evaluation criteria define seven levels of trust called Classes. In increasing order of trust, they are: D, C1, C2, B1, B2, B3, and A1.

```
  D       C1       C2      B1      B2     B3      A1
<-------------------------------------------------->
  not                 increasing security         highly
  secure                                          secure
```

D systems aren't trusted. A1 systems are extremely resistant to compromise.

Up to the level of B3, each Class introduces additional features and functions to counter specific threats that weren't countered by lower Classes. For example:

- C2 introduces the "audit" function.
- B1 adds "security labels" to all objects.
- B2 adds a "trusted path."
- B3 adds a "trusted recovery" feature.

Class A1 adds no features or functions over Class B3 system. The software system for a Class A1 system is identical to Class B3 system. However, the Class A1 system is more trusted because it is subjected to extremely rigorous design verification, threat analysis, construction, testing,

inspection, distribution, and operational procedures covering hardware, firmware, and software.

AppleShare meets C1 class because it contains Discretionary Access Control (DAC). You may contact Apple Federal System Groups for more information on the secured Macintosh systems.

Ethernet NB Card: Install EtherTalk 2.5.1 or Later

Revised: 5/7/92
Security: Everyone

Ethernet NB Card: Install EtherTalk 2.5.1 or Later

==========

Article Created: 29 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

We have a Macintosh IIsi with an Ethernet NB card, and we're having problems installing EtherTalk software from the System 7.0.1 disks. When we choose EtherTalk, the software appears to be installed, but it doesn't work.

However, when we first install System 7.0.1, and then install the EtherTalk software from the EtherTalk 2.5.1 disk, everything works correctly.

DISCUSSION ----------

The EtherTalk software that ships with System 7.0 and System 7.0.1 was written prior to the introduction of the Ethernet NB board. In this case, the software was written with System 7.0 and carried forward to System 7.0.1, so it doesn't install an Ethernet driver for the Ethernet NB board. It only installs a driver for the older EtherTalk NB board and the built-in Ethernet on the Macintosh Quadras.

You can find the most current versions of Ethernet software for all of our boards on the NSI 1.1 disk. You can find an image of this disk in the Software Updates folder on AppleLink.

Macintosh Parity-Equipped: Parity Bits Reset Between RAM and VM

Revised: 5/7/92
Security: Everyone

Macintosh Parity-Equipped: Parity Bits Reset Between RAM and VM

==========

Article Created: 30 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Will a parity-equipped Macintosh (with virtual memory enabled), such as the Macintosh IIci, maintain parity when paging information between RAM and virtual memory?

DISCUSSION -----

The question implies a loss of functionality if the parity bits aren't written out to virtual memory. Actually, this isn't the case. Virtual memory has no need to keep track of the RAM parity bits in parity-equipped Macintosh computers.

The reason is that the parity bits are set when you write to RAM. When virtual memory pages information back into RAM, the parity bits are set once again as appropriate. Since the parity bits are for handling data corruption in RAM, once you write to disk, it's up to the disk, its driver, and the file system to ensure data integrity rather than using the same mechanism used in "parity" RAM.

Also, when virtual memory reads the information in RAM, it doesn't have access to the parity bits. It reads a byte; it gets that byte's value.

Finally, imagine the excess overhead associated with moving around and storing that additional information. If you had 16MB set for virtual memory, you would need an extra 2MB of disk space just to handle the parity bits.

Mac OS System Error Codes: -299 to -5553

Article ID: 9804
Created: 2/25/92
Modified: 1/12/00

TOPIC

The following list provides an explanation of system errors -299 to -5553.

DISCUSSION

Note: Items listed in [brackets] are old result code meanings.
Note: ???? This information wasn't available.

Notification Manager Error

-299	nmTypErr	Invalid qTypeÐmust be ORD(nmType)

Start Manager Errors

-290	smSDMInitErr	SDM could not be initialized.
-291	smSRTInitErr	Slot Resource Table could not be initialized.
-292	smPRAMInitErr	Slot Resource Table could not be initialized.
-293	smPriInitErr	Cards could not be initialized.
-300	smEmptySlot	No card in slot
-301	smCRCFail	CRC check failed for declaration data
-302	smFormatErr	FHeader Format is not Apple's
-303	smRevisionErr	Wrong revison level
-304	smNoDir	Directory offset is Nil
-305	smLWTstBad	Long Word test field <> $5A932BC7.
-306	smNosInfoArray	No sInfoArray. Memory Mgr error.
-307	smResrvErr	Fatal reserved error. Reserved field <> 0.
-308	smUnExBusErr	Unexpected Bus Error
-309	smBLFieldBad	ByteLanes field was bad.
-310	smFHBlockRdErr	Error occured during _sGetFHeader.
-311	smFHBlkDispErr	Error occured during _sDisposePtr (Dispose of FHeader block).
-312	smDisposePErr	_DisposePointer error
-313	smNoBoardsRsrc	No Board sResource.
-314	smGetPRErr	Error occured during _sGetPRAMRec (See SIMStatus).
-315	smNoBoardId	No Board Id.
-316	smIntStatVErr	The InitStatusV field was negative after primary or secondary init.
-317	smIntTblVErr	An error occured while trying to initialize the Slot Resource Table.
-318	smNoJmpTbl	SDM jump table could not be created.
-319	smBadBoardId	BoardId was wrong, re-init the PRAM record.
-320	smBusErrTO	BusError time out.
-330	smBadRefId	Reference Id not found in list
-331	smBadsList	Bad sResource [sList] structure: Id1<Id2<Id3 ╔ format is not followed.
-332	smReservedErr	Reserved field not zero
-333	smCodeRevErr	Code revision is wrong
-334	smCPUErr	Code revision is wrong
-335	smsPointerNil	LPointer is nil {From sOffsetData. If this error occurs, check sInfo rec for more information.}
-336	smNilsBlockErr	Nil sBlock error {Don't allocate and try to use a nil sBlock}
-337	smSlotOOBErr	Slot out of bounds error
-338	smSelOOBErr	Selector out of bounds error; function not implemented
-339	smNewPErr	_NewPtr error
-340	smBlkMoveErr	_BlockMove error
-341	smCkStatusErr	Status of slot = fail.
-342	smGetDrvrNamErr	Error occured during _sGetDrvrName.

-343 smDisDrvrNamErr Error occured during _sDisDrvrName.
-344 smNoMoresRsrcs No more sResources *OR*
-344 smNoMoresResources Specified sResource data structure not found
-345 smsGetDrvrErr Error occurred during _sGetDriver.
-346 smBadsPtrErr Bad pointer was passed to sCaldSPointer function
-347 smByteLanesErr ByteLanes field in card's format block was determined to be zero
-348 smOffsetErr Offset was too big (temporary, should be fixed)
-349 smNoGoodOpens No opens were successfull in the loop.
-350 smSRTOvrFlErr SRT over flow.
-351 smRecNotFnd Record not found in the SRT.

Device Manager Slot Support Errors
-360 slotNumErr invalid slot # error
-400 gcrOnMFMErr gcr format on high density media error

Edition Manager Errors
-450 editionMgrInitErr Manager not initialized or could not load package
-451 badSectionErr Not a valid section type
-452 notRegisteredSectionErr Not registered
-454 badSubPartErr Bad edition container spec or invalid edition container
-460 multiplePublisherWrn Already is a publisher
-461 containerNotFoundWrn Alias was not resolved
-463 notThePublisherWrn Not the publisher

SCSI Manager Errors
-470 scsiBadPBErr invalid field(s) in the parameter block
-471 scsiOverrunErr attempted to transfer too many bytes
-472 scsiTransferErr write flag conflicts with data transfer phase
-473 scsiBusTOErr bus error during transfer
-474 scsiSelectTOErr scsiSelTO exceeded (selection failed)
-475 scsiTimeOutErr scsiReqTO exceeded
-476 scsiBusResetErr the bus was reset, so your request was aborted
-477 scsiBadStatus non-zero (not "Good") status returned
-478 scsiNoStatusErr device did not go through a status phase
-479 scsiLinkFailErr linked command never executed
-489 scsiUnimpVctErr unimplemented routine was called

SysErrs used instead of inline $A9FF & $ABFF
-490 userBreak user debugger break
-491 strUserBreak user debugger break - display string on stack
-492 exUserBreak user debugger break - execute commands on stack

QuickDraw Error
-500 rgnTooBigErr Bitmap would convert into a region greater than 64 KB

Text Edit Error
-501 teScrapSizeErr scrap item too big for text edit record

O/S Error
-502 hwParamrErr bad selector for _HWPriv

Processes Errors
-600 procNotFound No eligible process with specified process serial number
-601 memFragErr Not enough room to launch application w ith special requirements
-602 appModeErr Memory mode is 32-bit, but application is not 32-bit clean
-603 protocolErr app made module calls in improper order
-604 hardwareConfigErr hardware configuration not correct for call
-605 appMemFullErr Partition size specified in 'SIZE' resource is not big enough for launch
-606 appIsDaemon Application is background-only
-607 bufferIsSmall Buffer is too small
-608 noOutstandingHLE No outstanding high-level event
-609 connectionInvalid Connection is invalid
-610 noUserInteractionAllowed Attempted PostHighLevelEvent from background and no session yet established

Memory Dispatch Errors
-620 notEnoughMemoryErr Insufficient physical memory
-621 notHeldErr Specified range of memory is not held
-622 cannotMakeContiguousErr Cannot make specified range contiguous
-623 notLockedErr Specified range of memory is not locked
-624 interruptsMaskedErr Called with interrupts masked
-625 cannotDeferErr Unable to defer additional user functions

DatabaseAccess (Pack 13) Errors

-800	rcDBNull	The data item was NULL
-801	rcDBValue	Data available or successfully retrieved
-802	rcDBError	Error executing function
-803	rcDBBadType	Next data item not of requested data type
-804	rcDBBreak	Function timed out
-805	rcDBExec	Query currently executing
-806	reDBBadSessID	Session ID is invalid
-807	rcDBBadSessNum	Invalid session number
-808	rcDBBadDDEV	Couldn't find the specified database extension, or error occurred in opening database extension
-809	rcDBAsyncNotSupp	The database extension does not support asynchronous calls
-810	rcDBBadAsyncPB	Invalid parameter block specified
-811	rcDBNoHandler	There is no handler for this data type installed for the current application
-812	rcDBWrongVersion	Wrong version number
-813	rcDBPackNotInited	The InitDBPack function has not yet been called

Help Manager Errors

-850	hmHelpDisabled	Help balloons are not enabled
-851	hmResNotFound	????
-852	hmMemFullErr	????
-853	hmBalloonAborted	Because of constant cursor movement, the help balloon wasn't displayed
-854	hmSameAsLastBalloon	Menu and item are same as previous menu and item
-855	hmHelpManagerNotInited	Help menu not set up
-856	hmBadSelector	????
-857	hmSkippedBalloon	No ballon content to fill in
-858	hmWrongVersion	Wrong version of Help Manager resource
-859	hmUnknownHelpType	Help message record contained a bad type
-860	hmCouldNotLoadPackage	????
-861	hmOperationUnsupported	Bad method parameter
-862	hmNoBalloonUp	No balloon showing
-863	hmCloseViewActive	User using CloseView won't let you remove balloon

AppleTalk Ð PPC Toolbox Errors

-900	notInitErr	PPC Toolbox has not been initialized yet
-902	nameTypeErr	Invalid or inappropriate locationKindSelector in location name
-903	noPortErr	Invalid port name; Unable to open port or bad port reference number
-904	noGlobalsErr	System unable to allocate memory, critical error
-905	localOnlyErr	Network activity is currently disabled
-906	destPortErr	Port does not exist at destination
-907	sessTableErr	PPC Toolbox is unable to create a session
-908	noSessionErr	Invalid session reference number
-909	badReqErr	Bad parameter or invalid state for this operation
-910	portNameExistsErr	Another port is already open with this name
-911	noUserNameErr	User name unknown on destination machine
-912	userRejectErr	Destination rejected the session request
-915	noResponseErr	Unable to contact application
-916	portClosedErr	The port was closed
-917	sessClosedErr	The session has closed
-919	badPortNameErr	PPC port record is invalid
-922	noDefaultUserErr	User has not specified owner name in Sharing Setup control panel
-923	notLoggedInErr	Default user reference number does not yet exist
-924	noUserRefErr	Unable to create a new user reference number
-925	networkErr	An error has occurred in the network
-926	noInformErr	PPCStart failed because target application did not have an inform pending
-927	authFailErr	User's password is wrong
-928	noUserRecErr	Invalid user reference number
-930	badServiceMethodErr	Service method is other than ppcServiceRealTime
-931	badLocNameErr	Location name is invalid
-932	guestNotAllowedErr	Destination port requires authentication

AppleTalk - NBP Errors

-1024	nbpBuffOvr	Buffer overflow in LookupName
-1025	nbpNoConfirm	Name not confirmed on ConfirmName
-1026	nbpConfDiff	Name confirmed at different socket
-1027	nbpDuplicate	Duplicate name exists already
-1028	nbpNotFound	Name not found on remove
-1029	nbpNISErr	Error trying to open the NIS

ASP Errors (XPP driver)

-1066	aspBadVersNum	Server cannot support this ASP version
-1067	aspBufTooSmall	Buffer too small

-1068 aspNoMoreSess No more sessions on server
-1069 aspNoServers No servers at that address
-1070 aspParamErr Parameter error
-1071 aspServerBusy Server cannot open another session
-1072 aspSessClosed Session closed
-1073 aspSizeErr Command block too big
-1074 aspTooMany Too many clients (server error)
-1075 aspNoAck No ack on attention request (server err)

AppleTalk - ATP Errors

-1096 reqFailed Request to contact router failed: retry count exceeded
-1097 tooManyReqs Too many concurrent requests
-1098 tooManySkts Too many concurrent responding-sockets
-1099 badATPSkt Bad ATP-responding socket
-1100 badBuffNum Bad response buffer number specififed
-1101 noRelErr No release received
-1102 cbNotFound Control Block not found; no pending asynchronous calls
-1103 noSendResp AddResponse issued without SendResponse
-1104 noDataArea No data area for request to MPP
-1105 reqAborted ERdCancel function called for this ERead [SendRequest aborted by RelTCB]

Data Stream Protocol - DSP driver Errors

-1273 errOpenDenied Open request denied by recipient
-1274 errDSPQueueSize Send or receive queue is too small
-1275 errFwdReset Read terminated by forward reset
-1276 errAttention Attention message too long
-1277 errOpening Attempt to open connection failed
-1278 errState Bad connection state for this operation
-1279 errAborted Request aborted by dspRemove or dspClose function
-1280 errRefNum Bad connection reference number

HFS Errors

-1300 fidNotFound File ID not found [No file thread exists]
-1301 fidExists File id already exists
-1302 notAFileErr Specified file is a directory
-1303 diffVolErr Files on different volumes
-1304 catChangedErr Catalog has changed and CatPosition may be invalid
-1305 desktopDamagedErr The desktop database has become corrupted Ð the Finder will fix this, but if your application is not running with the Finder, use DTReset or DTDelete

AppleEvent Errors

-1700 errAECoercionFail Data could not be coerced to the requested descriptor type
-1701 errAEDescNotFound Descriptor record was not found
-1702 errAECorruptData Data in an Apple event could not be read
-1703 errAEWrongDataType Wrong descriptor type
-1704 errAENotAEDesc Not a valid descriptor record
-1705 errAEBadListItem Operation involving a list item failed
-1706 errAENewerVersion Need a newer version of the Apple Event Manager
-1707 errAENotAppleEvent Event is not an Apple event
-1708 errAEEventNotHandled Event wasn't handled by an Apple event handler
-1709 errAEReplyNotValid AEResetTimer was passed an invalid reply
-1710 errAEUnknownSendMode Invalid sending mode was passed
-1711 errAEWaitCanceled User canceled out of wait loop for reply or reciept
-1712 errAETimeout Apple event timed out
-1713 errAENoUserInteraction No user interaction allowed
-1714 errAENotASpecialFunction Wrong keyword for a special function
-1715 errAEParamMissed Handler did not get all required paramters
-1716 errAEUnknownAddressType Unknown Apple event address type
-1717 errAEHandlerNotFound No handler found for an Apple event or a coersion
-1718 errAEReplyNotArrived Reply has not yet arrived
-1719 errAEIllegalIndex Not a valid list index

AppleTalk - ATP Errors

-3101 buf2SmallErr Packet too large for buffer; partial data returned
-3102 noMPPErr No MPP error
-3103 ckSumErr Check sum error
-3104 extractErr Extraction error
-3105 readQErr Read queue error
-3106 atpLenErr ATP length error
-3107 atpBadRsp ATP bad response error
-3108 recNotFnd Record not found
-3109 sktClosedErr Socket closed error

Print Manager w/LaserWriter

```
-4096 ???             No free Connect Control Blocks available
-4097 ???             Bad connection reference number
-4098 ???             Request already active
-4099 ???             Write request too big
-4100 ???             Connection just closed
-4101 ???             Printer not found, or closed
```

File Manager Extensions Errors

```
-5000 accessDenied    Incorrect access for this file/folder
-5006 DenyConflict    Permission/Deny mode conflicts with the current
                    mode in which this fork is already open
-5015 NoMoreLocks     Byte range locking failure from Server
-5020 RangeNotLocked  Attempt to unlock an already unlocked range
-5021 RangeOverlap    Attempt to lock some of an already locked range
```

AFP Errors (XPP driver)

```
-5000 afpAccessDenied        AFP Access denied
-5001 afpAuthContinue        AFP Authorization continue
-5002 afpBadUAM              AFP Bad UAM
-5003 afpBadVersNum          AFP Bad version number
-5004 afpBitmapErr           AFP Bit map error
-5005 afpCantMove            AFP Can't move error
-5006 afpDenyConflict        AFP Deny conflict
-5007 afpDirNotEmpty         AFP Dir not empty
-5008 afpDiskFull            AFP Disk full
-5009 afpEofError            AFP End-of-File error
-5010 afpFileBusy            AFP File busy
-5011 afpFlatVo              AFP Flat volume
-5012 afpItemNotFound        AFP Information not found
-5013 afpLockErr             AFP Lock error
-5014 afpMiscErr             AFP Misc error
-5015 afpNoMoreLocks         AFP No more locks
-5016 afpNoServer            AFP No server
-5017 afpObjectExists        AFP Object already exists
-5018 afpObjectNotFound      AFP Object not found
-5019 afpParmErr             AFP Parm error
-5020 afpRangeNotLocked      AFP Range not locked
-5021 afpRangeOverlap        AFP Range overlap
-5022 afpSessClosed          AFP Session closed
-5023 afpUserNotAuth         AFP User not authorized
-5024 afpCallNotSupported    AFP Call not supported
-5025 afpObjectTypeErr       AFP Object type error
-5026 afpTooManyFilesOpen    AFP Too many files open
-5027 afpServerGoingDown     AFP Server going down
-5028 afpCantRename          AFP Can't rename
-5029 afpDirNotFound         AFP Directory not found
-5030 afpIconTypeError       Size of new icon and one it replaces don't match
-5031 afpVolLocked           Volume is Read-Only
-5032 afpObjectLocked        The specified command could not be completed because the object is
                           locked.
-5033 afpContainsSharedErr   The specified share point contains a share point.
-5034 afpIDNotFound          The specified ID could not be found.
-5035 afpIDExists            The specified ID already exists.
-5036 afpDiffVolErr          Equivalent to the Mac OS error code.
-5037 afpCatalogChanged      The catalog has changed and CatPosition may be invalid. No matches
                           were returned.
-5038 afpSameObjectErr       EEquivalent to the Mac OS error code.
-5039 afpBadIDErr            The specified ID is invalid.
-5040 afpPwdSameErr          The new password is the same as the old password.
-5041 afpPwdTooShortErr      The specified password is too short.
-5042 afpPwdExpiredErr       The password has expired.
-5043 afpInsideSharedErr     The specified directory is inside a share point.
-5044 afpInsideTrashErr      The specified directory is in the Trash.
-5045 afpPwdNeedsChangeErr   The password needs to be changed the first time the user logs on.
-5046 afpPwdPolicyErr        The specified password violates a UAM's policy.
-5047 afpAlreadyLoggedOn     The specified user is already logged on.
```

SysEnvirons Errors

```
-5500 envNotPresent   SysEnvirons trap not present--returned by glue.
-5501 envBadVers      Version non-positive
-5502 envVersTooBig   Version bigger than call can handle
```

Gestalt Errors

```
-5550 gestaltUnknownErr       Could not obtain the response
-5551 gestaltUndefSelectorErr Undefined selector
-5552 gestaltDupSelectorErr   Selector already exists
-5553 gestaltLocationErr      Function not in system heap
```

System Errors 7.0.1: Negative Codes (-299 to -5553) (11/95)

==========

Article Created: 31 January 1992
Article Reviewed/Updated: 29 November 1995

TOPIC ----------

The following list provides an explanation of system errors -299 to -5553 as it relates to system software version 7.0.1.

Here's an explanation of two symbols used in the lists:

[Items listed in brackets are old result code meanings]
???? This information wasn't available.

DISCUSSION ----------

Notification Manager Error

-299	nmTypErr	Invalid qType—must be ORD(nmType)

Start Manager Errors

-290	smSDMInitErr	SDM could not be initialized.
-291	smSRTInitErr	Slot Resource Table could not be initialized.
-292	smPRAMInitErr	Slot Resource Table could not be initialized.
-293	smPriInitErr	Cards could not be initialized.
-300	smEmptySlot	No card in slot
-301	smCRCFail	CRC check failed for declaration data
-302	smFormatErr	FHeader Format is not Apple's
-303	smRevisionErr	Wrong revison level
-304	smNoDir	Directory offset is Nil
-305	smLWTstBad	Long Word test field <> $5A932BC7.
-306	smNosInfoArray	No sInfoArray. Memory Mgr error.
-307	smResrvErr	Fatal reserved error. Reserved field <> 0.
-308	smUnExBusErr	Unexpected Bus Error
-309	smBLFieldBad	ByteLanes field was bad.
-310	smFHBlockRdErr	Error occured during _sGetFHeader.
-311	smFHBlkDispErr	Error occured during _sDisposePtr (Dispose of FHeader block).

```
-312  smDisposePErr   _DisposePointer error
-313  smNoBoardsRsrc  No Board sResource.
-314  smGetPRErr      Error occured during _sGetPRAMRec (See SIMStatus).
-315  smNoBoardId     No Board Id.
-316  smIntStatVErr   The InitStatusV field was negative after primary
                      or secondary init.
-317  smIntTblVErr    An error occured while trying to initialize the
                      Slot Resource Table.
-318  smNoJmpTbl      SDM jump table could not be created.
-319  smBadBoardId    BoardId was wrong, re-init the PRAM record.
-320  smBusErrTO      BusError time out.
-330  smBadRefId      Reference Id not found in list
-331  smBadsList      Bad sResource [sList] structure:
                      Id1<Id2<Id3 …  format is not followed.
-332  smReservedErr   Reserved field not zero
-333  smCodeRevErr    Code revision is wrong
-334  smCPUErr        Code revision is wrong
-335  smsPointerNil   LPointer is nil {From sOffsetData. If this error
                      occurs, check sInfo rec for more information.}
-336  smNilsBlockErr  Nil sBlock error {Don't allocate and try to use a
                      nil sBlock}
-337  smSlotOOBErr    Slot out of bounds error
-338  smSelOOBErr     Selector out of bounds error; function not implemented
-339  smNewPErr       _NewPtr error
-340  smBlkMoveErr    _BlockMove error
-341  smCkStatusErr   Status of slot = fail.
-342  smGetDrvrNamErr Error occured during _sGetDrvrName.
-343  smDisDrvrNamErr Error occured during _sDisDrvrName.
-344  smNoMoresRsrcs      No more sResources *OR*
-344  smNoMoresResources  Specified sResource data structure not found
-345  smsGetDrvrErr   Error occurred during _sGetDriver.
-346  smBadsPtrErr    Bad pointer was passed to sCaldSPointer function
-347  smByteLanesErr  ByteLanes field in card’s format block was
                      determined to be zero
-348  smOffsetErr     Offset was too big (temporary, should be fixed)
-349  smNoGoodOpens   No opens were successfull in the loop.
-350  smSRTOvrFlErr   SRT over flow.
-351  smRecNotFnd     Record not found in the SRT.

Device Manager Slot Support Errors
-360  slotNumErr      invalid slot # error
-400  gcrOnMFMErr     gcr format on high density media error

Edition Manager Errors
-450  editionMgrInitErr        Manager not initialized or could not
                               load package
-451  badSectionErr            Not a valid section type
-452  notRegisteredSectionErr  Not registered
-454  badSubPartErr            Bad edition container spec or invalid
                               edition container
-460  multiplePublisherWrn     Already is a publisher
-461  containerNotFoundWrn     Alias was not resolved
-463  notThePublisherWrn       Not the publisher
```

```
SCSI Manager Errors
-470  scsiBadPBErr    invalid field(s) in the parameter block
-471  scsiOverrunErr  attempted to transfer too many bytes
-472  scsiTransferErr write flag conflicts with data transfer phase
-473  scsiBusTOErr    bus error during transfer
-474  scsiSelectTOErr scsiSelTO exceeded (selection failed)
-475  scsiTimeOutErr  scsiReqTO exceeded
-476  scsiBusResetErr the bus was reset, so your request was aborted
-477  scsiBadStatus   non-zero (not "Good") status returned
-478  scsiNoStatusErr device did not go through a status phase
-479  scsiLinkFailErr linked command never executed
-489  scsiUnimpVctErr unimplemented routine was called

SysErrs used instead of inline $A9FF & $ABFF
-490  userBreak       user debugger break
-491  strUserBreak    user debugger break - display string on stack
-492  exUserBreak     user debugger break - execute commands on stack

QuickDraw Error
-500  rgnTooBigErr    Bitmap would convert into a region greater than 64 KB

Text Edit Error
-501  teScrapSizeErr  scrap item too big for text edit record

O/S Error
-502  hwParamrErr     bad selector for _HWPriv

Processes Errors
-600  procNotFound      No eligible process with specified process
                        serial number
-601  memFragErr        Not enough room to launch application
                        w ith special requirements
-602  appModeErr        Memory mode is 32-bit, but application is
                        not 32-bit clean
-603  protocolErr       app made module calls in improper order
-604  hardwareConfigErr hardware configuration not correct for call
-605  appMemFullErr     Partition size specified in 'SIZE' resource is
                        not big enough for launch
-606  appIsDaemon       Application is background-only
-607  bufferIsSmall     Buffer is too small
-608  noOutstandingHLE  No outstanding high-level event
-609  connectionInvalid           Connection is invalid
-610  noUserInteractionAllowed    Attempted PostHighLevelEvent from
                          background and no session yet established

Memory Dispatch Errors
-620  notEnoughMemoryErr      Insufficient physical memory
-621  notHeldErr              Specified range of memory is not held
-622  cannotMakeContiguousErr Cannot make specified range contiguous
-623  notLockedErr            Specified range of memory is not locked
-624  interruptsMaskedErr     Called with interrupts masked
```

```
-625  cannotDeferErr          Unable to defer additional user functions

DatabaseAccess (Pack 13) Errors
-800  rcDBNull          The data item was NULL
-801  rcDBValue         Data available or successfully retrieved
-802  rcDBError         Error executing function
-803  rcDBBadType       Next data item not of requested data type
-804  rcDBBreak         Function timed out
-805  rcDBExec          Query currently executing
-806  reDBBadSessID     Session ID is invalid
-807  rcDBBadSessNum    Invalid session number
-808  rcDBBadDDEV       Couldn't find the specified database extension,
                        or error occurred in opening database extension
-809  rcDBAsyncNotSupp  The database extension does not support
                        asynchronous calls
-810  rcDBBadAsyncPB    Invalid parameter block specified
-811  rcDBNoHandler     There is no handler for this data type
                        installed for the current application
-812  rcDBWrongVersion  Wrong version number
-813  rcDBPackNotInited The InitDBPack function has not yet been called

Help Manager Errors
-850  hmHelpDisabled         Help balloons are not enabled
-851  hmResNotFound          ????
-852  hmMemFullErr           ????
-853  hmBalloonAborted       Because of constant cursor movement,
                            the help balloon wasn't displayed
-854  hmSameAsLastBalloon    Menu and item are same as previous menu and item
-855  hmHelpManagerNotInited Help menu not set up
-856  hmBadSelector          ????
-857  hmSkippedBalloon       No ballon content to fill in
-858  hmWrongVersion         Wrong version of Help Manager resource
-859  hmUnknownHelpType      Help message record contained a bad type
-860  hmCouldNotLoadPackage  ????
-861  hmOperationUnsupported Bad method parameter
-862  hmNoBalloonUp          No balloon showing
-863  hmCloseViewActive  User using CloseView won't let you remove balloon

AppleTalk — PPC Toolbox Errors
-900  notInitErr       PPC Toolbox has not been initialized yet
-902  nameTypeErr      Invalid or inappropriate locationKindSelector
                      in location name
-903  noPortErr        Invalid port name; Unable to open port or bad
                      port reference number
-904  noGlobalsErr     System unable to allocate memory, critical error
-905  localOnlyErr     Network activity is currently disabled
-906  destPortErr      Port does not exist at destination
-907  sessTableErr     PPC Toolbox is unable to create a session
-908  noSessionErr     Invalid session reference number
-909  badReqErr        Bad parameter or invalid state for this operation
-910  portNameExistsErr  Another port is already open with this name
-911  noUserNameErr    User name unknown on destination machine
-912  userRejectErr    Destination rejected the session request
```

```
-915  noResponseErr    Unable to contact application
-916  portClosedErr    The port was closed
-917  sessClosedErr    The session has closed
-919  badPortNameErr   PPC port record is invalid
-922  noDefaultUserErr User has not specified owner name in Sharing Setup
                       control panel
-923  notLoggedInErr   Default user reference number does not yet exist
-924  noUserRefErr     Unable to create a new user reference number
-925  networkErr       An error has occurred in the network
-926  noInformErr      PPCStart failed because target application did not
                       have an inform pending
-927  authFailErr      User's password is wrong
-928  noUserRecErr         Invalid user reference number
-930  badServiceMethodErr  Service method is other than
                          ppcServiceRealTime
-931  badLocNameErr        Location name is invalid
-932  guestNotAllowedErr   Destination port requires authentication

AppleTalk - NBP Errors
-1024 nbpBuffOvr      Buffer overflow in LookupName
-1025 nbpNoConfirm    Name not confirmed on ConfirmName
-1026 nbpConfDiff     Name confirmed at different socket
-1027 nbpDuplicate    Duplicate name exists already
-1028 nbpNotFound     Name not found on remove
-1029 nbpNISErr       Error trying to open the NIS

ASP Errors (XPP driver)
-1066 aspBadVersNum   Server cannot support this ASP version
-1067 aspBufTooSmall  Buffer too small
-1068 aspNoMoreSess   No more sessions on server
-1069 aspNoServers    No servers at that address
-1070 aspParamErr     Parameter error
-1071 aspServerBusy   Server cannot open another session
-1072 aspSessClosed   Session closed
-1073 aspSizeErr      Command block too big
-1074 aspTooMany      Too many clients (server error)
-1075 aspNoAck        No ack on attention request (server err)

AppleTalk -  ATP Errors
-1096 reqFailed  Request to contact router failed: retry count exceeded
-1097 tooManyReqs     Too many concurrent requests
-1098 tooManySkts     Too many concurrent responding-sockets
-1099 badATPSkt       Bad ATP-responding socket
-1100 badBuffNum      Bad response buffer number specififed
-1101 noRelErr        No release received
-1102 cbNotFound      Control Block not found; no pending
                      asynchronous calls
-1103 noSendResp      AddResponse issued without SendResponse
-1104 noDataArea      No data area for request to MPP
-1105 reqAborted      ERdCancel function called for this ERead
                      [SendRequest aborted by RelTCB]
Data Stream Protocol - DSP driver Errors
-1273 errOpenDenied   Open request denied by recipient
```

```
-1274 errDSPQueueSize Send or receive queue is too small
-1275 errFwdReset     Read terminated by forward reset
-1276 errAttention    Attention message too long
-1277 errOpening      Attempt to open connection failed
-1278 errState        Bad connection state for this operation
-1279 errAborted      Request aborted by dspRemove or dspClose function
-1280 errRefNum       Bad connection reference number

HFS Errors
-1300 fidNotFound     File ID not found [No file thread exists]
-1301 fidExists       File id already exists
-1302 notAFileErr     Specified file is a directory
-1303 diffVolErr      Files on different volumes
-1304 catChangedErr   Catalog has changed and CatPosition may be invalid
-1305 desktopDamagedErr  The desktop database has become corrupted —
                      the Finder will fix this, but if your application is
                      not running with the Finder, use DTReset or DTDelete

AppleEvent Errors
-1700  errAECoercionFail     Data could not be coerced to the
                             requested descriptor type
-1701  errAEDescNotFound     Descriptor record was not found
-1702  errAECorruptData      Data in an Apple event could not be read
-1703  errAEWrongDataType    Wrong descriptor type
-1704  errAENotAEDesc        Not a valid descriptor record
-1705  errAEBadListItem      Operation involving a list item failed
-1706  errAENewerVersion     Need a newer version of the Apple Event Manager
-1707  errAENotAppleEvent    Event is not an Apple event
-1708  errAEEventNotHandled  Event wasn't handled by an Apple event handler
-1709  errAEReplyNotValid    AEResetTimer was passed an invalid reply
-1710  errAEUnknownSendMode  Invalid sending mode was passed
-1711  errAEWaitCanceled     User canceled out of wait loop for reply
                             or reciept
-1712  errAETimeout          Apple event timed out
-1713  errAENoUserInteraction    No user interaction allowed
-1714  errAENotASpecialFunction  Wrong keyword for a special function
-1715  errAEParamMissed      Handler did not get all required paramters
-1716  errAEUnknownAddressType   Unknown Apple event address type
-1717  errAEHandlerNotFound  No handler found for an Apple event
                             or a coersion
-1718  errAEReplyNotArrived  Reply has not yet arrived
-1719  errAEIllegalIndex     Not a valid list index

AppleTalk -  ATP Errors
-3101 buf2SmallErr    Packet too large for buffer; partial data returned
-3102 noMPPErr        No MPP error
-3103 ckSumErr        Check sum error
-3104 extractErr      Extraction error
-3105 readQErr        Read queue error
-3106 atpLenErr       ATP length error
-3107 atpBadRsp       ATP bad response error
-3108 recNotFnd       Record not found
```

```
-3109 sktClosedErr    Socket closed error

Print Manager w/LaserWriter
-4096 ???             No free Connect Control Blocks available
-4097 ???             Bad connection reference number
-4098 ???             Request already active
-4099 ???             Write request too big
-4100 ???             Connection just closed
-4101 ???             Printer not found, or closed

File Manager Extensions Errors
-5000 accessDenied    Incorrect access for this file/folder
-5006 DenyConflict    Permission/Deny mode conflicts with the current
                      mode in which this fork is already open
-5015 NoMoreLocks     Byte range locking failure from Server
-5020 RangeNotLocked  Attempt to unlock an already unlocked range
-5021 RangeOverlap    Attempt to lock some of an already locked range

AFP Errors (XPP driver)
-5000 afpAccessDenied     AFP Access denied
-5001 afpAuthContinue     AFP Authorization continue
-5002 afpBadUAM           AFP Bad UAM
-5003 afpBadVersNum       AFP Bad version number
-5004 afpBitmapErr        AFP Bit map error
-5005 afpCantMove         AFP Can't move error
-5006 afpDenyConflict     AFP Deny conflict
-5007 afpDirNotEmpty      AFP Dir not empty
-5008 afpDiskFull         AFP Disk full
-5009 afpEofError         AFP End-of-File error
-5010 afpFileBusy         AFP File busy
-5011 afpFlatVo           AFP Flat volume
-5012 afpItemNotFound     AFP Information not found
-5013 afpLockErr          AFP Lock error
-5014 afpMiscErr          AFP Misc error
-5015 afpNoMoreLocks      AFP No more locks
-5016 afpNoServer         AFP No server
-5017 afpObjectExists     AFP Object already exists
-5018 afpObjectNotFound   AFP Object not found
-5019 afpParmErr          AFP Parm error
-5020 afpRangeNotLocked   AFP Range not locked
-5021 afpRangeOverlap     AFP Range overlap
-5022 afpSessClosed       AFP Session closed
-5023 afpUserNotAuth      AFP User not authorized
-5024 afpCallNotSupported AFP Call not supported
-5025 afpObjectTypeErr    AFP Object type error
-5026 afpTooManyFilesOpen AFP Too many files open
-5027 afpServerGoingDown  AFP Server going down
-5028 afpCantRename       AFP Can't rename
-5029 afpDirNotFound      AFP Directory not found
-5030 afpIconTypeError    Size of new icon and one it replaces don’t match
-5031 afpVolLocked        Volume is Read-Only
-5032 afpObjectLocked     Object is M/R/D/W inhibited
```

SysEnvirons Errors

-5500 envNotPresent	SysEnvirons trap not present - returned by glue.
-5501 envBadVers	Version non-positive
-5502 envVersTooBig	Version bigger than call can handle

Gestalt Errors

-5550 gestaltUnknownErr	Could not obtain the response
-5551 gestaltUndefSelectorErr	Undefined selector
-5552 gestaltDupSelectorErr	Selector already exists
-5553 gestaltLocationErr	Function not in system heap

TITLE

Mac OS System Error Codes: 0 to -261

Article ID: 9805
Created: 2/25/92
Modified: 5/19/99

TOPIC

The following list provides an explanation of system errors 0 to -261.

DISCUSSION

Note: Items listed in [brackets] are old result code meanings.
Note: ???? This information wasn't available.

General System Errors (VBL Mgr, Queue, Etc.)

0	noErr	0 for success *OR*
0	smNotTruncated	No truncation necessary
-1	qErr	queue element not found during deletion *OR*
-1	smTruncErr	Truncation indicator alone is wider than the specified width
-2	vTypErr	invalid queue element
-3	corErr	core routine number out of range
-4	unimpErr	unimplemented core routine
-5	SlpTypeErr	invalid queue element
-8	seNoDB	no debugger installed to handle debugger command

Color Manager Errors

-9	iTabPurgErr	from Color2Index/ITabMatch
-10	noColMatch	from Color2Index/ITabMatch
-11	qAllocErr	from MakeITable
-12	tblAllocErr	from MakeITable
-13	overRun	from MakeITable
-14	noRoomErr	from MakeITable
-15	seOutOfRange	from SetEntry
-16	seProtErr	from SetEntry
-17	i2CRangeErr	from SetEntry
-18	gdBadDev	from SetEntry
-19	reRangeErr	from SetEntry
-20	seInvRequest	from SetEntry
-21	seNoMemErr	from SetEntry

I/O System Errors

-17	controlErr	Driver can't respond to Control call
-18	statusErr	Driver can't respond to Status call
-19	readErr	Driver can't respond to Read call
-20	writErr	Driver can't respond to Write call
-21	badUnitErr	Driver ref num doesn't match unit table
-22	unitEmptyErr	Driver ref num specifies NIL handle in unit table
-23	openErr	Requested read/write permission doesn't match driver's open permission, or Attempt to open RAM serial Driver failed
-24	closErr	Close failed; Permission to close .MPP driver was denied
-25	dRemovErr	tried to remove an open driver
-26	dInstErr	DrvrInstall couldn't find driver in resources
-27	abortErr	IO call aborted by KillIO; Publisher has written a new edition *OR*
-27	iIOAbortErr	IO abort error (Printing Manager)
-28	notOpenErr	Couldn't rd/wr/ctl/sts cause driver not opened
-29	unitTblFullErr	Unit table has no more entries
-30	dceExtErr	dce extension error

File System Errors

-33	dirFulErr	Directory full
-34	dskFulErr	Disk full
-35	nsvErr	No such volume; volume not found
-36	ioErr	I/O error (bummers)
-37	bdNamErr	Bad file name; there may be no bad names in the final system!
-38	fnOpnErr	File not open
-39	eofErr	End of file; no additional data in the format
-40	posErr	Tried to position to before start of file (r/w)
-41	mFulErr	Memory full (open) or file won't fit (load)
-42	tmfoErr	too many files open
-43	fnfErr	File not found; Folder not found; Edition container not found; Target not found
-44	wPrErr	Diskette is write protected; Volume is locked through hardware
-45	fLckdErr	File is locked
-45	fLckedErr	Publisher writing to an edition
-46	vLckdErr	Volume is locked through software
-47	fBsyErr	File is busy (delete); Section doing I/O
-48	dupFNErr	Duplicate filename (rename); File found instead of folder
-49	opWrErr	File already open with with write permission
-50	paramErr	Error in user parameter list
-51	rfNumErr	Reference number invalid
-52	gfpErr	Get file position error
-53	volOffLinErr	Volume is off line
-54	permErr	Software lock on file; Not a subscriber [permissions error on file open]
-55	volOnLinErr	drive volume already on-line at MountVol
-56	nsDrvErr	no such drive (tried to mount a bad drive num)
-57	noMacDskErr	not a mac diskette (sig bytes are wrong)
-58	extFSErr	External file system - file system identifier is nonzero
-59	fsRnErr	file system internal error: during rename the old entry was deleted but could not be restored
-60	badMDBErr	bad master directory block
-61	wrPermErr	Write permissions error; Not a publisher

Font Manager Errors

-64	fontDecError	error during font declaration
-65	fontNotDeclared	font not declared
-66	fontSubErr	font substitution occured

Disk, Serial Ports, Clock Specific Errors

-64	lastDskErr	
-64	noDriveErr	drive not installed
-65	offLinErr	r/w requested for an off-line drive
-66	noNybErr	couldn't find 5 nybbles in 200 tries
-67	noAdrMkErr	couldn't find valid addr mark
-68	dataVerErr	read verify compare failed
-69	badCksmErr	addr mark checksum didn't check
-70	badBtSlpErr	bad addr mark bit slip nibbles
-71	noDtaMkErr	couldn't find a data mark header
-72	badDCksum	bad data mark checksum
-73	badDBtSlp	bad data mark bit slip nibbles
-74	wrUnderrun	write underrun occurred
-75	cantStepErr	step handshake failed
-76	tk0BadErr	track 0 detect doesn't change
-77	initIWMErr	unable to initialize IWM
-78	twoSideErr	tried to read 2nd side on a 1-sided drive
-79	spdAdjErr	unable to correctly adjust disk speed
-80	seekErr	track number wrong on address mark
-81	sectNFErr	sector number never found on a track
-82	fmt1Err	can't find sector 0 after track format
-83	fmt2Err	can't get enough sync
-84	verErr	track failed to verify
-84	firstDskErr	
-85	clkRdErr	unable to read same clock value twice
-86	clkWrErr	time written did not verify
-87	prWrErr	parameter ram written didn't read-verify
-88	prInitErr	InitUtil found the parameter ram uninitialized
-89	rcvrErr	SCC receiver error (framing, parity, OR)
-90	breakRecd	Break received (SCC)

AppleTalk Errors

-91	ddpSktErr	Error opening socket *OR*
-91	eMultiErr	Invalid address or table is full
-92	ddpLenErr	Data length too big *OR*
-92	eLenErr	Packet too large or first entry of the write-data structure did not contain the full 14-byte header
-93	noBridgeErr	No router available [for non-local send]

-94	lapProtErr	error in attaching/detaching protocol *OR*
-94	LAPProtErr	Protocol handler is already attached, node's protocol table is full, protocol not attached, or protocol handler pointer was not 0
-95	excessCollsns	Hardware error [excessive collisions on write]
-97	portInUse	driver Open error code (port is in use)
-98	portNotCf	driver Open error code (parameter RAM not configured for this connection)
-99	memROZErr	hard error in ROZ
-99	memROZError	hard error in ROZ
-99	memROZWarn	soft error in ROZ

Scrap Manager Errors

-100	noScrapErr	No scrap exists error
-102	noTypeErr	Format not available [no object of that type in scrap]

Storage Allocator Errors

-108	memFullErr	Ran out of memory [not enough room in heap zone]
-109	nilHandleErr	GetHandleSize fails on baseText or substitutionText; NIL master pointer [handle was NIL in HandleZone or other]
-110	memAdrErr	Address was odd, or out of range
-111	memWZErr	Attempted to operate on a free block; GetHandleSize fails on baseText or substitutionText [WhichZone failed (applied to free block)]
-112	memPurErr	Trying to purge a locked or non-purgeable block
-113	memAZErr	Address in zone check failed
-114	memPCErr	Pointer Check failed
-115	memBCErr	Block Check failed
-116	memSCErr	Size Check failed
-117	memLockedErr	Trying to move a locked block (MoveHHi)

HFS Errors

-120	dirNFErr	Directory not found
-121	tmwdoErr	No free WDCB available
-122	badMovErr	Move into offspring error
-123	wrgVolTypErr	Not an HFS volume [wrong volume type error or (obsolete) operation not supported for MFS]
-124	volGoneErr	Server volume has been disconnected.
-125	updPixMemErr	Insufficient memory to update a pixmap
-127	fsDSIntErr	Internal file system error

Menu Manager Errors

-126	dsMBarNFnd	System error code for MBDF not found
-127	dsHMenuFindErr	Could not find HMenu's parent in MenuKey
-128	userCanceledErr	User canceled an operation

HFS FileID Errors

-130	fidNotFound	no file thread exists
-131	fidNotAFile	directory specified
-132	fidExists	file id already exists

Color Quickdraw & Color Manager Errors

-147	regionTooBigError	Region too big or complex
-148	pixMapTooBigErr	Pixel map record is deeper than 1 bit per pixel [passed pixelmap is too large]
-149	notEnoughStack	Not enough stack space for the necessary buffers *OR*
-149	mfStackErr	Insufficient stack
-150	cMatchErr	Color2Index failed to find an index
-151	cTempMemErr	Failed to allocate memory for temporary structures
-152	cNoMemErr	Failed to allocate memory for structure
-153	cRangeErr	Range error on colorTable request
-154	cProtectErr	ColorTable entry protection violation
-155	cDevErr	Invalid type of graphics device
-156	cResErr	Invalid resolution for MakeITable
-157	cDepthErr	Invalid pixel depth
-158	cParmErr	Invalid parameter

Resource Manager Errors (other than I/O)

-185	badExtResource	Extended resource has a bad format.
-186	CantDecompress	Resource bent ("the bends") can't decompress a compressed resource
-188	resourceInMemory	Resource already in memory
-189	writingPastEnd	Writing past end of file
-190	inputOutOfBounds	Offset or count out of bounds
-192	resNotFound	Resource not found
-193	resFNotFound	Resource file not found
-194	addResFailed	AddResource failed
-195	addRefFailed	AddReference failed

-196	rmvResFailed	RmveResource failed
-197	rmvRefFailed	RmveReference failed
-198	resAttrErr	Attribute inconsistent with operation
-199	mapReadErr	Map inconsistent with operation

Sound Manager Errors

-200	noHardware	Required sound hardware not available [no hardware support for the specified synthesizer]
-201	notEnoughHardware	Insufficient hardware available [no more channels for the specified synthesizer]
-203	queueFull	No room in the queue
-204	resProblem	Problem loading the resource
-205	badChannel	Channel is corrupt or unusable [invalid channel queue length]
-206	badFormat	Resource is corrupt or unusable [handle to 'snd ' resource was invalid]
-207	notEnoughBufferSpace	Insufficient memory available
-208	badFileFormat	File is corrupt or unusable, or not AIFF or AIFF-C
-209	channel	Channel is busy
-210	buffersTooSmall	Buffer is too small
-211	channelNotBusy	Channel not currently used
-212	noMoreRealTime	Not enough CPU time available
-213	badParam	A parameter is incorrect
-220	siNoSoundInHardware	No sound input hardware available
-221	siBadSoundInDevice	Invalid sound input device
-222	siNoBufferSpecified	No buffer specified
-223	siInvalidCompression	Invalid compression type
-224	siHardDiskTooSlow	Hard drive too slow to record
-225	siInvalidSampleRate	Invalid sample rate
-226	siInvalidSampleSize	Invalid sample size
-227	siDeviceBusyErr	Sound input device is busy
-228	siBadDeviceName	Invalid device name
-229	siBadRefNum	Invalid reference number
-230	siInputDeviceErr	Input device hardware failure
-231	siUnknownInfoType	Unknown type of information
-232	siUnknownQuality	Unknown quality

MIDI Manager Errors

-250	midiNoClientErr	no client with that ID found
-251	midiNoPortErr	no port with that ID found
-252	midiTooManyPortsErr	too many ports already installed in the system
-253	midiTooManyConsErr	too many connections made
-254	midiVConnectErr	pending virtual connection created
-255	midiVConnectMade	pending virtual connection resolved
-256	midiVConnectRmvd	pending virtual connection removed
-257	midiNoConErr	no connection exists between specified ports
-258	midiWriteErr	couldn't write to all connected ports
-259	midiNameLenErr	name supplied is longer than 31 characters
-260	midiDupIDErr	duplicate client ID
-261	midiInvalidCmdErr	command not supported for port type

System Errors 7.0.1: Negative Codes (0 to -261)

Revised: 9/25/92
Security: Everyone

System Errors 7.0.1: Negative Codes (0 to -261)

==========

Article Created: 31 January 1992

Article Change History

09/25/92 - REVIEWED
- For technical accuracy.

TOPIC ----------

The following list provides an explanation of system errors 0 to -261 as it relates to system software version 7.0.1.

Here's an explanation of two symbols used in the lists:

[Items listed in brackets are old result code meanings]

???? This information wasn't available.

DISCUSSION ----------

General System Errors (VBL Mgr, Queue, Etc.)

0	noErr	0 for success *OR*
0	smNotTruncated	No truncation necessary
-1	qErr	queue element not found during deletion *OR*
-1	smTruncErr	Truncation indicator alone is wider than the specified width
-2	vTypErr	invalid queue element
-3	corErr	core routine number out of range
-4	unimpErr	unimplemented core routine
-5	SlpTypeErr	invalid queue element
-8	seNoDB	no debugger installed to handle debugger command

Color Manager Errors

-9	iTabPurgErr	from Color2Index/ITabMatch

```
-10   noColMatch       from Color2Index/ITabMatch
-11   qAllocErr        from MakeITable
-12   tblAllocErr      from MakeITable
-13   overRun          from MakeITable
-14   noRoomErr        from MakeITable
-15   seOutOfRange     from SetEntry
-16   seProtErr        from SetEntry
-17   i2CRangeErr      from SetEntry
-18   gdBadDev         from SetEntry
-19   reRangeErr       from SetEntry
-20   seInvRequest     from SetEntry
-21   seNoMemErr       from SetEntry

I/O System Errors
-17   controlErr       Driver can't respond to Control call
-18   statusErr        Driver can't respond to Status call
-19   readErr          Driver can't respond to Read call
-20   writErr          Driver can't respond to Write call
-21   badUnitErr       Driver ref num doesn't match unit table
-22   unitEmptyErr     Driver ref num specifies NIL handle in unit table
-23   openErr          Requested read/write permission doesn't match
                       driver's open permission, or
                       Attempt to open RAM serial Driver failed
-24   closErr          Close failed; Permission to close .MPP driver
                       was denied
-25   dRemovErr        tried to remove an open driver
-26   dInstErr         DrvrInstall couldn't find driver in resources
-27   abortErr         IO call aborted by KillIO; Publisher has written
                       a new edition *OR*
-27   iIOAbortErr      IO abort error (Printing Manager)
-28   notOpenErr       Couldn't rd/wr/ctl/sts cause driver not opened
-29   unitTblFullErr   Unit table has no more entries
-30   dceExtErr        dce extension error

File System Errors
-33   dirFulErr        Directory full
-34   dskFulErr        Disk full
-35   nsvErr           No such volume; volume not found
-36   ioErr            I/O error (bummers)
-37   bdNamErr         Bad file name; there may be no bad names
                       in the final system!
-38   fnOpnErr         File not open
-39   eofErr           End of file; no additional data in the format
-40   posErr           Tried to position to before start of file (r/w)
-41   mFulErr          Memory full (open) or file won't fit (load)
-42   tmfoErr          too many files open
-43   fnfErr           File not found; Folder not found;
                       Edition container not found; Target not found
-44   wPrErr           Diskette is write protected; Volume is locked
                       through hardware
-45   fLckdErr         File is locked
-45   fLckedErr        Publisher writing to an edition
-46   vLckdErr         Volume is locked through software
```

-47	fBsyErr	File is busy (delete); Section doing I/O
-48	dupFNErr	Duplicate filename (rename); File found instead of folder
-49	opWrErr	File already open with with write permission
-50	paramErr	Error in user parameter list
-51	rfNumErr	Reference number invalid
-52	gfpErr	Get file position error
-53	volOffLinErr	Volume is off line
-54	permErr	Software lock on file; Not a subscriber [permissions error on file open]
-55	volOnLinErr	drive volume already on-line at MountVol
-56	nsDrvErr	no such drive (tried to mount a bad drive num)
-57	noMacDskErr	not a mac diskette (sig bytes are wrong)
-58	extFSErr	External file system — file system identifier is nonzero
-59	fsRnErr	file system internal error: during rename the old entry was deleted but could not be restored…
-60	badMDBErr	bad master directory block
-61	wrPermErr	Write permissions error; Not a publisher

Font Manager Errors

-64	fontDecError	error during font declaration
-65	fontNotDeclared	font not declared
-66	fontSubErr	font substitution occured

Disk, Serial Ports, Clock Specific Errors

-64	lastDskErr	
-64	noDriveErr	drive not installed
-65	offLinErr	r/w requested for an off-line drive
-66	noNybErr	couldn't find 5 nybbles in 200 tries
-67	noAdrMkErr	couldn't find valid addr mark
-68	dataVerErr	read verify compare failed
-69	badCksmErr	addr mark checksum didn't check
-70	badBtSlpErr	bad addr mark bit slip nibbles
-71	noDtaMkErr	couldn't find a data mark header
-72	badDCksum	bad data mark checksum
-73	badDBtSlp	bad data mark bit slip nibbles
-74	wrUnderrun	write underrun occurred
-75	cantStepErr	step handshake failed
-76	tk0BadErr	track 0 detect doesn't change
-77	initIWMErr	unable to initialize IWM
-78	twoSideErr	tried to read 2nd side on a 1-sided drive
-79	spdAdjErr	unable to correctly adjust disk speed
-80	seekErr	track number wrong on address mark
-81	sectNFErr	sector number never found on a track
-82	fmt1Err	can't find sector 0 after track format
-83	fmt2Err	can't get enough sync
-84	verErr	track failed to verify
-84	firstDskErr	
-85	clkRdErr	unable to read same clock value twice
-86	clkWrErr	time written did not verify
-87	prWrErr	parameter ram written didn't read-verify
-88	prInitErr	InitUtil found the parameter ram uninitialized

-89	rcvrErr	SCC receiver error (framing, parity, OR)
-90	breakRecd	Break received (SCC)

AppleTalk Errors

-91	ddpSktErr	Error opening socket *OR*
-91	eMultiErr	Invalid address or table is full
-92	ddpLenErr	Data length too big *OR*
-92	eLenErr	Packet too large or first entry of the write-data structure did not contain the full 14-byte header
-93	noBridgeErr	No router available [for non-local send]
-94	lapProtErr	error in attaching/detaching protocol *OR*
-94	LAPProtErr	Protocol handler is already attached, node's protocol table is full, protocol not attached, or protocol handler pointer was not 0
-95	excessCollsns	Hardware error [excessive collisions on write]
-97	portInUse	driver Open error code (port is in use)
-98	portNotCf	driver Open error code (parameter RAM not configured for this connection)
-99	memROZErr	hard error in ROZ
-99	memROZError	hard error in ROZ
-99	memROZWarn	soft error in ROZ

Scrap Manager Errors

-100	noScrapErr	No scrap exists error
-102	noTypeErr	Format not available [no object of that type in scrap]

Storage Allocator Errors

-108	memFullErr	Ran out of memory [not enough room in heap zone]
-109	nilHandleErr	GetHandleSize fails on baseText or substitutionText; NIL master pointer [handle was NIL in HandleZone or other]
-110	memAdrErr	Address was odd, or out of range
-111	memWZErr	Attempted to operate on a free block; GetHandleSize fails on baseText or substitutionText [WhichZone failed (applied to free block)]
-112	memPurErr	Trying to purge a locked or non-purgeable block
-113	memAZErr	Address in zone check failed
-114	memPCErr	Pointer Check failed
-115	memBCErr	Block Check failed
-116	memSCErr	Size Check failed
-117	memLockedErr	Trying to move a locked block (MoveHHi)

HFS Errors

-120	dirNFErr	Directory not found
-121	tmwdoErr	No free WDCB available
-122	badMovErr	Move into offspring error
-123	wrgVolTypErr	Not an HFS volume [wrong volume type error or (obsolete) operation not supported for MFS]
-124	volGoneErr	Server volume has been disconnected.
-125	updPixMemErr	Insufficient memory to update a pixmap
-127	fsDSIntErr	Internal file system error

```
Menu Manager Errors
-126  dsMBarNFnd      System error code for MBDF not found
-127  dsHMenuFindErr  Could not find HMenu's parent in MenuKey
-128  userCanceledErr User canceled an operation

HFS FileID Errors
-130  fidNotFound     no file thread exists
-131  fidNotAFile     directory specified
-132  fidExists       file id already exists

Color Quickdraw & Color Manager Errors
-147  regionTooBigError  Region too big or complex
-148  pixMapTooBigErr    Pixel map record is deeper than 1 bit per pixel
                         [passed pixelmap is too large]
-149  notEnoughStack  Not enough stack space for the necessary buffers *OR*
-149  mfStackErr      Insufficient stack
-150  cMatchErr       Color2Index failed to find an index
-151  cTempMemErr     Failed to allocate memory for temporary structures
-152  cNoMemErr       Failed to allocate memory for structure
-153  cRangeErr       Range error on colorTable request
-154  cProtectErr     ColorTable entry protection violation
-155  cDevErr         Invalid type of graphics device
-156  cResErr         Invalid resolution for MakeITable
-157  cDepthErr       Invalid pixel depth
-158  cParmErr        Invalid parameter

Resource Manager Errors (other than I/O)
-185  badExtResource   Extended resource has a bad format.
-186  CantDecompress   Resource bent ("the bends")
                       can't decompress a compressed resource
-188  resourceInMemory Resource already in memory
-189  writingPastEnd   Writing past end of file
-190  inputOutOfBounds Offset or count out of bounds

-192  resNotFound      Resource not found
-193  resFNotFound     Resource file not found
-194  addResFailed     AddResource failed
-195  addRefFailed     AddReference failed
-196  rmvResFailed     RmveResource failed
-197  rmvRefFailed     RmveReference failed
-198  resAttrErr       Attribute inconsistent with operation
-199  mapReadErr       Map inconsistent with operation

Sound Manager Errors
-200  noHardware        Required sound hardware not available
                       [no hardware support for the specified synthesizer]
-201  notEnoughHardware Insufficient hardware available
                       [no more channels for the specified synthesizer]
-203  queueFull         No room in the queue
-204  resProblem        Problem loading the resource
-205  badChannel        Channel is corrupt or unusable
                       [invalid channel queue length]
-206  badFormat         Resource is corrupt or unusable
```

```
                        [handle to 'snd ' resource was invalid]
-207  notEnoughBufferSpace  Insufficient memory available
-208  badFileFormat     File is corrupt or unusable, or not AIFF or AIFF-C
-209  channel           Channel is busy
-210  buffersTooSmall   Buffer is too small
-211  channelNotBusy    Channel not currently used
-212  noMoreRealTime    Not enough CPU time available
-213  badParam          A parameter is incorrect
-220  siNoSoundInHardware   No sound input hardware available
-221  siBadSoundInDevice    Invalid sound input device
-222  siNoBufferSpecified   No buffer specified
-223  siInvalidCompression  Invalid compression type
-224  siHardDiskTooSlow     Hard drive too slow to record
-225  siInvalidSampleRate   Invalid sample rate
-226  siInvalidSampleSize   Invalid sample size
-227  siDeviceBusyErr       Sound input device is busy
-228  siBadDeviceName       Invalid device name
-229  siBadRefNum           Invalid reference number
-230  siInputDeviceErr      Input device hardware failure
-231  siUnknownInfoType     Unknown type of information
-232  siUnknownQuality      Unknown quality

MIDI Manager Errors
-250  midiNoClientErr     no client with that ID found
-251  midiNoPortErr       no port with that ID found
-252  midiTooManyPortsErr too many ports already installed in the system
-253  midiTooManyConsErr  too many connections made
-254  midiVConnectErr     pending virtual connection created
-255  midiVConnectMade    pending virtual connection resolved
-256  midiVConnectRmvd    pending virtual connection removed
-257  midiNoConErr        no connection exists between specified ports
-258  midiWriteErr        couldn't write to all connected ports
-259  midiNameLenErr      name supplied is longer than 31 characters
-260  midiDupIDErr        duplicate client ID
-261  midiInvalidCmdErr   command not supported for port type
```

TITLE

Mac OS System Error Codes: 1 to 32767

Article ID: 9806
Created: 2/25/92
Modified: 5/19/99

TOPIC

These lists of system error codes and their meanings are maintained with MPW SysErr.a, and in Inside Macintosh Volume VI (c) Addison-Wesley 1991.

DISCUSSION

Note: Items listed in [brackets] are old result code meanings.

DS Error Table

1	dsBusError	bus error
2	dsAddressErr	address error
3	dsIllInstErr	illegal instruction error
4	dsZeroDivErr	zero divide error
5	dsChkErr	check trap error
6	dsOvflowErr	overflow trap error
7	dsPrivErr	privilege violation error
8	dsTraceErr	trace mode error
9	dsLineAErr	line 1010 trap error
10	dsLineFErr	line 1111 trap error
11	dsMiscErr	miscellaneous hardware exception error
12	dsCoreErr	unimplemented core routine error
13	dsIrqErr	uninstalled interrupt error
14	dsIOCoreErr	IO Core Error
15	dsLoadErr	Segment Loader Error
16	dsFPErr	Floating point error
17	dsNoPackErr	package 0 not present [List Manager]
18	dsNoPk1	package 1 not present [Reserved by Apple]
19	dsNoPk2	package 2 not present [Disk Initialization]
20	dsNoPk3	package 3 not present [Standard File]
21	dsNoPk4	package 4 not present [Floating-Point Arithmetic]
22	dsNoPk5	package 5 not present [Transcendental Functions]
23	dsNoPk6	package 6 not present [International Utilities]
24	dsNoPk7	package 7 not present [Binary/Decimal Conversion]
25	dsMemFullErr	out of memory!
26	dsBadLaunch	can't launch file
27	dsFSErr	file system map has been trashed
28	dsStknHeap	stack has moved into application heap
30	dsReinsert	request user to reinsert off-line volume
31	dsNotThe1	not the disk I wanted (obsolete)
33	negZcbFreeErr	ZcbFree has gone negative
40	dsGreeting	welcome to Macintosh greeting
41	dsFinderErr	can't load the Finder error
42	shutDownAlert	handled like a shutdown error (obsolete)
43	dsSystemFileErr	can't find System file to open (obsolete)
51	dsBadSlotInt	unserviceable slot interrupt
81	dsBadSANEopcode	bad opcode given to SANE Pack4
84	menuPrgErr	happens when a menu is purged
85	dsMBarNFnd	SysErr -- cannot find MBDF
86	dsHMenuFindErr	SysErr -- recursively defined HMenus
87	dsWDEFnFnd	Could not load WDEF
88	dsCDEFnFnd	Could not load CDEF
89	dsMDEFnFnd	Could not load MDEF
98	dsNoPatch	Can't patch for particular Model Mac
99	dsBadPatch	Can't load patch resource
101	dsParityErr	memory parity error
102	dsOldSystem	System is too old for this ROM
103	ds32BitMode	booting in 32-bit on a 24-bit sys

```
20000 dsShutDownOrRestart   user choice between ShutDown and Restart
20001 dsSwitchOffOrRestart  user choice between switching off and Restart
20002 dsForcedQuit    allow the user to ExitToShell, return if Cancel
32767 dsSysErr        general system error (catch-all used in DSAT)
```

System Errors 7.0.1: Positive Codes (1 to 32767)

Revised: 9/25/92
Security: Everyone

System Errors 7.0.1: Positive Codes (1 to 32767)

==========

Article Created: 31 January 1992

Article Change History

09/25/92 - REVIEWED
- For technical accuracy.

TOPIC ----------

These lists of system error codes and their meanings are maintained with MPW SysErr.a, and in Inside Macintosh Volume VI (c) Addison-Wesley 1991. The last change was for system software version 7.0.1, on Thursday, June 20, 1991.

Here's an explanation of two symbols used in the lists:

[Items listed in brackets are old result code meanings]

???? This information wasn't available.

DISCUSSION ----------

DS Error Table

1	dsBusError	bus error
2	dsAddressErr	address error
3	dsIllInstErr	illegal instruction error
4	dsZeroDivErr	zero divide error
5	dsChkErr	check trap error
6	dsOvflowErr	overflow trap error
7	dsPrivErr	privilege violation error
8	dsTraceErr	trace mode error
9	dsLineAErr	line 1010 trap error
10	dsLineFErr	line 1111 trap error

TITLE

Mac OS System Error Codes: Uncommon Codes

Article ID: 9808
Created: 2/25/92
Modified: 5/20/99

TOPIC

The following list provides an explanation of uncommon system errors. These lists are maintained with SysErr.a and in the Inside Macintosh programmer's documentation.

DISCUSSION

Note: Items listed in [brackets] are old result code meanings.
Note: ???? This information wasn't available.

```
Internal File System Errors
1     chNoBuf         no free cache buffers (all in use)
2     chInUse         requested block in use
3     chnotfound      requested block not found
4     chNotInUse      block being released was not in use
16    fxRangeErr      file position beyond mapped range
17    fxOvFlErr     extents file overflow
32    btnotfound    record not found
33    btexists      record already exists
34    btnospace     no available space
35    btnoFit       record doesn't fit in node
36    btbadNode     bad node detected
37    btbadHdr      bad BTree header record detected
48    cmnotfound    CNode not found
49    cmexists      CNode already exists
50    cmnotempty    directory CNode not empty (valence = 0)
51    cmRootCN      invalid reference to root CNode
52    cmbadnews     detected bad catalog structure
53    cmFThdDirErr thread belongs to a directory not a file
54    cmFThdGone    file thread doesn't exist
64    dsBadRotate   bad BTree rotate

Slot Declaration ROM Manager Errors
1     siInitSDTblErr  slot int dispatch table could not be initialized.
2     siInitVBLQsErr  VBLqueues for all slots could not be initialized.
3     siInitSPTblErr  slot priority table could not be initialized.
10    sdmJTInitErr    SDM Jump Table could not be initialized.
11    sdmInitErr      SDM could not be initialized.
12    sdmSRTInitErr   Slot Resource Table could not be initialized.
13    sdmPRAMInitErr  Slot PRAM could not be initialized.
14    sdmPriInitErr   Cards could not be initialized.

HD20 Driver Errors
16    wrtHsLw         HSHK low before starting
17    wrtHSLwTO       Time out waiting for HSHK to go low
19    wrtHSHighTO     Time out waiting for HSHK to go high
32    rdHsHi          HSHK high before starting
33    rdSyncTO        Time out waiting for sync ($AA) bye
34    rdGroupTO       Time out waiting for group
36    rdHoffSyncTO    Time out waiting for sync after holdoff
37    rdHsHiTO        Time out waiting for HSHK high
38    rdChksumErr     Checksum error on response packet
48    invalidResp     First byte in response packet was wrong
49    sqncNumErr      Sequence number in response packet was wrong
50    dNumberErr      Drive number in response packet was wrong
64    noResp          No response packet ever received

SCSI Manager Errors
```

```
2     scCommErr       Communications error (operations timeout)
3     scArbNBErr      Arbitration failed during SCSIGet - Bus busy
4     scBadparmsErr   Bad parameter or TIB opcode
5     scPhaseErr      SCSI bus not in correct phase for operation
6     scCompareErr    SCSI Manager busy with another operation when
                      SCSIGet was called
7     scMgrBusyErr    SCSI Manager busy with another operation when
                      SCSIGet was called
8     scSequenceErr   Attempted operation is out of sequence - e.g.,
                      calling SCSISelect before doing SCSIGet
9     scBusTOErr      Bus timeout before data ready on SCSIRBlind and
                      SCSIWBlind
10    scComplPhaseErr SCSIComplete failed - bus not in Status phase

Serial Driver Error Masks
1     swOverrunErr    Serial Driver overrun error
16    parityErr       Serial parity error
32    hwOverrunErr    Serial hardware overrun
64    framingErr      Serial framing error

Miscellaneous Result Code
1     evtNotEnb       Event not enabled at PostEvent

CDev Errors
0     cdevMemErr      Memory shortfall; alert user please
1     cdevResErr      Couldn't get a needed resource; alert
3     cdevUnset       cdevValue is initialized to this
-1    cdevGenErr      General error; gray cdev w/o alert

Script Manager Errors
0     smNotTruncated  No truncation was necessary
1     smTruncated     Truncation performed
-1    smTruncErr      General error

Communications Toolbox Errors
0     ctbuNoErr        ????
-1    ctbuGenericError ????

Communications Resource Manager Errors
0     crmNoErr        ????
-1    crmGenericError ????

Connection Manager Errors
0     cmNoErr            ????
1     cmRejected         ????
2     cmFailed           ????
3     cmTimeOut          ????
4     cmNotOpen          ????
5     cmNotClosed        ????
6     cmNoRequestPending ????
7     cmNotSupported     ????
8     cmNoTools          ????
9     cmUserCancel       ????
11    cmUnknownError     ????
-1    cmGenericError     ????

File Transfer Manager Errors
0     ftNoErr           ????
1     ftRejected        ????
2     ftFailed          ????
3     ftTimeOut         ????
4     ftTooManyRetry    ????
5     ftNotEnoughDSpace ????
6     ftRemoteCancel    ????
7     ftWrongFormat     ????
8     ftNoTools         ????
9     ftUserCancel      ????
10    ftNotSupported    ????
11    ftUnknownError    ????
-1    ftGenericError    ????

Midi Manager MIDIPacket Errors
1     midiOverflowErr ????
2     midiSCCErr      ????
3     midiPacketErr   ????

System Errors 7.0.1: Uncommon Codes

Revised: 9/25/92
Security: Everyone

System Errors 7.0.1: Uncommon Codes

==========

Article Created: 31 January 1992

Article Change History

09/25/92 - REVIEWED
- For technical accuracy.

TOPIC ----------

These lists are maintained with MPW SysErr.a and in Inside Macintosh Volume VI (c) Addison-Wesley 1991. The last change was for system software version 7.0.1, on Thursday, June 20, 1991.

Here's an explanation of two symbols used in the lists:

[Items listed in brackets are old result code meanings]

???? This information wasn't available.

DISCUSSION ----------

Internal File System Errors

1	chNoBuf	no free cache buffers (all in use)
2	chInUse	requested block in use
3	chnotfound	requested block not found
4	chNotInUse	block being released was not in use
16	fxRangeErr	file position beyond mapped range
17	fxOvFlErr	extents file overflow
32	btnotfound	record not found
33	btexists	record already exists
34	btnospace	no available space
35	btnoFit	record doesn't fit in node
36	btbadNode	bad node detected
37	btbadHdr	bad BTree header record detected

48	cmnotfound	CNode not found
49	cmexists	CNode already exists
50	cmnotempty	directory CNode not empty (valence = 0)
51	cmRootCN	invalid reference to root CNode
52	cmbadnews	detected bad catalog structure
53	cmFThdDirErr	thread belongs to a directory not a file
54	cmFThdGone	file thread doesn't exist
64	dsBadRotate	bad BTree rotate

Slot Declaration ROM Manager Errors

1	siInitSDTblErr	slot int dispatch table could not be initialized.
2	siInitVBLQsErr	VBLqueues for all slots could not be initialized.
3	siInitSPTblErr	slot priority table could not be initialized.
10	sdmJTInitErr	SDM Jump Table could not be initialized.
11	sdmInitErr	SDM could not be initialized.
12	sdmSRTInitErr	Slot Resource Table could not be initialized.
13	sdmPRAMInitErr	Slot PRAM could not be initialized.
14	sdmPriInitErr	Cards could not be initialized.

HD20 Driver Errors

16	wrtHsLw	HSHK low before starting
17	wrtHSLwTO	Time out waiting for HSHK to go low
19	wrtHSHighTO	Time out waiting for HSHK to go high
32	rdHsHi	HSHK high before starting
33	rdSyncTO	Time out waiting for sync ($AA) bye
34	rdGroupTO	Time out waiting for group
36	rdHoffSyncTO	Time out waiting for sync after holdoff
37	rdHsHiTO	Time out waiting for HSHK high
38	rdChksumErr	Checksum error on response packet
48	invalidResp	First byte in response packet was wrong
49	sqncNumErr	Sequence number in response packet was wrong
50	dNumberErr	Drive number in response packet was wrong
64	noResp	No response packet ever received

SCSI Manager Errors

2	scCommErr	Communications error (operations timeout)
3	scArbNBErr	Arbitration failed during SCSIGet – Bus busy
4	scBadparmsErr	Bad parameter or TIB opcode
5	scPhaseErr	SCSI bus not in correct phase for operation
6	scCompareErr	SCSI Manager busy with another operation when SCSIGet was called
7	scMgrBusyErr	SCSI Manager busy with another operation when SCSIGet was called
8	scSequenceErr	Attempted operation is out of sequence – e.g., calling SCSISelect before doing SCSIGet
9	scBusTOErr	Bus timeout before data ready on SCSIRBlind and SCSIWBlind
10	scComplPhaseErr	SCSIComplete failed – bus not in Status phase

Serial Driver Error Masks

1	swOverrunErr	Serial Driver overrun error
16	parityErr	Serial parity error

```
32    hwOverrunErr    Serial hardware overrun
64    framingErr      Serial framing error

Miscellaneous Result Code
1     evtNotEnb       Event not enabled at PostEvent

CDev Errors
0     cdevMemErr      Memory shortfall; alert user please
1     cdevResErr      Couldn't get a needed resource; alert
3     cdevUnset       cdevValue is initialized to this
-1    cdevGenErr      General error; gray cdev w/o alert

Script Manager Errors
0     smNotTruncated  No truncation was necessary
1     smTruncated     Truncation performed
-1    smTruncErr      General error

A/UX 3.0: Support for QuickTime

==========

Article Created: 8 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Does A/UX 3.0 support QuickTime?

DISCUSSION -----

Yes, A/UX 3.0 supports QuickTime. A/UX 3.0 fully integrates QuickTime into the Macintosh environment running under UNIX. This is one of the first UNIX-based systems that integrates dynamic data such as sound, video, and animation into documents.

QuickTime: Creating and Distributing Movies

Revised: 3/19/92
Security: Everyone

QuickTime: Creating and Distributing Movies

==========

Article Created: 8 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

How do I create and distribute QuickTime movies?

DISCUSSION ----------

You can create QuickTime animation movies by saving your animation as a QuickTime Movie from a wide variety of upgraded QuickTime-savvy applications. A utility in the QuickTime Starter Kit will also let you convert appropriate Macintosh and DOS file formats to QuickTime movies. Utilities in the Movie Exchange Toolkit will also let you convert content on other platforms to QuickTime movies.

If you want to create a video QuickTime movie, the easiest way is by using one of the new QuickTime digitizer cards, such as VideoSpigot from SuperMac. For higher-quality capture, there are several tools in the QuickTime Developer's Kit, that allow for controlled capture from laserdiscs and professional video equipment.

A QuickTime movie is just a regular Macintosh file -- you can distribute it as you would any ordinary Macintosh file. But because QuickTime movies are typically large, you'll usually use storage media such as CD-ROM, removable mass storage, or networks. You can also record your presentations, including QuickTime movies, to videotape using any number of third-party RGB-to-NTSC/PAL hardware solutions.

Security: Everyone

QuickTime: System Requirements and Installation 2/93

==========

Article Created: 8 February 1992

Article Change History

06/29/92 - REVIEWED
- For technical accuracy.

12/22/92 - REVISED
- To add more detail about 32-bit QuickDraw and using it on different system configurations.

02/03/93 - REVISED
- To add note about QuickTime Starter Kit installation.

TOPIC ---

What are the system requirements for QuickTime, and what else do I need to do before installing it? Will it work with a SCSI-based graphics adapter?

DISCUSSION ---

QuickTime requires a Macintosh computer with a 68020 or later microprocessor, with system software version 6.0.7 or later. Apple recommends at least 4MB of memory when using QuickTime with System 7. QuickTime relies on the capabilities of 32-bit QuickDraw, which only runs on 68020 or later Macintosh computers.

With System 6.0.7, the 32-Bit QuickDraw file is located on the Printing Tools disk in the Apple Color folder and isn't automatically installed. You must install it manually. With System 7 and later versions, 32-bit QuickDraw is built into the system software, and a separate file for 32-bit QuickDraw is no longer required.

If you want to use QuickTime on an older Macintosh, you might be able to upgrade the unit or use a third-party board to bring it up to a 68020 CPU or higher. QuickTime will then work with System 7 installed, or with the

32-bit QuickDraw file installed in system 6.0.5 or 6.0.7.

In regards to QuickDraw working on a SCSI-based graphic adapter, we don't have any testing information on its functionality with such a device. We have heard reports of these devices being significantly slower in the screen drawing process. Based on this information, we would expect QuickTime to have a very poor performance when compared to operation with direct video through a video board or built-in video.

To install, simply drag the QuickTime extension to your System Folder and restart. Please note that the Installer for QuickTime Starter Kit 1.0 will replace QuickTime version 1.5 with 1.0. Just reinstall the QuickTime 1.5 extension.

QuickTime: Movie Exchange Toolkit

Revised: 9/16/92
Security: Everyone

QuickTime: Movie Exchange Toolkit

==========

Article Created: 8 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC --

What is the QuickTime Movie Exchange Toolkit?

DISCUSSION --

This toolkit consists of utilities, sample code, and documentation to allow developers to incorporate the QuickTime Movie file format into their non-Macintosh applications. The utilities support popular models of computers running MS-DOS, Windows, Cray, Silicon Graphics, Sun, DEC, and IBM computers.

For example, a user creating an animation in MS-DOS will have the option of converting that animation to a QuickTime movie. The animation can then be shared with Macintosh users over a network or via floppy disk, but only played back on a Macintosh.

QuickTime: Video Window Size

Revised: 5/7/92
Security: Everyone

QuickTime: Video Window Size

==========

Article Created: 8 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Why is the video window so small?

DISCUSSION -----

There is no limit in QuickTime to the size or frame rate you can have for a movie -- the only limitation is hardware. On existing Macintosh computers, and using Apple's Video Compressor, you can run 160 x 120 pixel movies at an average of 15 frames per second. The new Macintosh Display Card 8•24 GC can provide larger video windows by decompressing the video from its AMD2900 RISC processor.

Article Last Updated:

TOPIC ----------

What are the bit depths with the Apple 16-Inch Color Display and the Macintosh Display Cards 8•24 and 8•24 GC?

What support do the Quadra 700 and 900 give the Apple 16-Inch Color Display with their various VRAM configurations?

DISCUSSION ----------

The Macintosh Display Cards 8•24, 8•24 GC, Quadra 700, and Quadra 900 offer the following support for the Apple 16-Inch Color Display:

8•24 (rev B) - 1, 2, 4, and 8 bits/pixel (up to 256 colors)

8•24 GC (rev B) - 1, 2, 4, 8, and 16 bits/pixel (up to 32,768 colors)

Quadra 700 - .5MB VRAM: 1, 2, 4, and 8 bits/pixel (up to 256 colors)
1MB VRAM: 1, 2, 4, and 8 bits/pixel (up to 256 colors)
2MB VRAM: 1, 2, 4, 8 and 24 bits/pixel (up to 16.7 colors)

Quadra 900 - 1MB VRAM: 1, 2, 4, and 8 bits/pixel (up to 256 colors)
2MB VRAM: 1, 2, 4, 8 and 24 bits/pixel (up to 16.7 colors)

AppleTalk Remote Access: Manual Dialing (1/96)

Revised: 1/29/96
Security: Everyone

AppleTalk Remote Access: Manual Dialing (1/96)

==========

Article Created: 6 February 1992
Article Reviewed/Updated: 29 January 1996

TOPIC ----------

I have a question about using a PowerBook 170 to communicate with a remote computer long distance. If I use a special discount phone service and have to talk to an operator to get access to the this line, when would I connect with the remote modem with Remote Access? Or can I even communicate using a phone service like this?

DISCUSSION ----------

Yes, it's possible to dial manually and still connect using AppleTalk Remote Access 1.0. The "Apple Modem 2400 with X1" Remote Access Script allows this. You can download this script from Apple's ARA Server at 512-908-8118 (connect as a Guest). Also, Apple Remote Access 2.0, the version with Dial Assist, has the ability to manually dial through the Setup Menu in the Apple Remote Access program. Upgrading to ARA 2.0 is probably easier than trying to modify the CCL script for your modem.

Background Information

The PowerBook Modem normally waits to detect a dial tone before dialing. When dialing manually it's necessary to disable this feature so the modem will attempt to "dial without a number" and connect immediately.

The only change to the original Apple Modem 2400 script was the addition of "X1" within the dial command:

```
!
! The modem is ready so enable answering, or originate a call
!
! To accommodate manual dialing,
! added X1 command to disable
! "wait for dial tone". - PDF 2/5/92
```

```
  !
  @LABEL 8
  pause 5
  ifANSWER 30
  note "Dialing ^1" 3
  write "ATX1DT^1\13"
```

To use the new script, follow these steps:

Step 1

Put the script in the Extensions folder.

Step 2

Open the Remote Access Control Panel and select "Apple Modem 2400 with X1."

Step 3

Open Remote Access and enter a single space in the Phone field. (If you leave the Phone field blank, a dialog box indicates "The connection attempt has failed. You have not specified a phone number in the connection document." Entering a space gets around it.)

Step 4

Enter Name and Password as necessary.

Step 5

Place the call manually (or through your operator).

Step 6

The moment you hear the remote phone number ring, click "Connect" in the Remote Access window. (It takes about 5 seconds for the script to execute from the time you click "Connect" and when the modem goes off hook and actually tries to connect.)

Step 7

The moment you see the "Communicating at xxxx bps" message in the Remote Access Status window, hang up.

Article Change History:
29 Jan 1996 - Updated information on ARA 2.0 and update format.
15 Sep 1994 - Removed binary file. Updated to include ARA 2.0 info.

LaserWriter II Series: Possible Causes of Card Stock Jams

Revised: 5/7/92
Security: Everyone

LaserWriter II Series: Possible Causes of Card Stock Jams

==========

Article Created: 3 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

A customer reported that he uses his LaserWriter IINTX to print employee records onto card stock. After printing about 350 cards, the printer jams.

Are there any recommended guidelines for printing on card stock? Are there any adjustments that I can make to the printer to correct the problem?

DISCUSSION ----------

You can use up to 36-pound card stock via manual feed in the LaserWriter II series printers. However, higher weight stock has a higher content of cotton rag or other dust-producing material. This may be causing paper dust to build up on the paper pickup roller and/or separation pad, which may be causing the jam conditions.

Try cleaning the paper pickup roller with a printer platen cleaner. DO NOT use alcohol. Alcohol removes an oil compound in the rubber, causing it to shrink and damage the roller.

Note that the roller and separation pad are subject to wear. Ensure that these parts are in good working condition.

Search on LaserWriter II and specifications for more information on recommended printing material.

Security: Everyone

Macintosh: Troubleshooting Bus Error Messages

==========

Article Created: 3 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have a Macintosh IIsi running system software version 6.0.7 and Quark 3.0. I'm getting bus error messages when I open the Chooser to select a different printer.

DISCUSSION ----------

We've had other problem reports like this and found that most were caused by the WDEF virus or a corrupt System.

To eliminate the WDEF virus as the cause, follow the instructions in the Tech Info Library article titled "WDEF" Virus: Information.

If the problem persists:

1) Remove all items from the System Folder that you want to save, like third-party INITs, CDEVs, and DAs.

2) Trash the System Folder.

3) Reinstall the system software from locked, known-good disks.

LaserWriter IIf/IIg/Pro: Switching PostScript to HP Emul (9/94)

Revised: 6/5/96
Security: Everyone

LaserWriter IIf/IIg/Pro: Switching PostScript to HP Emul (9/94)

==========

Article Created: 21 February 1992
Article Reviewed/Updated: 28 September 1994

TOPIC ----------

How do I set a LaserWriter IIf, IIg, or LaserWriter Pro for LaserJet emulation, and return it to standard Apple PostScript mode?

I'm using my printer on an IBM network and need to send the commands via text file.

DISCUSSION ----------

Switching to HP Emulation for the Current Job

Below is PostScript code that will switch the LaserWriter IIf, IIg, and LaserWriter Pro PostScript interpreter into HP LaserJet IIP emulation mode for the duration of the current job. It requires first configuring the port to be used for PostScript "Binary" mode (versus Normal), or a rangecheck error will be generated.

```
currentfile /LaserJetIIP statusdict /emulate get exec
```

The code must precede each job that will use HP LaserJet IIP emulation, and only works on the LaserWriter IIf, IIg, and LaserWriter Pro printers. The emulate operator is currently specific to these printers. The emulator will exit, returning to PostScript, if either of the following conditions occur:

- The current job ends.
  This is defined as when the printer receives a control-D or when the emulator's 30-second wait timeout expires. Note that this 30-second timer can't be changed, and overrides the normal WaitTimeout value while the emulator is in control.

- The printer receives the ASCII sequence ESC-DEL-Zero (Decimal ASCII 27, 127, 48).

This causes the emulator to exit to PostScript, where more printing can occur before the end of job. However, when the emulator exits, it ejects the current page. This prevents any mixing of PostScript and HP LaserJet data on a single page.

Permanently Switching to HP Emulation

A communications port can also be configured for HP LaserJet IIP emulation so that the setting persists across jobs and power cycles. This is just as if the setting were made from the LaserWriter Utility's Configure Communication feature, and requires that the push-wheel mode switch be in one of positions 6 through 9.

To configure the serial port, download this PostScript code to your LaserWriter:

```
(%Serial_NV4%)
<< /Protocol /Binary
   /Interpreter /LaserJetIIP
>> setdevparams
```

The first line tells the setdevparams operator which parameter set is to be changed. Possible values here are:

```
(%Serial_NV%)  for push-wheel position 6
(%Serial_NV2%) for 7
(%Serial_NV3%) for 8
(%Serial_NV4%) for 9
```

If the mini-DIN 8 port is being used, substitute "SerialB" into the string for all instances of "Serial."

Note: If you remove the "_NV" portion from "(%Serial_NV4%)", such as (%Serial4%), the settings will not persist and the printer will return to PostScript mode under the conditions mentioned above.

To configure the parallel port, download this PostScript code to your LaserWriter:

```
%%Begin (%Parallel_NV3%)    %Modifies the 3rd changeable pos.(setting 8)
<< /Enabled true            %Mark a dictionary on the stack with key/value
   /HasNames false          %pairs for the various settings.
   /Protocol /Raw
   /Interpreter /LaserJetIIP
   /On true >> setdevparams %Create the dictionary and execute setdevparams
                            %(which uses it to modify the parameter set.)
%%End
```

The first line tells the setdevparams operator which parameter set is to be changed. Possible values here are:

```
       (%Parallel_NV%)  corresponds to 6
       (%Parallel_NV2%) "         " to 7
       (%Parallel_NV3%) "         " to 8
       (%Parallel_NV4%) "         " to 9
```

Note: If you remove the "_NV" portion from "(%Parallel_NV3%)", such as (%Parallel3%), the settings will not persist and the printer will return to PostScript mode under the conditions mentioned above.

Switching Back to PostScript

Switching a communications port back to PostScript mode requires sending the following variation of the above code to a port that is still configured for PostScript:

```
  (%Use the same parameter set here as used in the previous code%)
  << /Protocol /Binary
     /Interpreter /PostScript
  >> setdevparams
```

If all available ports have been configured for HP LaserJet IIP emulation, returning to PostScript will require changing the push-wheel switch to one of positions 0 through 5.

TOPIC -----

Are there any concerns about writing to an EPROM in the LaserWriter IIf and IIg? (With the LaserWriter NT or NTX, there's a limit to the number of changes before it becomes worn out.)

DISCUSSION -----

Unlike the LaserWriter IINTX, which uses battery backed nonvolatile RAM to store settings, the LaserWriter IIf and IIg use a device much like that in the LaserWriter IINT. But where the IINT is limited to approximately 10,000 writes, the newer device allows approximately 50,000. The LaserWriter IINTX has no such limit, but the battery within the memory device will eventually fail -- resulting in the same symptoms.

PostScript Level 2: Doesn't Check for Device-Specific Operators

==========

Article Created: 27 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I upgraded from a LaserWriter IINTX to a LaserWriter IIg, to print jobs made by Sun workstations. Files that printed on the LaserWriter IINTX now fail to print on the LaserWriter IIg. The problem file generates a calendar for 1992. Examining a log shows that the "load" command isn't finding a key entry and causes the error. This is somewhere in the following PostScript extract:

```
"/a4 [ [300 72 div 0 0 -300 72 div -72 3436 ] 292 3365
 {statusdict /jobstate (printing) put 0 setblink
 margins exch 142 add exch 256 add 8 div round cvi frametoroket
 statusdict /jobstate (busy) put 1 setblink} /framedevice load
 60 45 {dup mul exch dup mul add 1.0 exch sub} /setscreen load
 {} /settransfer load /initgraphics load /erasepage load ] cvx
 statusdict begin bind end readonly def"
```

Is the software that creates the Postscript doing "unapproved" things to the statusdict dictionary? Or are the problems due to a change from Level 1 to Level 2 Postscript in the LaserWriter IIf and IIg?

DISCUSSION -----

After a quick look at the CAL code, we noticed at least a couple of device-specific operators.

The first, framedevice, is the one causing the failure on your LaserWriter IIg. The framedevice operator no longer exists in PostScript Level 2 implementations. It wasn't included in a number of Level 1 implementations either. Nearly every mention of the operator in Adobe documentation warns about its use, all pointing out that the code should definitely understand

the environment it's used on. It's interesting that an application is generating code that uses it without first verifying its existence on the printer.

The second problem operator is setblink. It actually occurs first in the code, but is in a deferred procedure and therefore doesn't get a chance to cause problems because it's never executed. (More on this later.) It's also device-specific to some printers that allow program control over the user indicator panel.

Finally, both of the problem operators are in a definition of the a4 paper size. This is the same segment you included in your question. What's almost humorous is that nothing in the rest of the code refers to this definition. It isn't used. (That's why the setblink operator never has a chance to fail.) Commenting out the a4 definition doesn't affect the program's operation or output. Also, a4 is already defined in many PostScript implementations. It certainly doesn't need to be redefined for the LaserWriter IIg. If the Sun generated this by a "prep" file, you should be able to comment it out to prevent causing further problems with other files.

In any case, the program that generated the PostScript should have first checked for the existence of these operators. The problem is showing up because of changes from PostScript Level 1 to Level 2, but the real culprit is the PostScript code itself. It fails to test adequately the environment it's running in.

TOPIC -----

We have a Motorola 147 microcomputer system running UNIX 568, release 5, version 6. We would like to use some Macintosh Plus or SE computers as terminals and need to know if there is something that will work with MacTerminal or some other emulator to allow file transfers between the computers.

DISCUSSION -----

See if your UNIX host has one of the standard file transfer protocols such as Xmodem, Kermit, or FTP. Most UNIX systems have support for file transfer using these protocols. MacTerminal 3.0 comes with an XMODEM Tool for file transfer. Other terminal emulators such as PacerTerm or VersaTerm-Pro provide other file transfer Tools such as PacerFT, and VersaTerm FTP Tool.

06/18/92 - REVIEWED
- For technical accuracy

TOPIC ----------

I have some questions about DAL:

1) Is it possible to buy DAL Server for VM/CMS directly from Apple, instead of Computer Associates?

2) Is DAL available for DOS? For Windows?

3) Is DAL for NetWare shipping?

DISCUSSION ----------

1) Yes, customers can buy DAL products directly from Apple buy sending an order to APDA.

2) Blyth software has shipped DAL for DOS and DAL for Windows since November 1991.

3) Novell is shipping DAL for Netware SQL.

DAL: How to Access Database on Remote VAX

Revised: 9/2/92
Security: Everyone

DAL: How to Access Database on Remote VAX

==========

Article Created: 21 February 1992

Article Change History

05/08/92 - REVIEWED
- For technical accuracy

TOPIC ----------

We have some VAX systems running VAX/VMS. What logical names are required for DAL on one VAX to access an ORACLE RDBMS on the other VAX? We were able to run SQLPlus, but we've customized it so the access required a few logical names.

DISCUSSION ----------

If the VAX systems are part of a VAXcluster, you must connect to a node that is running the DAL Server and AppleTalk for VMS. If the DAL Server and AppleTalk for VMS has been licensed for each node on the VAXcluster, then you may access a shared database via DAL from any node running the DAL Server and AppleTalk for VMS.

If the VAX systems aren't part of a VAXcluster, you still can access the remote database, if the database is set up for remote access. ORACLE, Ingres, and Sybase all have mechanisms to support remote database access.

For example, if you have the DAL Server and AppleTalk for VMS installed on VAX A and the ORACLE database installed on VAX B, you can allow users on VAX A to access the database on VAX B in this way:

1) Select either the Async Driver, the DECnet Driver, or the TCP Driver for SQL*Net during ORACLE installation.

2) Create a database link for each database. This database link contains

enough information to uniquely identify a path to the remote database. It normally contains the following information:

- Network protocol
- Nodename
- Dbname
- Username/password
- Protocol options

If the users on VAX A can access the database on VAX B, then the DAL Server has access, too. The database application handles the Async, DECnet or, TCP/IP communications between VAX A and VAX B, not DAL.

DAL: Protocols for NetWare SQL, Btrieve Hooks

Revised: 9/2/92
Security: Everyone

DAL: Protocols for NetWare SQL, Btrieve Hooks

==========

Article Created: 25 February 1992

Article Change History

05/08/92 - REVIEWED
- For technical accuracy

TOPIC ----------

What protocols support DAL for NetWare SQL? What pieces of NetWare, if any, must be co-resident? Are there hooks into Btrieve?

DISCUSSION ----------

The DAL Server NLM (NetWare loadable module) supports AppleTalk via ADSP. You can connect the Macintosh to any segment of the network (LocalTalk, Ethernet, Token Ring, and Arcnet). DAL for NetWare SQL uses hosts.cl1 or DAL Preferences file with the familiar syntax:

```
ServerName:atalk:ServerName.AppleTalkZone
```

Files required for the NetWare File Server side:

- NetWare v3.11 or later
- Mac.NAM v3.4
- BTRIEVE.NLM v6.0 or later
- NWSQL.NLM v3.0 or later
- APPLETLK.NLM v3.01
- TLI.NLM v3.11
- DALSVR.NLM v1.0

NetWare SQL uses NetWare Btrieve as its record manager. Consequently, front-end DAL applications running on the Macintosh can share files created and maintained by the thousands of Btrieve applications already on the

market.

PowerBook: Don't Make Direct Calls to Serial Chip 2/92

Revised: 5/16/94
Security: Everyone

PowerBook: Don't Make Direct Calls to Serial Chip 2/92

==========

Article Created: 17 February 1992

TOPIC -----

We're using a PowerBook 170 with software we developed. This software accesses a serial device attached to the external serial port.

When we use the same software under System 7.0.1 on a Macintosh IIci, it works fine. When we attempt to use it on a PowerBook 170, the program bombs out and the serial ports lock up. The internal modem on the PowerBook 170 doesn't appear to be interfering. All settings seem correct.

What could be the source of this problem? Were there any changes to the serial port on the PowerBook 170 that might require some sort of special serial switch?

DISCUSSION -----

It sounds like the application is making serial communication calls directly to the PowerBook 170's serial chip. An application should use normal communications calls to talk to the serial driver; it should never attempt to get direct access to the SCC hardware.

The serial chip is turned off when not in use (in order to conserve power). If your application makes normal serial communications calls, the serial driver knows how to turn the serial chip back on. However, an application that attempts to go directly to the serial chip will wind up talking to the chip when it's turned off, resulting in a loss of communication.

PowerBook Fax/Data Modem: How Escape Sequence Differs from Hayes

Revised: 5/16/94
Security: Everyone

PowerBook Fax/Data Modem: How Escape Sequence Differs from Hayes

==========

Article Created: 18 February 1992

TOPIC ----------

I'm reluctant to believe that the PowerBook internal modem is fully compatible with Hayes' patented guard time escape sequence. Is this a serious issue?

DISCUSSION ----------

The issue relates to the different ways the escape sequence is implemented by Hayes and Apple. The primary difference is that Hayes implements a guard time and Apple doesn't. And no, it isn't a serious issue.

Background

You can use an escape sequence when the modem is on-line and you need to enter commands to the modem, but you don't want to disconnect from a call. The escape sequence ensures that you won't lose the modem connection or data while the modem is off line in the command state. Because of the escape sequence, modems can provide reliable transmission of data, distinguishing the predetermined escape sequence characters from the random occurrence of like characters in user data.

Hayes' Implementation

To enter the escape sequence, follow these steps:

1) Pause 1 second (Hayes calls this the guard time) or longer.

2) Enter +++ (3 plus characters), and pause 1 second or longer.

3) The "OK" from the modem acknowledges that it has escaped from the on-line data state, and you may begin entering AT commands.

When you're ready to resume your call to a remote system, enter ATO, and press RETURN. This is the command to return on-line.

Apple's Implementation

There are two ways to enter into the command state while on line:

- Send a BREAK to the modem (refer to the ATYn command on page 100 of the Macintosh PowerBook Fax/Data Modem User's Guide for more details), and it will immediately drop into command state, or

- Enter the appropriate escape sequence.

The following strings are recognized as valid escape sequences:

```
+++ATxxx....xxx<CR>
+++<CR>ATxxx....xxx<CR>
```

<CR> is RETURN.
xxx....xxx is a character string consisting of 0 to 13 ASCII characters.

After the escape command is recognized and executed, the modem sends an OK result code.

NOTE: This escape sequence is only based on character recognition, regardless of any guard time before, during, or after the DTE sends the string to the modem. This command isn't recognized in command mode.

System 7: Modifying the Keyboard Layout Switching Command

Revised: 1/23/95
Security: Everyone

System 7: Modifying the Keyboard Layout Switching Command

==========

Article Created: 21 February 1992
Article Reviewed/Updated: 23 January 1995

TOPIC ----------

Background

Under System 7.x, I can switch keyboard layouts by pressing the Command, Option, and Space Bar keys. This feature is probably not well known in the U.S., where normally only one keyboard layout is installed. However, in most European countries you may have at least two keyboard layouts installed.

In Norway we have three: two different Norwegian (only one key is different) and the U.S. keyboard layout. The ability to change keyboard layouts in environments with employees from different countries is appreciated. And with the Keyboard menu (between the Help menu and the Application menu) enabled with a little help from ResEdit, it's very easy to find the keyboard layout in use.

Problem

Many heavy users in the graphics business have upgraded to System 7.x, or bought Macintosh Quadra systems. The keyboard layout switch shortcut causes problems in some common graphics applications such as Adobe PhotoShop, Adobe Illustrator, and Quark XPress.

Adobe PhotoShop and Adobe Illustrator use the Command, Option, and Space Bar sequence to zoom the picture in, while Quark XPress uses this sequence to get a special space character called em-space (used a lot among professional typographers).

We've found a workaround with PhotoShop and Illustrator. If we press the space key before the Command and Option keys, the keyboard layout won't change. The Quark XPress problem is more difficult, since the Command, Option, and Space Bar sequence displays a special character, rather than executing a command.

Do you have any solutions for this?

DISCUSSION ----------

NOTE: System 7.5 comes pre-installed with many keyboard layouts. Also, if a System 7.5 Easy Install is performed, all the European keyboard layouts are installed as a default. The user can limit the keyboard layout installation to only the U.S. keyboard layout if a Custom Install is performed. For more information about workarounds and alternatives to using ResEdit see the following article:
"System 7.5: Command-Option-Spacebar Application Conflict (10/94)"

WARNING: The following instructions refer to using ResEdit to alter your system software. Apple Computer, Inc., is not liable for any damage done to your software through the use of ResEdit to alter the software. The User Assistance Center phone representatives (at 800-SOS-APPL) do not provide technical support for ResEdit. It is supported by APDA. For contact information on APDA, search the Tech Info Library under "APDA".

The entries in the 'KSWP' system resource (ID = 0) control the switching of the keyboard layouts. Actually, the entries in the 'KSWP' resource control more than that. Inside Macintosh Volume VI fully documents this resource on pages 14-43 to 14-44, and pages 14-98 to 14-99.

The standard U.S. 'KSWP' resource looks like this:

```
FFFF 3101 FFFC 3109
FFFE 4601 0000 4201
0000 0000
```

Each long word entry controls a separate function. The first two bytes (integer) form the verb that the KeyScript procedure will act upon. The third byte is the virtual key code for the key that you must press, and the fourth byte is the modifier state that must exist when you press the key.

Table 14-3 on page 14-44 of Inside Macintosh Volume VI outlines the verbs for the KeyScript procedure.

You can find most of the virtual key codes on pages 191 and 192 of Inside Macintosh Volume V, or by using ResEdit on the 'KCHR' resource in the System file.

Note on modifier state: Option key down is equal to 8; Shift key down is equal to 2; and Command key down is equal to 1. If you press multiple modifier keys at the same time, their values are added together for the modifier state entry.

The second entry in the standard U.S. 'KSWP' resource (FFFC 3109) is the one that causes the problems you describe. The first two bytes, $FFFC or -4, form the verb "smKeyNextKybd" which means "Switch to next keyboard in active script." The third byte, $31, is the virtual key code for space. The fourth byte is Command key down (1) plus the Option key down (8) which equals $09.

There are three ways to solve the problem. The first method is rather limiting and not very flexible. The second is the most straightforward, and probably the best. The third is the most flexible, but the most complicated from a user's point of view.

- Delete the entry that causes the problem.
 The 'KSWP' resource would then look like this:

```
FFFF 3101 FFFE 4601
0000 4201 0000 0000
```

- Change the virtual key code to something other than $31.
  Changing it to $4C would allow the Command-Option-Enter key sequence to switch keyboard layouts. The 'KSWP' resource would look like this:

```
FFFF 3101 FFFC 4C09
FFFE 4601 0000 4201
0000 0000
```

- Add two new entries to the 'KSWP' resource.
  One would disable switching from the current keyboard (verb "smKeyDisableKybdSwitch") and the other would enable keyboard switching (verb "smKeyEnableKybds"). Command, Option, and Enter disable switching, and Command, Option, and Return enable switching. The 'KSWP' resource would look like this:

```
FFFF 3101 FFFC 3109
FFFE 4601 0000 4201
FFF4 4C09 FFF9 2409
0000 0000
```

Note: The four bytes of zeroes at the end of the resource are filler and must be present.

Article Change History:
23 Jan 1995 - Added warning about ResEdit not being supported by UAC and info about default keyboard layouts in System 7.5.

LaserWriter IIg: Link Signals on 10Base-T

==========

Article Created: 27 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm testing a LaserWriter IIg on a Banyan network. I'm using a twisted pair transceiver. In my network environment and a variety of vendor equipment, I can't have equipment sending out any "Link signals" between networking components. It appears the transceiver is emitting some sort of link signal. Is there any way I can turn off this signal?

DISCUSSION ----------

There isn't an option to turn off the "link beat" signal on the Apple Ethernet NB cards or the LaserWriter IIg when using the 10Base-T transceivers. The "link beat" signal is part of the 10Base-T standard. The cards are designed for use on 10Base-T compliant networks only, and no provisions have been made to accommodate any non-standard Ethernet configuration.

One possible solution, Asante's 10T MAU (medium access unit), allows any computer with a thick Ethernet port to connect to a 10BaseT twisted-pair network. The device, which resembles an external modem, contains two ports:

- A 15-pin AUI port for a thick coaxial connection, and

- An eight-pin RJ-45 port for connection to twisted-pair cable.

The 10T MAU unit also provides four LED status displays and two switches that enable or disable the link integrity and SQE signals. The device is compatible with any thick-cable Ethernet card. You could use this device in addition to an Apple Ethernet NB card with the thicknet transceiver option.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

A/UX: Can Mount and Use AppleShare Volumes (9/94)

Revised: 9/19/94
Security: Everyone

A/UX: Can Mount and Use AppleShare Volumes (9/94)

==========

Article Created: 14 February 1992
Article Reviewed/Updated: 19 September 1994

TOPIC ----------

Can I mount AppleShare volumes under A/UX? Can I then manipulate files? If so, how does A/UX handle filenames with blanks in them?

DISCUSSION ----------

Yes, A/UX mounts any AppleShare volume in the AppleTalk network on your desktop. A/UX 3.0 can also do Macintosh File Sharing as in Macintosh System 7.0. It can export any volume from your A/UX computer to be shared in the AppleTalk network. (Note that AppleShare SERVER functionality isn't supported under A/UX.)

The A/UX File Manager handles all files, including A/UX file systems (BSD and System V file systems) and Macintosh HFS (Hierarchical File System) without any problem. This, of course, includes handling file format conversion and copy between different file systems, file permission, and filenames with blanks. As a matter of fact, UNIX is capable of creating filenames with blanks, for example:

```
% touch "This Is Mine"
```

A/UX: Remove Temp Files On Unsuccessful adduser Command (8/94)

==========

Article Created: 25 February 1992
Article Reviewed/Updated: 22 August 1994

TOPIC ----------

I've just set up a server with A/UX. Everything works until I add a new user with the adduser command. I get the reply, "File busy, try again later."

Now I can't change passwd for anyone. I can login and logout as root, edit the /etc/passwd, and modify it with vi, but not with vipw. I can't change my own passwd as root with passwd command. I've even replaced /etc/passwd by /etc/opasswd, and still nothing has changed. I've also restarted the computer twice. I've changed all the privileges, and even changed the file by a user other than root.

I'm NOT running yellow pages (NIS), just networking with NFS, telnet, and so on.

DISCUSSION ----------

You probably had an UNSUCCESSFUL attempt using the adduser command. The "vipw" may have incorrectly set the user password. In turn, it created two locked file called "ptmp" (password temp file), and "gtmp" (group temp file) in the /etc directory.

Removing the /etc/ptmp and /etc/gtmp locked files should take care of your problem.

Article Change History:
22 Aug 1994 - Added the reference to gtmp file.

A/UX: HoneyDanBer (BNU 1) UUCP (9/94)

Revised: 9/14/94
Security: Everyone

A/UX: HoneyDanBer (BNU 1) UUCP (9/94)

==========

Article Created: 25 February 1992
Article Reviewed/Updated: 13 September 1994

TOPIC ----------

I'd like to have this information on UUCP under A/UX 3.0:

- What are the main differences between BNU UUCP and A/UX 2.0 UUCP?

- What is f-protocol in BNU UUCP?

DISCUSSION ----------

Basically, the HoneyDanBer UUCP is a well-known UUCP implementation in the UNIX community. Its overall performance with A/UX 3.0 is better than the one we used in A/UX 2.0.1 and before. These are the differences:

- It supports TCP as well as serial links.

- The file structure of the UUCP system files under /usr/lib/uucp directory are organized differently (new files and new formats).

- It adds more parameters and features for better control on dialers and login checking sequence.

- Almost all the files (for example, Devices, Sysfiles, Systems, and so on) in the /usr/lib/uucp directory have new formats.

- The new A/UX Network System Administration document for A/UX 3.0 describes more details.

The original HoneyDanBer UUCP didn't include the f-protocol. Because of requests for the f-protocol, A/UX 3.0 adds it in the HoneyDanBer UUCP.

The f-protocol is a UUCP protocol used to communicate over X.25 networks. The PAD dialer is a "real" dialer used to set up connections to remove X.25

destinations using MICOM or Motorola PADS, and will probably work on most other PADS.

MacX: Iconified Windows Can't Be Animated

==========

Article Created: 25 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

We're trying to provide a mail program that, when iconified, will change icons to show incoming mail and/or incoming files. But when we iconify windows in MacX, the iconified window can no longer update the icon to show changes in window status.

DISCUSSION -----

The built-in MacX Window Manager doesn't support the window animation after the window has been iconified. In other words, all iconified icons become inactive until de-iconified.

However, other window managers, such as "twm," support this feature even if the client has been iconified. The icon still does animation as it is in the regular window. For example, the "kalaid" client under "twm" demonstrates this capability.

We suggest that you run the client under your favorite window manager.

System 7: Does Not Support Non-SCSI Hard Drives (5/96)

==========

Article Created: 19 February 1992
Article Reviewed/Updated: 27 May 1996

TOPIC ----------

I am using an old HD20 (pre-SCSI disk from a Macintosh 512K) with a Macintosh Classic running System 7. The disk gets corrupted. Is it impossible to use HD20 with System 7?

DISCUSSION ----------

System 7 requires a SCSI hard drive. The Non-SCSI HD20 is therefore not supported by System 7.

(We have seen cases where the HD20s did work with System 7. However, HD20s were never tested with System 7. We have found that sometimes they work fine, and sometimes they don't work at all.)

It is not possible to run Apple HD SC Setup on the HD20s. Therefore, you cannot update the driver. This will absolutely not allow virtual memory or file sharing to work on these drives.

PowerBook: Using External Device to Discharge NiCad Battery 2/92

==========

Article Created: 19 February 1992

TOPIC ----------

When using an external discharge device to discharge the NiCad battery in a PowerBook, is there any adverse effect on the hardware or internal lithium battery?

DISCUSSION ----------

There should be no problems using an external discharge device to discharge and then recharge a the NiCad battery in a PowerBook 140, 145, 160, 170, or 180.

This should NOT be done, however, with a PowerBook 100 or PowerBook Duo, which do not have a NiCad battery.

Security: Everyone

Macintosh Display Cards 8•24 & 8•24 GC: Rev A/B Differences

==========

Article Created: 18 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Why doesn't the ROM upgrade to the Macintosh Display Card 8•24 GC Rev A allow 16-bit color on the Macintosh 16-inch Color Monitor? What is the difference between an upgraded Rev A card and the Rev B card?

Also, why doesn't the Macintosh Display Card 8•24 support 16-bit color on the Macintosh 16-inch Color Monitor?

DISCUSSION -----

Although the ROM upgrade for the Rev A 8•24 GC card allows this card to work with the Macintosh 16-inch Color Monitor, the ROM version isn't the only difference between the Rev A and Rev B 8•24 GC cards. The Rev B card includes a new CLUT/DAC chip that supports a 16-bit color lookup table that is necessary for 16-bit color support. Because this chip isn't available on the Rev A card, this card won't support 16-bit color.

Similarly, since the 8•24 card doesn't have a CLUT chip that supports 16-bit color, this card won't provide 16-bit color support. However, just like the 8•24 GC, you will need to upgrade the ROMs on older versions of this card if you wish to use a Macintosh 16-inch Color Monitor.

Macintosh 16, 21 Color Displays: Chromaticity Values (2/92)

Revised: 5/25/94
Security: Everyone

Macintosh 16", 21" Color Displays: Chromaticity Values (2/92)

==========

Article Created: 21 February 1992

TOPIC ----------

I'm trying to set up Macintosh 16-inch and 21-inch Color Displays with Adobe PhotoShop. I need to get the Phosphor Color settings in order to calibrate the monitors. Adobe said that these must be obtained by the maker of the monitor. What are the chromaticity values?

DISCUSSION ----------

Here are the chromaticity values for the two displays.

Macintosh 16-inch Color Display

	X	Y
RED:	.625 ± .020	.340 ± .020
GREEN:	.280 ± .020	.595 ± .020
BLUE:	.155 ± .015	.070 ± .020

The CIE coordinates for white are:

X=.283 ± .020
Y=.298 ± .020

Macintosh 21-inch Color Display

	X	Y
RED:	.635 ± .020	.333 ± .020
GREEN:	.280 ± .020	.595 ± .020
BLUE:	.152 ± .020	.063 ± .020

The CIE coordinates for white are:

X=.281 ± .020
Y=.311 ± .020

Sys 7: AppleShare 3.0 Print Server Print File Limits (6/95)

Revised: 6/27/95
Security: Everyone

Sys 7: AppleShare 3.0 Print Server Print File Limits (6/95)

==========

Article Created: 30 January 1992
Article Reviewed/Updated: 27 June 1995

TOPIC ----------

Can the AppleShare 3.0 Print Server handle very large (for example, 60MB) print files?

DISCUSSION ----------

Theoretically, there are no limits on how large a print file can be -- you are limited only by the available disk space on the server. However, if a client Macintosh has background printing turned on, PrintMonitor may not be able to handle such large files. If that should happen, the workaround is to spool the document to the server with background printing turned off.

System 7: MacroMaker Is Not Supported

==========

Article Created: 11 February 1992

Article Change History

09/02/92 - REVIEWED
- For technical accuracy.

TOPIC ----------

In the compatibility listing I have for system software version 7.0, it says that MacroMaker is "unnecessary". This seems to indicate that System 7 somehow does macros, but I can't find anything on this in the manuals.

DISCUSSION ----------

"Unnecessary" was a poor word choice. It should have stated that MacroMaker was "not compatible". MacroMaker is not supported in version 7.0, and there are no plans to revise it for version 7.0 compatibility.

There are several third-party macro products that are compatible with version 7.0, including QuicKeys 2 by CE Software.

For more information, search on CE Software.

Macintosh: Using System 7 on HD and Earlier Version on Floppy

==========

Article Created: 11 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I upgraded my Macintosh hard drive to system software version 7.0, but I have some programs that are not version 7.0 compatible that I'd still like to use. Can I start up my Macintosh from a floppy startup disk that is running system software earlier than version 7.0 and use those programs?

DISCUSSION ----------

Yes. You can start up from a system software version 6.0.X startup floppy disk, provided that the Macintosh doesn't require version 7.0.1 or later to run. The Macintosh Classic II, Macintosh PowerBook series, and Macintosh Quadra series do not support system software version 6.0.X.

Note

Version 6.0.X does not recognize the version 7.0 desktop file. When you first start up from the version 6.0.X floppy disk, a dialog will appear reporting that the version 7.0 hard drive is damaged and asking if you want to repair it. (Your hard drive is not damaged.) Click the "OK" button, to create the version 6.0.X desktop file.

The next time you start up from the version 7.0 hard drive, the system software will update the version 7.0 desktop file for any changes that were made during the version 6.0.X operation.

PowerBook Batteries: Long-Term and Short-Term Storage 2/92

==========

Article Created: 12 February 1992

TOPIC ----------

Can you give me a brief summary of the recommended long-term and short-term storage requirements?

DISCUSSION ----------

The Macintosh PowerBook batteries need to cycled through a charge/discharge process on a regular basis, which is why there is a warning to the users not to exceed long-term (6-month) storage.

These rules apply:

Short-Term Storage (1 week or less)

The Macintosh PowerBook can be stored with the battery (fully charged) in the unit without the power adapter plugged in.

Short-Term Storage (1 to 2 weeks)

The Macintosh PowerBook can be stored with the power adapter plugged in. After this period, a charge/discharge cycle should be performed. In other words, use the computer until the battery is drained and then recharge it fully.

Long-Term Storage (up to 6 months)

The Macintosh PowerBook battery should be fully charged, and
- The PowerBook 140/170 must be in a shutdown state.
- The PowerBook 100 must be disconnected.

For more detailed information, see the section on battery storage in the owner's manual.

LaserWriter IINT Manual Feed: Why Paper-Out Light Stays Lit

Revised: 5/8/92
Security: Everyone

LaserWriter IINT Manual Feed: Why Paper-Out Light Stays Lit

==========

Article Created: 13 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

When I print from the manual-feed tray on my LaserWriter IINT, the paper-out status light stays lit. I can still print from the tray without any problem, but the only way I can clear the status light is to open and shut the printer cover.

DISCUSSION ----------

There is a bug in the LaserWriter IINT ROM that causes this. If you have a piece of paper in the manual-feed tray when you issue a manual-feed print job, the status light stays on after the print cycle. The workaround is to send the manual-feed print job, then wait until the status light is blinking before you insert the piece of paper.

There is no other workaround for this problem, and none is planned because it is a cosmetic problem and does not affect the actual operation of the printer.

PowerBook: Using AppleTalk Remote Access with Internal Modem

==========

Article Created: 13 February 1992

TOPIC ----------

How do I configure AppleTalk Remote Access to use my Macintosh PowerBook 170 internal modem? There is no option in the AppleTalk Remote Access Setup to choose the internal modem.

DISCUSSION ----------

You need to configure both the AppleTalk Remote Access Setup and the Macintosh PowerBook Portable control panel to use the internal modem.

1) In the AppleTalk Remote Access Setup, select the Modem port.

2) From the Apple menu, choose Control Panels and select the Portable control panel.

3) In the Portable control panel, you have the option to set the serial port for either the external or internal modem. Set the port for the internal modem (note that this will disable the external serial modem port).

PowerBook: To Send Fax, Hard Drive Must Be Up to Speed 1/96

Revised: 1/4/96
Security: Everyone

PowerBook: To Send Fax, Hard Drive Must Be Up to Speed 1/96

==========

Article Created: 13 February 1992
Article Reviewed/Updated: 4 January 1996

TOPIC ----------

I am having intermittent problems staying connected to Fax machines from my Macintosh PowerBook 170 Fax/Data Modem. I have checked my configurations; I am sending to a known-compatible Fax machine; and I am using a clean phone line.

DISCUSSION ----------

If the PowerBook hard drive has been spun down, and you try sending a Fax before the hard drive is fully spun up, the PowerBook it will be able to make the connection. However, while the hard drive is in the process of spinning up, the Fax/Data modem in unable to send any data even though it is connected. This will cause the receiving Fax machine to detect this call as a "No Carrier" and it will disconnect.

A workaround you can try is to configure the Portable (or PowerBook) control panel so that the hard drive will not spin down. To do this:

Step 1

Choose Control Panels from the Apple menu.

Step 2

Select the Portable (or PowerBook) control panel.

Step 3

Hold the Option key while you click the minutes option, and set it so that the hard drive will not go into the sleep state.

Note

If you are running your PowerBook computer from the battery, doing this will reduce the operational time of the battery because the hard drive will not go spin down, therefore it will always be drawing power. If you are running from the battery, we suggest that you reset the Portable control panel minutes option for the hard drive to spin down after you send the Fax.

System 6: Memory Errors Under MultiFinder 2/93

==========

Article Created: 14 February 1992

Article Change History

02/02/93 - REVISED
• To indicate that this is valid for System 6 only.

TOPIC ----------

I am often asked by Macintosh users running MultiFinder what causes these types of error messages:

- Application has unexpectedly quit (2)
- Not enough Finder memory ...

DISCUSSION ----------

In most cases, these error messages appear when there isn't enough memory allocated to the Finder when running under MultiFinder.

When you are running in Finder only, the Macintosh allocates all available memory to the Finder until an application is run. When you are running under MultiFinder, the Finder is treated as an application and is given a set amount of memory to work with.

To determine if your problem is insufficient memory allocated to the Finder when you are running under MultiFinder, restart your Macintosh in Finder only mode. Then try the same function that resulted in the error message. If you don't get the error message, you need to increase the memory allocated to the Finder when you are running in MultiFinder.

How To Increase Finder Memory Allocation
---
1) Start up your Macintosh in Finder only mode.

2) Open the System Folder of the startup disk, and click the Finder file.

3) From the File menu, choose Get Info (or simply press Command-I on the keyboard).

4) In the Get Info window, increase the amount of memory shown in the Application Memory Size box. Note that any additional memory that is allocated to the Finder will not be available to applications. A good starting point is to increase the memory allocation by 100K.

StyleWriter: Apple vs. Third-Party Ink Cartridge (1/95)

==========

Article Created: 21 February 1992
Article Reviewed/Updated: 3 January 1995

TOPIC ----------

I have been using standard Canon ink cartridges with my StyleWriter printer. An Apple technician told me that using non-Apple StyleWriter Ink Cartridges voids Apple's warranty on the StyleWriter.

Is this true?

DISCUSSION ----------

Apple StyleWriter Ink Cartridges (M8041G/B) are made by Canon for Apple and meet Apple's rigid specifications.

Physical damage to the printer caused by the use of a third-party printhead cartridge or ink refill kits that DO NOT meet Apple’s rigid standards WILL void the warranty.

Although not supported by Apple, the use of Canon, third-party cartridges, or ink refill kits that meet the rigid specifications WILL NOT void the Apple warranty. For best print quality, Apple recommends using the Apple StyleWriter Ink Cartridges for the orignal StyleWriter and StyleWriter II.

Macintosh LC with Apple IIe Card: Copying ProDOS Disks and Files

==========

Article Created: 5 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have a Macintosh LC with an Apple IIe Card installed and an Apple 5.25 Drive connected to the card.

1) Can I disk copy a 5.25-inch disk to a 3.5-inch disk in the Macintosh LC SuperDrive?

2) How do I make a disk copy of a 5.25-inch disk?

DISCUSSION ----------

1) No, you can't do a disk copy because you can't copy from one size disk to another size disk. You need to copy individual files from the 5.25-inch disk to the 3.5-inch disk. The ProDOS utilities can be used to do this.

   Another problem is that some disks may be in the older DOS 3.3 format, which is not supported on the higher-density disks. Though ProDOS will read DOS 3.3 disks, and you can copy DOS 3.3 files to ProDOS, some programs will not run because of operating system differences.

2) To copy standard a 5.25-inch disk with the Apple IIe Card and one Apple 5.25 Drive, use the ProDOS utilities, which provide a copy function. You need to specify the same device for both the original and duplicate. The software prompts you when you need to insert and remove disks. Note that some disks cannot be copied because they are protected.

Macintosh 512K: Upgrade to Macintosh 512Ke Was a ROM Swap

==========

Article Created: 18 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Are there any differences between an Apple-sold Macintosh 512Ke and Macintosh 512K upgraded to a Macintosh 512Ke?

DISCUSSION ----------

There should be no differences between the two, whether the Macintosh 512Ke came from Apple in that configuration or if it was done as an upgrade. The Apple upgrade was a ROM swap from 64K ROMs to 128K ROMs from the Macintosh Plus, and the most significant change was support for the Apple 800K floppy drive.

The only possible difference is that the upgrade didn't include the 800K floppy drive, although this is unlikely because that was the main reason for the upgrade. Every Macintosh 512Ke shipped from Apple had an 800K floppy drive installed.

System 7: Has Bad-Sector-Checking Mechanism for Floppy Disks

==========

Article Created: 18 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

System software version 7.0 seems to have a floppy disk formatting feature that I haven't seen before.

If I format a new disk -- or reformat a previously used disk -- with the "Erase Disk" option and the formatting is successful, there is a "Verifying Format" function before "Creating Directory" appears. The boot blocks and data space are filled with the pattern F6F6.

If the formatting fails part way through the process, and I try to format again and it's successful, there is a "Re-verifying Format" function and the pattern is PKKT.

I also noticed on some floppy disks, which I've reformatted several times with the "Erase Disk" option, that the amount of disk space available decreases, even though there are no files on the disk except the Desktop file. I checked and there was a problem with some of the sectors. These bad sectors showed zeros, while the rest of the disk had the PKKT pattern.

DISCUSSION ----------

There is a bad-sector-checking mechanism for floppy disks in version 7.0, and it is that mechanism that is using up the disk space.

The "Re-verifying Format" message indicates that there was a problem during the first format attempt (a media failure was found on the floppy disk). Most floppy disks don't exhibit this behavior. Any that show the "Re-verifying Format" message multiple times would be suspect. You would most likely find more and more problem sectors with the zero pattern as the system tries to keep the floppy disk usable.

LaserWriter IISC: Is a SCSI Device and Cannot Be Networked

==========

Article Created: 5 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have a LaserWriter IISC that I'd like to connect to a small AppleTalk network. What do I need to do?

DISCUSSION ----------

The LaserWriter IISC is a SCSI device and cannot be used as a network printer.

Apple offers upgrades for the LaserWriter IISC to the LaserWriter IIf or IIg, which have AppleTalk capabilities built in.

3.5" 160MB HDA: Designed for Specific Computers, Not LaserWriter

==========

Article Created: 29 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm trying to use an Apple 3.5-inch, 160MB HDA from a Macintosh Quadra 900 in an Apple external case with my LaserWriter IINTX.

The drive works fine when connected to a Macintosh system, but it isn't recognized by the LaserWriter IINTX. I can successfully use another drive with the same cables and terminator with the LaserWriter IINTX.

I am using LaserWriter Utility 7.0 to access the printer.

DISCUSSION ----------

All drives manufactured by Apple must conform to certain specifications, which the 3.5-inch, 160MB drive does. However, the 3.5-inch, 160MB drive was designed and tested to work ONLY in these Macintosh models:

- Macintosh Quadra 700
- Macintosh Quadra 900
- Macintosh IIfx
- Macintosh IIci

Many times Apple Engineering, Service, and Marketing decide to ship products in certain configurations based on availability, pricing, and technical specifications (such as Term Power, Power Draw, and so on). Keeping this in mind, it is important to use and/or order the correct part for the corresponding Macintosh system. Apple drives are not to be used in systems other than those for which they were originally intended.

System 7: Use CMS SCSI Utility INIT 7.0.2e or Later

==========

Article Created: 31 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have a Macintosh PowerBook 140 with an internal hard drive running system software version 7.0.1. I am trying to connect a Syquest SCSI removable drive running CMS SCSI Utility 5.6, but the Syquest drive will not start up.

I had the same problem with the Syquest drive when I tried to connect it to a Macintosh PowerBook 170; however, the Syquest drive works fine with my Macintosh II and Macintosh IIfx.

DISCUSSION ----------

CMS Enhancements has a new CMS SCSI Utility INIT (7.0.2e) to use in conjunction with the CMS SCSI Utility software, which allows a removable SCSI drive to run on a version 7.0.1 system. Since the Macintosh PowerBook series require version 7.0.1, I assume that the Macintosh II and IIfx configurations worked because they have system software versions earlier than 7.0.1 installed.

Note that CMS Enhancements has released a new version (7.0.2) of the CMS SCSI Utility software. However, it is not mandatory that you upgrade to this version because the new CMS SCSI Utility INIT 7.0.2e is backward compatible with other versions of the utility software.

Tulin Hermit Crab Drive: Compatibility w/ Macintosh LC, Classic

==========

Article Created: 14 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have a Tulin Corporation Hermit Crab external hard drive that uses power from the external floppy port of the Macintosh. I can use the drive with a Macintosh Plus, but it won't work with a Macintosh Classic.

Is there a known compatibility problem with this hard drive and the Macintosh Classic?

DISCUSSION ----------

Tulin Corporation is aware of a problem. Apparently, when the older version of the Hermit Crab drive is connected to a Macintosh Classic or a Macintosh LC, it does not spin up properly. Tulin indicated that the problem is related to the amount of power the drive draws from the Macintosh (12 watts).

Tulin does have a version of the Hermit Crab drive that works with the Macintosh Classic and Macintosh LC. Contact them directly for more details.

On AppleLink, you can find contact information on a company mentioned in this article by clicking the "Library Index" button in the lower-center of the Tech Info Library search window, then opening the "Third Party Company Directory" folder.

Apple Color Monitors: Phosphor CIE Coordinates (5/96)

==========

Article Created: 3 March 1992
Article Reviewed/Updated: 23 May 1996

TOPIC ----------

This article lists the phosphor CIE coordinates for Apple color monitors. These CIE Coordinates apply only to high-resolution color monitors.

DISCUSSION ----------

IMPORTANT: These coordinates should accurately represent these displays, however Apple Computer does not guarantee that your monitor will match these values exactly. Apple Computer also reserves the right to change these values at any time without notice.

Macintosh 21-Inch Color Display
==========

Phosphor CIE Coordinates:

RED	x = 0.635	y = 0.333
GREEN	x = 0.280	y = 0.595
BLUE	x = 0.152	y = 0.063

Apple Multiple Scan 15 Display
==========

Phosphor CIE Coordinates:

RED	x = 0.610	y = 0.342
GREEN	x = 0.298	y = 0.588
BLUE	x = 0.151	y = 0.064

Apple Multiple Scan 20 Display
==========

Phosphor CIE Coordinates:

RED x = 0.625 y = 0.340
GREEN x = 0.280 y = 0.595
BLUE x = 0.155 y = 0.070

AppleVision 1710 and 1710AV Display
==========

Phosphor CIE Coordinates:

RED x = 0.625 y = 0.340
GREEN x = 0.280 y = 0.595
BLUE x = 0.155 y = 0.070

Apple Multiple Scan 17 Display
==========

Phosphor CIE Coordinates:

RED x = 0.635 y = 0.332
GREEN x = 0.283 y = 0.606
BLUE x = 0.153 y = 0.0621

Macintosh 16-Inch Color Display
==========

Phosphor CIE Coordinates:

RED x = 0.625 y = 0.340
GREEN x = 0.280 y = 0.595
BLUE x = 0.155 y = 0.070

AppleColor High-Resolution RGB Monitor
==========

Phosphor CIE Coordinates:

RED x = 0.625 y = 0.340
GREEN x = 0.280 y = 0.595
BLUE x = 0.155 y = 0.070

Material Safety Data Sheets: General Information (10/94)

Revised: 10/10/94
Security: Everyone

Material Safety Data Sheets: General Information (10/94)

==========

Article Created: 13 February 1992
Article Reviewed/Updated: 10 October 1994

TOPIC ----------

This article provides general information about, and a discussion of, Material Safety Data Sheets -- commonly known as MSDSs.

DISCUSSION ----------

A Material Safety Data Sheet is an occupational safety and health document. State and federal law requires the manufacturer, importer, and distributor of any chemical substance used in a workplace to provide Material Safety Data Sheets along with the first shipment of that substance. The law also requires employers that use chemical substances to keep the MSDS on file and train employees in their use. An MSDS contains physical, chemical, and health- and safety-related information about the chemical substance.

The law does not require MSDSs for everything used in a workplace setting. For example, you will not find MSDSs for your pencils or pencil sharpeners. The law exempts any "article" that does not release hazardous substances under conditions of normal use from the MSDS requirements. The ONLY Apple product we have ever found that required an MSDS is a machine oil we provide to our service providers for servicing our vintage Daisywheel printer.

Despite this legal exemption, some companies routinely demand MSDSs for everything they buy. In some companies, provision of MSDSs is a standard purchasing contract term. To satisfy this demand, some of our vendors (but not all) routinely prepare MSDSs for whatever they make and are available for the asking.

AAC Fulfillment has MSDSs available on some products like PowerBook batteries and LaserWriter toner cartridges and printer ribbons. Contact the Apple Assistance Center for information on availability of a particular MSDS.

Article Change History:
10 Oct 1994 - Minor clarification of wording.
28 Jul 1994 - Updated information, included where to get MSDS.
10 Mar 1994 - Revised formatting, updated information on availability of MSDS.

LaserWriter: Printing Bold Characters from VAX

Revised: 9/30/92
Security: Everyone

LaserWriter: Printing Bold Characters from VAX

==========

Article Created: 4 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I'm using a Quadra and Microphone II (version 4) to dial into All-in-One on a VAX. It works great, my screens look good, I can use PF keys, and so on. However, when I print to the LaserWriter IINT, anything that was bold prints out on 2 lines. I assume that it is doublestriking the line to get the bold effect, not realizing it's a LaserWriter image-based printer. The LaserWriter is connected to the Quadra.

Do you know of any drivers that would let the printer know what it's doing? Do you think Microphone would? Could I use the PATHWORKS printer drivers without installing PATHWORKS?

DISCUSSION -----

Your problem is caused by the VAX sending the LaserWriter control characters that are understood only by DEC laser printers or third-party printers with DEC emulation. On a DEC LN03, for example, in order to bold a string, you have to enclose the string with 2 control characters, one at each end. You also have to do this twice, for the top half and the bottom half of the string. When not interpreted, this prints out as two lines, sometimes with extra characters at the beginning or at the end of the string.

PATHWORKS uses a print symbiont called VAXshare symbiont to convert VMS text into PostScript data before sending it to the LaserWriters. Another symbiont, called the PostScript printer symbiont, transfers data to a Digital PostScript printer.

You'll need to send VMS text to the VMS queue system, and need a similar "symbiont" to do the translation to PostScript. Unfortunately, no vendor

is selling just the VAX queue symbiont alone. They all come as part of the package. You might want to contact Pacer and Alisa to see if they sell the VAX print service separately.

MicroPhone won't solve this problem for you. And you can't use PATHWORKS' VAXshare print service without purchasing PATHWORKS for Digital.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Personal LaserWriter: No Refurbishment Kit

Revised: 9/30/92
Security: Everyone

Personal LaserWriter: No Refurbishment Kit

==========

Article Created: 29 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Why doesn't Apple offer a refurbishment kit for the Personal LaserWriter printers?

DISCUSSION -----

The Personal LaserWriter engine life is rated at a minimum of 150,000 pages. The pick-up roller and separation pad each have a minimum rated life of 50,000 pages. However, since most users use the cassette tray, these parts will most likely last well beyond their 50,000-page rating. Also, the fuser assembly, laser scanner assembly, and other moving parts are expected to last the life of the engine. Therefore, there is no need for a refurbishment kit.

The LaserWriter and LaserWriter II engines have engine-life ratings that exceed the working life of several of their major modules (such as the fuser, cassette pick-up assembly, and transfer guide assembly). Therefore, refurbishment programs were created to ensure that proper maintenance is performed at the proper intervals.

LaserWriter IIf and IIg: Function of Jumper J11

==========

Article Created: 11 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

On the Apple LaserWriter IIf and IIg I/O controller board, near the ROM chips, is a set of jumper pins labeled J11. What is their function?

DISCUSSION -----

The jumper pins labeled J11 are at board position L7. The jumper pins allow the use of 8-megabit ROM chips, providing a total of 4MB of ROM space.

The jumper is factory set at the 2MB setting to allow the use of four 4-megabit ROMs, providing a total of 2MB of ROM space. There are no existing Apple or third-party upgrades that use the 4MB setting.

All Apple LaserWriter IIf and IIg printers should be set at the 2MB setting.

StyleWriter Sheetfeeder: Paper Pickup Ratcheting Noise Is Normal

Revised: 9/30/92
Security: Everyone

StyleWriter Sheetfeeder: Paper Pickup Ratcheting Noise Is Normal

==========

Article Created: 11 February 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

My StyleWriter sheetfeeder makes a ratcheting noise during the paper pickup process. Is this noise normal?

DISCUSSION ----------

The StyleWriter printer sheetfeeder does make a racheting noise during the paper pickup process. This noise is normal and is no cause for concern.

The sheetfeeder mechanism is powered by a single drive gear, which mates to the StyleWriter printer. The sheetfeeder contains no sensors or other feedback devices for the StyleWriter to gather paper status information. The paper pickup sequence consists of a carefully orchestrated set of forward and reverse paper-feed motor movements. These movements allow the paper pickup rollers to pick up a single sheet of paper and return to their home position. The ratcheting sound is created by an integral one-way clutch mechanism inside the sheetfeeder.

ImageWriter LQ:Testing Sheetfeeder/Tractor-Feed Paper-Out Sensor

Revised: 5/24/93
Security: Everyone

ImageWriter LQ:Testing Sheetfeeder/Tractor-Feed Paper-Out Sensor

==========

Article Created: 20 February 1992

TOPIC ----------

The ImageWriter LQ has two paper-out sensors; however, the Technical Procedures Manual has information for testing only the least-used bottom-feed sensor.

How can I test the other paper-out sensor used for the sheetfeeder and tractor-feed paper?

DISCUSSION ----------

To test the paper-out sensor used for everything except bottom-feed paper, follow these steps:

1) Using standard procedures, remove the printer top cover.

2) Power on the printer without any paper inserted.

3) Configure a multimeter to measure between 0-5 volts DC.

4) Locate connector C9 on the logic board.

5) Connect the GND lead to pin 5 and the positive lead to pin 3. Without any paper inserted in the printer, the measured voltage should be approximately 4-5 volts.

6) Insert a piece of paper in the printer and monitor the multimeter. As paper is inserted, the voltage should drop from 4-5 volts to almost zero volts. Repeat this process several times to ensure proper operation of the sensor.

   If this change does not occur, the paper-out sensor is probably defective and should be replaced.

PowerBook Fax Sender: Configure Receiving Fax to Print Header

Revised: 5/16/94
Security: Everyone

PowerBook Fax Sender: Configure Receiving Fax to Print Header

==========

Article Created: 28 February 1992

TOPIC ----------

The Fax/Data Modem for the PowerBooks doesn't allow the receive modem to date stamp the top of the page as other fax machines do when they send faxes. After testing it here I've come to the conclusion that this has to be something in the software and not the fax itself that is dropping this date stamp from the top of the page.

DISCUSSION ----------

Depending upon how a fax machine is configured:

- It can generate a header, which may include the date and time as a part of the fax image it sends, or

- Automatically print a header on the fax image it receives.

The PowerBook Fax Sender software doesn't include a header in the fax it generates. It does however send its Station ID. It's the responsibility of the receiving fax machine to shape and include it in the fax image it prints. The receiving fax machine needs to be configured to do this.

So, if you have your fax machine configured to generate headers on sent faxes but not on received ones, this would explain why you aren't seeing headers printed on faxes received from PowerBooks.

AppleColor High-Res RGB Monitor: Voltage Range Label Error

Revised: 9/3/93
Security: Everyone

AppleColor High-Res RGB Monitor: Voltage Range Label Error

==========

Article Created: 28 February 1992
Article Last Reviewed/Updated: 2 September 1993

TOPIC ----------

Later model 13-inch AppleColor High-Res RGB Monitors no longer designate on the back panel that they are compatible with voltages from 100 to 240. They show only 110-120 volts. Have there been any engineering changes to this monitor?

If the monitor is being driven from the power output on the back of a Macintosh, will the correct voltage be delivered to the monitor even when the Macintosh is plugged into a European power source?

DISCUSSION ----------

The current specification sheet states that the AppleColor Hi-Res RGB Monitor (model number M1297) supports a voltage range from 85 to 270 VAC, and a power frequency range of 47 to 63 Hz.

There were some internal design changes in the revision B monitor, but the voltage and frequency range remained the same. Most of the changes were made to meet the Swedish guidelines for ELF emissions.

The back panel identification was an oversight when the labels were printed, and the voltage range information was left off the label. Our engineers are aware of the problem and this should be rectified in future shipments of the monitor.

In regard to the power out of the back of a Macintosh II, the power supply switches the power from the wall to the output plug. No voltage processing takes place. Any device that has the power plugged into the back of a Macintosh must meet the power requirements of that country.

Article Change History
2 September 1993 - Updated to reflect that these monitors are no longer in

production

A/UX: Remote Dump to Magnetic Tape Drive

Revised: 6/2/92
Security: Everyone

A/UX: Remote Dump to Magnetic Tape Drive

==========

Article Created: 3 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm trying to do a remote dump (rdump) from a Macintosh IIfx on an Ethernet network to a 1/4-inch cassette tape drive on a Concurrent computer on the same network. The device file for the tape drive is /dev/rctp. The address on the network and in the /etc/NETHOSTS is mdsaero. I think everything is set up properly now since the dump process begins. The following is the command I issued:

```
macunix.root 1 # rdump 0usf 28800 mdsaero:/dev/rctp /dev/dsk/c5d0s3
  DUMP: Date of this level 0 dump: Mon Feb 24 15:33:14 1992
  DUMP: Date of last level 0 dump: the epoch
  DUMP: Dumping /dev/rdsk/c5d0s3 (/users) to /dev/rctp on host mdsaero
  DUMP: mapping (Pass I) [regular files]
  DUMP: mapping (Pass II) [directories]
  DUMP: estimated 201945 blocks on 0.41 tape(s).
  DUMP: Protocol to remote tape server botched (code /etc/rmt: Command not
found.
?).
rdump: Lost connection to remote host.
  DUMP: Bad return code from dump: 1
macunix.root 2 #
```

Note: slice 3 is a 400MB (approximately) partition and the tape cassette is a 525MB tape. The procedure also won't work with a 120MB tape.

DISCUSSION ----------

According to the above error message, "... remote tape server botched (code /etc/rmt: Command not found," the problem is apparently on the remote host.

The /etc/rmt can't be found in the mdsaero host. The /etc/rmt is a remote magtape protocol program used by the remote dump (rdump) and remote restore (rrestore) programs in manipulating a magnetic tape drive through an IPC (Inter Process Communication) connection. The /etc/rmt is normally started up with an rexec() and rcmd() call.

Check the mdsaero host to see if it supports the remote procedure call for a remote magnetic tape drive. A/UX and most BSD UNIX systems support this facility.

MacX: snftobdf Utility Converts SNF Fonts to BDF (9/94)

Revised: 9/16/94
Security: Everyone

MacX: snftobdf Utility Converts SNF Fonts to BDF (9/94)

==========

Article Created: 4 March 1992
Article Reviewed/Updated: 15 September 1994

TOPIC ----------

On the Tech Info Library, an article mentions a public domain software utility called 'snftobdf' converter for X-Window fonts. Is this a UNIX- based product that compiles on the X client or at the MacX end?

We need to send Adobe, BDF, and SNF fonts to MacX from a Motorola X-Window/Motif client that's running Word Perfect and FrameMaker for UNIX.

DISCUSSION ----------

Yes, the "snftobdf" is a public software utility for converting SNF (Server Normal Format) fonts into the BDF (Bitmap Distribution Format) fonts. It's UNIX-based, and runs at the X client end. Basically, you may convert SNF fonts on a UNIX-based X11 client host, and transfer them to a Macintosh OS computer. Then under MacX, you can use the Font Director facility to compile the BDF fonts into the X fonts that the MacX server can use.

For more detailed information on how to compile BDF files within MacX, see page 101 of Apple MacX User's Guide, "Compiling fonts from BDF files."

You can find a copy of snftobdf on AppleLink.

DOS PC-to-LaserWriter IIf,IIg: Troubleshootg Print Problem(3/94)

Revised: 3/10/94
Security: Everyone

DOS PC-to-LaserWriter IIf,IIg: Troubleshootg Print Problem(3/94)

==========

Article Created: 9 March 1992
Article Reviewed/Updated: 10 March 1994

TOPIC ----------

We have a Macintosh LC and an AST Premium II (386-PC compatible) connected to an Apple LaserWriter IIf. We have no problem printing from the Macintosh to the LaserWriter, but we can't print from the AST to the LaserWriter.

We added these mode statements to the autoexec.bat:

```
mode com1:9600,n,8,1
mode lpt1:=com1:
```

which redirects the print command to com1.

When we tried to print screen, nothing happened. When we tested with CheckIt (PC diagnostics), we got a print error.

We tried to print from WordPerfect 5.1 using HP emulation, and it won't print. We set the printer select switch to 1 and ran the self-test, which showed RS-232C, 9600, Raw Input. We had a cable made to the specifications in the Tech Info Library article titled "LaserWriter IINT to IBM PC: Pinouts for DB-25 Connection. We tried it both with HW handshaking (DTR) and SW handshaking (XON/XOFF) -- WordPerfect 5.1 has a setup for XON/XOFF, and we set it to on.

Can you help us troubleshoot the problem?

DISCUSSION ----------

Are you sending PostScript or HP emulation? For both the Macintosh and the PC to be connected at the same time, both have to send PostScript to the printer. The printer cannot switch between HP emulation and PostScript on the fly.

This configuration requires the printer select switch to be set to either 0 or 5.

Here's a test you can run to determine if this is a hardware or software problem:

1) Turn off the printer and set the select switch to 1 (HP LaserJet Emulation).

2) Ensure that you are using a Null Modem Cable.

3) Issue the appropriate Mode Commands:

   Mode Com1: 96,8,1,n,p

   Mode LPT1: = Com1:

4) Issue a CTRL-P. This redirects the screen output to the list device.

5) Perform a few DIR commands. You should see the light on the LaserWriter blink.

6) Issue a CTRL-L. This sends a form feed to the printer and ejects the page.

7) Issue a CTRL-P. This redirects the output back to the screen.

If the keyboard hangs or the light doesn't blink during this procedure, you have a hardware problem. The likely causes are the cable, the serial port on the IBM, or the logic board on the printer.

If you get output, the problem is most likely in software. Check the configurations of the applications you are using on the PC side.

Note that this only tests the hardware configuration. You should set the printer back to PostScript, so that the Macintosh can print to it.

RAM: Faster-than-Required SIMMs Don't Improve Performance

==========

Article Created: 11 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Will performance on my Macintosh Quadra 700 increase if I use SIMMs rated at 60 ns instead of the recommended 80 ns?

DISCUSSION ----------

Performance will not increase if you install SIMMs rated at 60 ns in a Macintosh Quadra because the SIMMs still will be accessed at the 80-ns rate.

A problem with incorrect SIMM speeds is encountered when the SIMMs are too slow for the system in which they are installed. For example, if you put 120-ns SIMMs in a system that requires 80-ns SIMMs, the CPU accesses the 120-ns SIMMs at the faster 80-ns rate. This causes those slower SIMMs to overheat, produce random errors, and eventually fail completely.

Personal LaserWriter NTR: Specs (Discontinued 9/93)

Revised: 9/13/93
Security: Everyone

Personal LaserWriter NTR: Specs (Discontinued 9/93)

==========

Article Created: 23 March 1992
Article Reviewed/Updated: 10 September 1993

TOPIC ----------

This article gives technical specifications for the Personal LaserWriter NTR.

DISCUSSION ----------

Marking Engine

- Canon LBP-LX laser-xerographic

Controller

- AMD29005 16 MHz CPU

Memory

- 3MB ROM
- 3MB RAM (standard 72-pin, 80ns SIMMs, CAS before RAS), upgradable to 4 MB

Throughput

- 4 pages per minute

Page Description Language

- Adobe PostScript Level 2

Emulation

- HP PCL 4 (emulates HP LaserJet IIP)

Print Resolution

- 300 dots per inch

Interfaces

- RS-422/423 8-pin circular mini DIN
- RS-232C 25-pin 'D' shell connector
- Centronics 36-pin (parallel)

Recommended Duty Cycle

- Minimum 150,000 pages, with no monthly page limit (equivalent to 200 pages/day, 5 days/week for 5+ years).

Paper Feed

- Manual or automatic with the multipurpose tray (70 sheets or 7 envelopes).
- Optional 250-sheet automatic feed paper cassette

Print Materials

- Media
  Apple recommends 20-lb (75g/m2) photocopy or typewriter bond in normal mode. You can use 16-lb (60g/m2) to 28-lb (105g/m2) paper. Accepts medium weight photocopier transparencies. Envelopes can be fed through the multi-purpose tray or from the optional envelope cassette.
- Sizes
  - Paper: U.S. letter, U.S. legal, A4, B5 cassettes - each cassette holds 250 sheets of 20 (75g/m2) lb paper.
  - Envelopes: Envelope cassette holds 15 envelopes. Use envelopes between the following sizes:
    - minimum 3.8 x 7.25 inch (96 x 184 mm)
    - maximum 7.4 x 10 inch (188 x 255 mm)
- Printable Surface
  - Maximum printable line: 8.1 inches (205.9 mm)
  - Minimum top and bottom margins: .235 inches (6.0 mm)
  - Minimum left and right margins: .197 inch (5.0 mm)
  - The actual printable area may vary depending on the application and the amount of RAM installed.

Size and Weight

- Height: 9.8 inches (24.8 cm)
- Width: 15 inches (38 cm)
- Depth (with optional letter-size cassette): 18.3 inches (46.4 cm)
- Weight: 29.5 lb. (13.35 kg)

Operating Environment

- Temperature: 50 degrees to 90 degrees F (10 degrees to 32.5 degrees C)
- Humidity: 20% to 80%

Power Requirements

- U.S./Japan: 90 to 110 volts AC, 48-52Hz, 58-62 Hz
- Europe/Australia: 220 to 240 volts AC, 48-52 Hertz

Power Consumption

- Operating
  - 600 watts maximum at 115 volts
  - 550 watts maximum at 220 volts

Article Change History

09/10/93 - UPDATED
• Discontinued on 9/7/93
09/14/92 - REVIEWED
• For technical accuracy.
09/14/92 - UPDATED
• Memory upgrade section to show it's expandable to 4 MB.

Personal LaserWriter NTR: Description (Discontinued) (10/94)

Revised: 10/3/94
Security: Everyone

Personal LaserWriter NTR: Description (Discontinued) (10/94)

==========

Article Created: 23 March 1992
Article Reviewed/Updated: 3 October 1994

TOPIC ----------

This article describes the Personal LaserWriter NTR.

DISCUSSION ----------

The Personal LaserWriter NTR combines a high-speed RISC processor and multi-platform ease of use. It delivers 3 to 5 times the performance of the Personal LaserWriter NT.

You can upgrade the Personal LaserWriter SC and NT to the NTR with a controller board upgrade.

Features

- The Personal LaserWriter NTR uses the 4 ppm (pages per minute) Canon P-110 engine common to all of Apple's Personal LaserWriter product line.

- It uses the standard Personal LaserWriter toner cartridge (part # M0089LL/A). This toner cartridge has an expected life of about 3500 pages of normal coverage.

- 70-sheet paper tray, second 250-sheet tray optional
  It uses the following standard LaserWriter II paper cassette options when equipped with the optional 250-sheet cassette base (part# M8028G/A):

  - Letter cassette (part # M0091LL/A)
  - Legal cassette (part # M0302LL/A)
  - Envelope cassette (part # M0094LL/A)

- RISC Processor (AMD 29005)

- Parallel, LocalTalk and serial interfaces

This is the first Apple LaserWriter to feature a Centronics parallel port for easy connectivity to DOS/Windows PCs.

- All ports active
  The printer arbitrates connections between its three communications ports, allowing each to be physically connected to different sources concurrently.

- 39 font faces
  Adobe Type 1 fonts in ROM, and their TrueType equivalents available on floppy disk.

- PostScript Level 2
  Enhanced PostScript offers improved performance thanks to data compression and more extensive use of data caching.

- TrueType and Type 1 support (in ROM)
  The TrueType Scaler is in ROM for optimum TrueType font performance.

- HP IIP (PCL 4+) emulation

- 3MB RAM standard, expandable to 4MB
  The NTR ships with 3MB of DRAM, sufficient for the great majority of printing applications. You can upgrade to 4MB by replacing the removable 1MB SIMM with a 2MB SIMM. (Personal LaserWriter NTR supports industry-standard 80ns or faster, 72-pin 2 MB SIMMs, CAS before RAS.)

Benefits

- Quick first page output

- True multi-platform compatibility: Macintosh, DOS/Windows, and OS/2

- Enhanced ease of use in multi-platform, especially Macintosh and PC, environments. All interfaces are simultaneously active. No more changing dip switches or thumbwheel settings.

- Enhanced font selection

- Paper handling capabilities expand with user's needs. With second tray installed, convenient access to different types of paper such as letterhead and bond.

- Latest version of PostScript, providing enhanced performance and functionality

- Ensures compatibility and maximum quality with user's fonts.

- Compatibility with non-PostScript applications

- Sufficient RAM for processing complex pages (includes legal size printing); expandable for faster printing with more fonts.

Article Change History:
03 Oct 1994 - Corrected part number on paper tray.
15 Sep 1992 - Included more specifics on the type of memory upgrade.

Personal LaserWriter NTR: Communication Arbitration

Revised: 3/19/92
Security: Everyone

Personal LaserWriter NTR: Communication Arbitration

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

The Personal LaserWriter NTR has three communication ports that can be active simultaneously. Special arbitration logic controls the activity among the three ports.

DISCUSSION ----------

Because PostScript processes one job at a time, only one port can have access to the printer at any given time. Arbitration logic polls the ports in a round-robin fashion until it senses activity in one of the three ports. It terminates polling at connection and the beginning of job execution. A connection, in this sense, refers to the dedication of the printer to a communication port while receiving PostScript jobs from a host. AppleTalk ports may process multiple jobs during a single connection while the other serial port connections have only one job. Receiving an EOF (end-of-file indicated end-of-job) character terminates a non-AppleTalk connection.

The port arbitration cycle begins whenever a host terminates a connection. It determines polling order by always polling the port that has gone unpolled for the longest time. This procedure ensures that one port won't dominate the printer. If an active PostScript job opens a port directly, that port is excluded from arbitration until the job closes it again. A PostScript job opening a serially connected sheet feeder is an example of this type of port activity.

All three ports respond to status request, with current printer status, unless excluded from the port arbitration cycle as previously explained, or just configured inactive. Directly opened ports may either respond with stale status or not respond at all. Ports not arbitrated due to

configuration may not respond or even appear on the network.

Personal LaserWriter NTR: Utility Software 7.2

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Utility software, version 7.2, used with the Personal LaserWriter NTR.

DISCUSSION ----------

The LaserWriter Utility software provided with the Personal LaserWriter NTR is a slightly revised version of the utility that shipped with the LaserWriter IIf and IIg. The updated version includes some bug fixes and some minor changes to handle port configuration. These are the supported functions:

- Disable Start
  You can disable/enable the printing of the page Start Page when you turn the printer on.

- Configuration
  You can set the parameters for user-defined switch settings (emulation, baud rate, data length, hand shaking, port, and cut sheet feeder).

- Naming
  You can change the printer's name.

- Download Fonts
  You can download PostScript and TrueType fonts to DRAM.

Macintosh LC II: Connecting a VGA Monitor

Revised: 3/19/92
Security: Everyone

Macintosh LC II: Connecting a VGA Monitor

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What are the pinouts for connecting a VGA monitor to the Macintosh LC II computer?

DISCUSSION ----------

To recognize a VGA monitor, you must wire pins 10 and 7 together. Since Macintosh LC II always grounds ID bit 2, this wire will cause ID3 to be grounded and will make the VGA ID appear.

Macintosh LC DB-15		VGA Connector
2	Red Video	1
1	Red Ground	6
9	Blue Video	3
13	Blue Ground	8
5	Green Video	2
6	Green Ground	7
15	Hsync	13
12	Vsync	14
14	Sync Ground	10
10		
7	Connect 7 and 10 so the sense pin ID will equal VGA	

A few issues to keep in mind:

- VGA monitors may vary, depending on the vendor. Check with the vendor about Macintosh LC II compatibility before buying.

- Vendors have different image quality specifications. There may be significant differences between Apple monitors and VGA monitors. Do a side-by-side comparison of a VGA monitor with an Apple monitor before buying.

- When a VGA monitor is connected as described in the pinout above, the resolution is 640 x 480. The bit-depth supported depends on the amount of VRAM installed. For example, if a 256K VRAM SIMM is installed, 4-bit color (16 colors) is supported. If the 512K VRAM SIMM is installed, 8-bit (256 colors) is supported.

Macintosh LC II: RAM Configuration and 10 MB Limit (7/96)

Revised: 7/2/96
Security: Everyone

Macintosh LC II: RAM Configuration and 10 MB Limit (7/96)

==========

Article Created: 23 March 1992
Article Reviewed/Updated: 2 July 1996

TOPIC ----------

Is there a technical reason for the 10 MB limit on RAM for the Macintosh LC II and Performa 400, 405, and 430 computers?

DISCUSSION ----------

The Macintosh LC II and Performa 400, 405, and 430 computers have 4 MB of DRAM soldered onto the logic board. In addition, there are two 30-pin SIMM slots that accept 1, 2, and 4 MB SIMMs, which results in 4, 6, 8, and 10 MB configurations. SIMMs should be fast-paged mode, 100 nanoseconds (ns) RAM access time, or faster.

Although you would physically have 12 MB of DRAM installed in the computer if you populated each SIMM slot with 4 MB SIMMs, the total amount of addressable RAM is limited to 10 MB. As a result, when you populate your board with two 4 MB SIMMs, the lower 2 MB of DRAM on the logic board cannot be accessed.

This 10 MB addressable RAM limit on these computers is because the hardware only uses 24 address lines to select addresses, regardless whether it is in 24- or 32-bit mode. This means the hardware can access only $xx00 0000 - $xxFF FFFF, or 16 MB of address space. The hardware ignores the upper 8 bits of the address.

A distinction must be made between what the hardware looks at and what the software looks at. In 32-bit mode the software looks at all 32 bits of the address, but when the software tries to read a value from the memory location $40A0 0000, for example, the hardware, ignoring the upper 8 bits of this address, reads a value from $00A0 0000 instead.

In addition, since the ROM is mapped by the hardware to $00A0 0000 in both 24- and 32-bit modes and RAM needs to be contiguous, the largest contiguous amount of memory is from 0 -$9F FFFF, which is 10MB.

TOPIC ----------

This article describes the AppleCD 150 drive.

DISCUSSION ----------

AppleCD 150 is a cost-reduced revision of the existing AppleCD SC Plus drive. It uses a different enclosure instead of the traditional Apple plastic box. By making this change, we provide the same functionality and performance as the existing product, but at a much lower price.

Features

- 150KB per second
- Supports Macintosh HFS, ISO 9660/High Sierra file formats
- 380 ms average access time
- 64K cache memory
- Front-loading caddy door
- Automatic lens cleaning mechanism
- QuickTime ready
- SCSI interface

Benefits

- Fast data transfer
- Access to large number of titles
- Quick access to information
- Improved reliability
- Improved dust protection
- Can access video data
- Easy Macintosh connection, plug and play

Macintosh LC II: Software Compatibility

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Are there any software compatibility problems with the Macintosh LC II?

DISCUSSION -----

Software compatibility test results show no new software compatibility problems.

Some cards need latest drivers:

- The LC Ethernet card requires a ROM revision (Service upgrade).

- The Apple IIe card requires 2.1 driver (on networks, and so on).

An expansion card compatibility list ships in the Macintosh LC II box. This list indicates the versions required to run properly on the Macintosh LC II. Since we found no new software compatibility problems, no software compatibility list will be included.

Security: Everyone

Macintosh LC II: Doesn't Support 65.5K Colors

==========

Article Created: 23 March 1992
Article Last Reviewed: 13 April 1992
Article Last Updated: 13 April 1992

TOPIC ----------

Why doesn't the Macintosh LC II support 2^16 (= 65.5K, or 65,536) colors?

DISCUSSION ----------

All video timing modes use a 256 x 24 Color Look-Up Table (CLUT). Monochrome mode also uses the CLUT, driving the R, G, and B with the same signal. When you select the thousands of colors mode in the monitor CDEV, you are selecting 16 bit/pixel format. The 16 bit/pixel assigns the uppermost bit to an Alpha Channel and 5 bits each for Red, Green, and Blue.

Selecting thousands mode divides the 256 x 24 CLUT into three 32 x 8 tables, allowing display of 32 levels of each color from a selection of 256. The 555 data is applied to each of these tables, resulting in 888 output values. The CLUT is used so that gamma correction can be applied, even in the direct color mode. Therefore, you will get 2^16-1 = 32^3 = 32.7K color selections from a palette of 2^24 = 16.7 million color choices.

Security: Everyone

Macintosh LC II: Description (Discontinued)

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Macintosh LC II computer.

DISCUSSION ----------

The Macintosh LC II has a 68030 processor running at 16MHz, providing up to 10% faster performance than the Macintosh LC.

The ROM (Read-Only Memory) contains operating system routines, Toolbox routines, and system traps. The memory mapping scheme allocates 2MB of address space for ROM. The Macintosh LC II configuration consists of four 128K x 8 ROMs using 512K of the allocated address space. The Macintosh LC II ROM is an LC ROM (based on IIci ROM) upgraded to take advantage of the 68030.

Features

- Virtual Memory support
- 16-bit data path
- 32-bit clean ROM (512K)
- No Apple Floating Point Unit (FPU). Third-party solutions available.
- One 1.4MB FDHD SuperDrive
- hard drive options: none, 40MB, or 80MB
- LC Processor Direct Slot (PDS). Works with Apple IIe, LC Ethernet, and third-party LC cards.
- Built-in video RAM
  - 256K VRAM SIMM option
    - 16 grays on Macintosh 12-inch Monochrome or VGA
    - 256 colors on Macintosh 12-inch RGB Display
    - 16 colors on 13-inch AppleColor High-Resolution RGB Monitor or VGA

  - 512K VRAM SIMM option
    - 256 grays on Macintosh 12-inch Monochrome or VGA
    - 32,000 colors on Macintosh 12-inch RGB Display
    - 256 colors on 13-inch AppleColor High-Resolution RGB Monitor or VGA
- 4MB RAM soldered on logic board
- 2 SIMM RAM expansion slots (expansion to 6, 8, or 10MB)
- Ports (ADB, Printer, Modem, Video, SCSI, Mono sound out, Sound In)
- Built-in sound
  - Monaural 8-bit A/D converter with 22 kHz sampling rates
  - Electret microphone
- Macintosh LC to Macintosh LC II Upgrade Kit

System Software

Macintosh LC II systems with no hard drive are shipped with System 6.0.8.

Macintosh LC II systems with hard drives ship with System 7.0.1 and the System 7 Tune-Up extensions.

Worldwide Configurations

- USA
  - 4MB RAM, floppy drive only, 256K VRAM (M1720LL/A) - education only
  - 4MB RAM, 40MB hard drive, 256K VRAM (M1701LL/A)
  - 4MB RAM, 80MB hard drive, 512K VRAM (M1707LL/A)

- Europe and Pacific
  - 4MB RAM, 40MB hard drive, 512K VRAM, with or without keyboard
  - 4MB RAM, 80MB hard drive, 512K VRAM, with or without keyboard

Copyright 1992-1994, Apple Computer, Inc.

Macintosh LC II: Specifications (Discontinued 3/93)

==========

Article Created: 23 March 1992

TOPIC --------------------

This article gives technical specifications for the Macintosh LC II computer.

DISCUSSION --------------------

Processor

- MC68030, 32-bit architecture, 15.6672 megahertz (MHz) clock frequency (includes built-in memory management unit).

Memory

- 4MB RAM, expandable to 10MB
- 512K of read-only memory (ROM)
- 256 bytes of parameter memory (PRAM)

Video RAM

- 256K video RAM (VRAM), upgradable to 512K
- With 256K video RAM, these video modes are supported:
  - 512 x 384 pixels with 1, 2, 4, and 8 bits per pixel
  - 640 x 480 pixels with 1, 2, and 4 bits per pixel
- With 512K video RAM, these video modes are supported:
  - 512 x 384 pixels with 1, 2, 4, 8, and 16 bits per pixel
  - 640 x 480 pixels with 1, 2, 4, and 8 bits per pixel

Disk Drives

- Built-in Apple SuperDrive 1.4MB high-density floppy disk drive
- Internal SCSI hard disk drive (several capacities available; optional if you're upgrading)
- Optional external SCSI hard disk drives (several capacities available)

Sound Generator

Custom sound chip, including mono sampling generator capable of driving stereo miniature phone jack headphones, or stereo equipment by sending the same output into each channel.

Power Input

- Line voltage: 100-240 volts AC, RMS automatically configured
- Frequency: 50-60 Hz ±3 Hz single phase
- Power: 50 watts maximum, not including monitor power

Clock/Calendar

CMOS custom chip with long-life lithium battery

Interfaces

- One Apple Desktop Bus port supports a keyboard, mouse, and other devices daisy-chained through a low-speed, synchronous serial bus (maximum of three chained devices)
- Two serial (RS-232/RS-422) ports, 230.4 kilobits per second maximum (up to 0.920 megabits per second if clocked externally)
- SCSI interface
- Video port supports RGB and monochrome monitors of various sizes and resolutions
- Internal expansion slot for processor-direct expansion card
- Sound output port capable of delivering monophonic sound to both channels of a stereo device
- Sound input port for monaural sound input

Monitors

- Supports the following monitors:
  - Macintosh 12-inch RGB Display
  - Macintosh 12-inch Monochrome Display
  - AppleColor High-Resolution RGB Monitor

Keyboards

Supports all Apple Desktop Bus (ADB) keyboards

Mouse

ADB mouse: either mechanical tracking, optical shaft, or contact encoding

Apple Desktop Bus Power Requirements

- Maximum power draw for all ADB devices: milliamperes (mA)
- Mouse draws 80 mA
- Keyboard draws 25-80 mA (varies with the keyboard model used)

Note: Up to three ADB devices can be daisy-chained to the ADB port.

RAM Configurations

RAM in the Macintosh LC II is provided both on the logic board and in packages called Single In-line Memory Modules, or SIMMs. The SIMMs contain dynamic RAM chips on a single circuit board, with electrical "finger" contacts along one edge that plug into the SIMM sockets on the computer's logic board.

Macintosh LC II can work with any of several RAM configurations, depending on the density of the RAM chips that are mounted on the SIMMs. The Macintosh LC II can use only 1, 2, or 4MB RAM SIMMs. Don't purchase 256K SIMMs for use with the Macintosh LC II. Possible RAM configurations include 4, 6, 8, and 10MB.

Important: Macintosh LC II SIMMs should be fast-paged mode 100 nanoseconds (ns) RAM access time or faster. The slower 120 ns and 150 ns SIMMs available for some other models of Macintosh computers DO NOT work in the Macintosh LC II.

Microphone/Sound

The microphone is an electret type, omnidirectional microphone that is powered by the computer. Microphone output voltage is 4 millivolts (mV) peak-to-peak at normal speaking volume.

Note: You can also use adapters to input sound from audio equipment with line level outputs, but the line level signals must be attenuated before reaching the computer's sound input port. An attenuation of 500:1 is recommended when inputting line level signals. Appropriate attenuation cables and adapters are available from electronics stores.

Size and Weight

- Main Unit
  Weight: 8.8 lb. (4.0 kg)
  Height: 3.0 inches (77 mm)
  Width: 12.2 inches (310 mm)
  Depth: 15.0 inches (382 mm)
- Mouse
  Weight: 6 oz. (0.17 kg)
  Height: 1.1 inches (27.9 mm)
  Width: 2.1 inches (53.3 mm)
  Depth: 3.8 inches (96.5 mm)
- Keyboard
  Weight: 2 lb. (1 kg)
  Height: 1.8 inches (44 mm)
  Width: 16.5 inches (418 mm)
  Depth: 5.6 inches (142 mm)

Environment

- Operating temperature
  10 degrees C to 40 degrees C (50 degrees F to 104 degrees F)
- Storage temperature
  –40 degrees C to 47 degrees C (–40 degrees F to 116.6 degrees F)
- Relative humidity
  0% to 80% (noncondensing)

Altitude
  0 to 3048 m (0 to 10,000 ft.)

Macintosh LC II: Video (7/93)

Revised: 7/12/93
Security: Everyone

Macintosh LC II: Video (7/93)

==========

Article Created: 23 March 1992

Article Change History

07/12/93 - REVISED
- To include Performa

TOPIC ----------

This article describes the video capabilities and expansions available for the Macintosh LC II, and Performa 400, 405 and 430.

DISCUSSION ----------

Macintosh LC II comes with either a 256K or 512K VRAM SIMM. The VRAM is installed in a 32-pin SIMM slot. There are three possible SIMMs you can use:

- NO VRAM (a SIMM containing two transparent latches)
  - monochrome on Macintosh 12-inch Monochrome Display
  - monochrome on 13-inch AppleColor High-Resolution RGB Monitor
  - monochrome on VGA
- 256K VRAM SIMM option (Performa 405)
  - 16 grays on Macintosh 12-inch Monochrome or VGA
  - 256 colors on Macintosh 12-inch RGB Display
  - 16 colors on 13-inch AppleColor High-Resolution RGB Monitor or VGA
- 512K VRAM SIMM option (Performa 400 and 430)
  - 256 greys on Macintosh 12-inch Monochrome or VGA
  - 32,000 colors on Macintosh 12-inch RGB Display
  - 256 colors on 13-inch AppleColor High-Resolution RGB Monitor or VGA

Timing Modes

The Macintosh LC II supports the following four video timing modes:

Resolution	Supported	Vertical	Horizontal	Bandwidth
512 x 384	Macintosh 12-inch RGB	60.15	24.48	15.67
640 x 480	Macintosh 12-inch Monochrome AppleColor 13-inch	66.62	34.98	31.33
540 x 384	Macintosh 12-inch RGB Macintosh 12-inch Monochrome AppleColor 13-inch	60.15	24.48	17.23
VGA		59.94	31.47	25.18

All video timing modes use a 256 x 24 Color Look-Up Table (CLUT). Monochrome mode also uses the CLUT, driving the R, G, and B with the same signal. When you select "thousands of colors" in the Monitors control panel, you're selecting 16 bit/pixel format. The 16 bit/pixel assigns the uppermost bit to an Alpha Channel and 5 bits each for Red, Green, and Blue. Selecting thousands mode divides the 256 x 24 CLUT into three 32 x 5 tables. Therefore, you get 2^15 = 32^3 = 32.7K color selections.

Monitor Video Connectors

Macintosh LC II uses a DB-15 female connector to connect to the video monitor. Here's the pin-out:

Pin	Signal	Description
1	RED.GND	Red Video Ground
2	RED.VID	Red Video
3	CSYNC~	Composite Sync.
4	MON.ID1	Monitor ID, Bit 1
5	GRN.VID	Green Video
6	GRN.GND	Green Video Ground
7	MON.ID2	Monitor ID, Bit 2
8	nc	(No Connection)
9	BLU.VID	Blue Video
10	MON.ID3	Monitor ID, Bit 3
11	CSYNC.GND	CSYNC Ground
12	VSYNC~	Vertical Sync.
13	BLU.GND	Blue Ground
14	HSYNC.GND	HSYNC Ground
15	HSYNC~	Horizontal Sync.
Shell	S.GND	Chassis Ground

Three of the 15 pins (pin 10, 7, and 4) are used to send a signal to identify the monitor type. Once identified, Macintosh LC II synchronizes the correct video timing.

The monitor IDs are:

Connector pins	10,7,4
Monitor ID bits	321
Macintosh 12-inch Monochrome	110
Macintosh 12-inch RGB Display	010
Apple IIe mode	010
AppleColor 13-inch RGB	110
VGA	011
No Monitor	111

When no monitor (111) is attached, 512 x 384 video timing is selected. Macintosh LC II performs a special function of always returning a 1 to the Monitor Parameters Register when reading Monitor ID bit 2. By performing this special function, various monitors can select the correct video timing schemes. The VGA monitor (011) has the same monitor ID as the two-page monochrome. Neither the Two-Page nor the Portrait monitor can be attached to Macintosh LC II.

Macintosh LC II: Virtual Memory

Revised: 3/19/92
Security: Everyone

Macintosh LC II: Virtual Memory

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

The Macintosh LC II supports a demand paged virtual memory environment -- a distinct advantage over its predecessor, the Macintosh LC. The 68030 microprocessor comes equipped with the MC68851 PMMU (page memory management unit).

DISCUSSION -----

Addressing Scheme

The Macintosh LC II can generate either 24-bit or 32-bit virtual addresses.

The 24-bit mode allows a total of 11MB virtual memory. In 24-bit mode the total addressing space is 16MB. In this address space, 2MB is reserved for ROM, 1MB for I/O, 1MB for video, and 1MB is just reserved for a total of 5MB used in this 16MB space. The PDS slot also takes up 1MB. So when a card isn't installed, virtual memory can use this space. With a PDS card present, 10MB of virtual memory is available.

In 32-bit mode, because the ROM is 32-bit clean (that is, the ROM code has the ability to use the full 32 bits of address space), the total addressing space is 232, or 4 gigabytes. Of this 4 gigabytes, 3 gigabytes is used for ROM, I/O, slot space, and expansion, leaving a maximum of 1 gigabyte for virtual memory.

Virtual Memory

With the Macintosh LC II, limited RAM expandability and the cost of RAM SIMMs makes virtual memory an attractive option. Virtual addressing allows the Macintosh LC II to address data on a disk drive as if it were in main

memory. That means that you can launch more applications and data on the Macintosh LC II than the amount of installed RAM can contain.

The 68030 and its PMMU provide the hardware support for virtual memory. PMMU performs memory paging, a technique where a needed page of memory is transferred (swapped) into main memory from the disk. In addition, the PMMU swaps out of main memory, a page that isn't currently needed. The PMMU keeps track of 64 pages in memory.

With 32-bit addressing on and enough space available to allocate on hard disk, you can create a very large virtual memory address space. However, it's best for performance reasons to limit the size of your virtual memory to twice the size of installed RAM. By limiting the size of your virtual memory, you'll help eliminate excessive paging activity known as thrashing.

Macintosh LC II: Not Capable of Running A/UX

Revised: 3/19/92
Security: Everyone

Macintosh LC II: Not Capable of Running A/UX

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Can the Macintosh LC II run A/UX 3.0?

DISCUSSION ----------

No, the Macintosh LC II cannot run A/UX, which puts heavier demands on hardware resources than the Macintosh operating system does.

The Macintosh LC II is not a suitable A/UX platform for the following reasons:

- The Macintosh LC II lacks an FPU.

- It has limited RAM expansion and internal hard disk space.

- It has a 16-bit data path.

Macintosh LC II: How It Differs from Macintosh LC

==========

Article Created: 23 March 1992
Article Last Reviewed: 23 July 1992
Article Last Updated:

TOPIC -----

This article lists the ways the Macintosh LC II differs from the Macintosh LC.

DISCUSSION -----

- Processor: 68030 (instead of 68020)
- 4MB RAM minimum soldered onto the logic board.
- No second floppy-disk drive
- Improved VGA support (multisync).
- ASIC changes
  - 030 support (related to data cache use)
  - 4MB RAM on board support
  - ROM space reduced to 2MB (from 4MB); allows 2MB for cards
  - LOR (low-res special effect/pixel doubler)
- Removed speaker/fan plastic assembly.
- Removed second floppy connector.
- Reduced voltage sensitivity for VGA conformance.

Macintosh LC II: No NTSC Video Out

Revised: 3/19/92
Security: Everyone

Macintosh LC II: No NTSC Video Out

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Why doesn't the Macintosh LC II have NTSC video out?

DISCUSSION -----

NTSC video, unlike standard composite, is based on half-lines, not full lines of video. Standard Macintosh video starts at the top LEFT of the screen. The Macintosh then increments down the screen one line at a time, ending the scan at the bottom right. The NTSC scan starts at the top and MIDDLE of the screen, counts down every other line, and then ends only halfway across the screen on the bottom, again in the MIDDLE of the screen.

Now, the problem is that the current Macintosh LC and LC II video architecture is based on routines with the basic unit as one full line across. In order to do NTSC, the Macintosh LC II video architecture would have to understand half-lines.

The Macintosh Display Card 4•8 and 8•24 use a completely programmable timing logic, which can do NTSC timing quite easily. However, to implement this logic on the Macintosh LC II logic board would require 3 to 5 thousand more gates on video ASIC, which are just not available in the current package. Additional video circuitry would be required.

Macintosh LC II: No Support for 16 or 21 Monitors (2/93)

Revised: 3/9/93
Security: Everyone

Macintosh LC II: No Support for 16" or 21" Monitors (2/93)

==========

Article Created: 23 March 1992

Article Change History

02/26/93 - UPDATED
- To include information on products that provide larger monitor support.

TOPIC ----------

Can the Macintosh LC II support the Apple Macintosh Portrait Display, Macintosh 16" Color Display, Apple 21-inch Two-Page Monochrome Monitor, or the Macintosh 21" Color Display?

DISCUSSION ----------

The Apple Macintosh Portrait Display, Macintosh 16" Color Display, Apple 21-inch Two-Page Monochrome Monitor, and the Macintosh 21" Color Display are not directly supported on the Macintosh LC II.

Like the Macintosh LC, Macintosh LC II supports four different resolutions:
- 512 x 384
- 640 x 480
- 560 x 384 (Apple II resolution)
- VGA

The Apple Macintosh Portrait Display resolution is 870 x 640.
The Macintosh 16" Color Display resolution is 832 x 624.
The resolution on the 21-inch displays is 1152 x 870.

The Macintosh LC II on-board video is the same as the LC. The Macintosh LC II supports 256 colors on the 12-inch, and 16 colors on the 13-inch monitor.

There are third-party products that can provide the Macintosh LC and LC II with the capability of driving the larger monitors. Two such companies are Lapis and Aura Systems. You can find more information on these companies by searching on their names in the Technical Information Library and in the Redgate Products Library.

Macintosh LC II: RAM Expansion (7/93)

==========

Article Created: 23 March 1992

Article Change History

07/12/93 - REVISED
- To include Performa

TOPIC ----------

When 4MB RAM resides on the logic board, how do I populate the two SIMM slots to get 10MB in the Macintosh LC II or Performa 400, 405, and 430?

DISCUSSION ----------

In the case of 4MB soldered on the printed circuit board (PCB), you need an 8MB RAM expansion kit to get 10MB. This configuration has 12MB of RAM present in the system. However, the Memory Map reserves only the first 10MB of address space for RAM. Therefore, the lower 2MB on the PCB can't be accessed when a 4MB base system is fully expanded. Even though, 32-bit addressing allows up to 1GB address space for RAM, there are only 24 address lines. Hence Macintosh LC II can see only 10MB of physical RAM.

230MB 3.5-inch SCSI Hard Disk Drive: Description

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

This article describes the Apple 230MB 3.5-inch SCSI hard disk drive.

DISCUSSION -----

This hard disk drive is intended for use in Apple's high-performance computer systems, and has features that benefit these particular products because of their exceptional speed and performance.

This drive operates from +12V and +5V supplies, but MAY REQUIRE POWER SAVING MODES. Side holes machined within the hard disk assembly chassis are for mounting the drive. The SCSI interface provides hardware-detectable SCSI ID.

The drive firmware contains on-board start-up diagnostic routines as well as automatic error correction during normal operation. Servo position control "locked" to the data track of interest provides on-track error performance. When turned on, the drive releases the actuator arm assembly from its locked position (landing zone) only if the read/write heads are in a stable flying condition. This feature ensures no direct physical contact between the heads and the data area on the disk surfaces. If power suddenly shuts off, the actuator arm automatically retracts to the landing zone before the heads make contact with the disk surfaces, and remains locked in place until power returns.

Ofoto for Windows: Description

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the differences between Ofoto for Windows -- the software that accompanies Apple OneScanner for Windows -- and Ofoto for Macintosh. It also outlines the product's file formats and system requirements.

DISCUSSION ----------

Differences Between Ofoto for Windows and Ofoto for Macintosh
---
Ofoto for Windows, like Ofoto for Macintosh, was developed by Light Source Inc. It is nearly identical to Ofoto for Macintosh 1.1, except that it does not support QuickTime compression, and can run without a scanner present.

These are the other differences:

- The eraser, pencil, and lasso tools have been removed.

- Revert and Scan Orientation have been removed.

- The Windows MDI (Multi-Document Interface) metaphor is used. There is a title bar over the menu bar for the application, with any number of images open within the application.

- A single-line window at the bottom of the application describes menu commands that are being selected with the mouse.

- The Tool bar is a separate floating window not attached to the image windows.

- You can tell if an image is dirty (needs to be saved) if the upper-left and lower-right corners "bubble" out.

- Operations that use the Option key and mouse on the Macintosh use the Shift key under Windows. Two examples: using Shift with the mouse to crop an image, and using Shift with the mouse to zoom out.

- When Ofoto is run without a scanner, the functions that pertain to scanning are grayed out.

- Printer Setup takes the place of the Macintosh version's Page Setup.

- When you save a file in Ofoto, an auxiliary data file with an extension of the form OF? is also written to disk. This file is useful only if you intend to the read the image back into Ofoto. (On the Macintosh, this information is part of the resource fork, which doesn't exist in the DOS file system.)

  The "?" in the extension "OF?" can be any of these:
  - M (Microsoft Paint)
  - B (Windows Bitmap)
  - P (PC Paintbrush)
  - I (GEM Image)
  - T (TIFF)
  - E (Encapsulated Postscript)

File Formats

Ofoto for Windows reads the following file formats:

- TIFF
- EPS
- PC Paintbrush (PCX)
- GEM Image (IMG)
- Windows Bitmap (BMP)
- Microsoft Paint

System Requirements

Ofoto for Windows requires:

- Microsoft Windows 3.0 (standard or enhanced mode only, real mode not supported)

- MS-DOS 3.3 or greater (5.0 recommended)

- VGA 640 x 480 resolution, 12MHz 286 or faster (386 or 486 preferred)

- 4MB RAM

- Hard disk with at least 10MB available

- Microsoft mouse or compatible

OneScanner for Windows: Using Its SCSI Card with Other Devices

Revised: 3/26/92
Security: Everyone

OneScanner for Windows: Using Its SCSI Card with Other Devices

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

The SCSI card bundled with Apple OneScanner for Windows can be used with other SCSI devices, such as a hard drive. Note: Apple does not support other SCSI configurations, cards, or devices.

To use the card with a SCSI device other than OneScanner, you need the driver software that is available from Adaptec, the card's manufacturer.

DISCUSSION ----------

Using the SCSI card for other devices can be tricky. Sometimes SCSI IDs must be set with a jumper on the card and the software must be reconfigured to use another address for the card.

Similarly, the scanner will theoretically operate with other SCSI cards or some built-in SCSI implementations, but different drivers will be required -- and Apple will not support other SCSI cards. (Note that this rules out all Microchannel-equipped IBM PS/2s as supported configurations.)

Article Last Updated:

TOPIC ----------

Apple OneScanner for Windows has been confirmed compatible with many IBM PC models and with PC-compatible systems from other manufacturers.

DISCUSSION ----------

Compatible

It would be impossible to test OneScanner for Windows with every brand of Windows-compatible hardware. It should work on most of them. These are the ones we've tested to date:

- ALR PowerFlex 386sx
- ALR486
- AST 486
- Compaq 386/33
- Compaq 486 EISA
- Dell System 325
- Gateway 386/25
- HP Vectra 386/25c
- IBM PS/2 Model 40
- NEC PowerMate 386/25s

Not Compatible

OneScanner for Windows is incompatible with the built-in SCSI implementation found on the IBM PS/2 model 95.

OneScanner for Windows is incompatible with all current Northgate PCs.

Security: Everyone

Apple IIGS: System 6.0 Software and HyperCard IIGS 1.1

==========

Article Created: 27 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes Apple IIGS System 6.0 software and an upgraded version of HyperCard IIGS.

DISCUSSION ----------

Apple IIGS System 6 software offers an enhanced user interface, greater speed and performance, and data exchange capabilities not available on previous Apple IIGS operating systems. HyperCard IIGS version 1.1 has been upgraded to include a Media Control stack for operating CD ROMs and videodisc players, and new HyperTalk scripting capabilities. As with original HyperCard IIGS, version 1.1 is also in color.

Apple IIGS System 6 provides similar ease-of-use and functionality now available with the System 7 Finder for the Macintosh.

Features and Benefits of Apple IIGS System 6

- Three New File System Translators
  These provide easy access to Macintosh disks, Pascal disks, and Apple II DOS 3.3 disks

- Control Panel and Desk Accessory Enhancements
  You can open control panels directly from the desktop. The software incorporates Find File and Calculator desk accessories.

- Finder Help
  You can access Finder Help through pop-up menus and keep it on screen while stepping through procedures.

- Enhanced Window Handling and Window Appearance
  It's easier to move between and manage multiple windows on a single screen.

- Two New Applications: Teach and Archiver
  Teach is a desktop text processor that enables you to jot down notes, read disk files, and create formatted or unformatted text documents. Teach also provides file import capability from ASCII, AppleWorks version 3.0, AppleWorks GS, MacWrite version 5.0 formats, and AppleWriter. Archiver offers flexible hard disk backup functions to save and restore either individual files or entire volumes.

- Media Control Toolset
  This is a new tool/driver/control panel/desk accessory combination that allows you to integrate, configure, and manage highly sophisticated multimedia effects. Use it in conjunction with HyperCard IIGS version 1.1 to optimize the toolset's performance.

- The Universal Access Suite
  This suite (also available on Macintosh System 7 software) opens the Apple IIGS to disabled users via Video Keyboard, Easy Access, and Closeview programs.

- As with the System 5 series, Apple IIGS System 6 users can network their Apple IIGS computers with each other and with Apple IIe, Macintosh, and MS-DOS computers. However, System 6 improves networking functionality via EasyMount, a new feature that allows users to mount a network server with a simple double-click command.

- Apple IIGS System 6 replaces Apple IIGS System 5.0.4 for the stand-alone Apple IIGS, providing a consistent graphical interface and high performance for both the individual and networked user.

Speed and Feature Enhancements for HyperCard IIGS 1.1

- Media Control Stack
  This allows control of external media devices such as laserdisc players and CD-ROM drives from within the stack. A common interface to two external devices provides control, using standard buttons or floating control panels for "Play," "Fast Fwd," and so on.

- Tune Builder Stack
  This allows you to create short original tunes by simply clicking the mouse on the stack's music staff. You can play notes in variable time, and with the voices of a large collection of instruments. You can use these tunes as enhancements to other original stacks by cutting and pasting.

- Features from Macintosh HyperCard Versions 2.0 and 2.1
  - HyperTalk extensions
  - X Windows

- The Apple IIGS SuperDrive Controller Card

Available for the enhanced Apple IIe and Apple IIGS, this allows users to use Apple's SuperDrive, which permits the use of 1.4MB floppy disks. The SuperDrive card also operates all other Apple II 3.5 disk drives.

System Requirements

- Apple IIGS personal computer with at least 1MB of RAM, ROM version 01 or 03 and one 3.5-inch disk drive, although configurations of 2MB of RAM and a hard drive is recommended for optimal performance.

- Networked systems require Apple IIGS computers with at least 768K RAM, ROM version 01 or 03, and appropriate LocalTalk cables.

- HyperCard IIGS version 1.1 requires an Apple IIGS personal computer with 1.5MB RAM, one 800K disk drive and hard disk or connection to a networked environment, and system software 5.0.3 or subsequent version.

End_Table

NOTES:

Unless otherwise noted, Apple LaserWriters use 30-pin, 80 ns memory SIMMs.

* These LaserWriter printers have the RAM soldered on the board. There are no RAM upgrades available.

% These LaserWriter printers can be upgraded to a LaserWriter IIf or IIg. Contact your local authorized Apple dealer for upgrade information.

The LaserWriter IINTX uses 64-pin, 120 ns (or faster) memory SIMMs.

The LaserWriter Pro 600 and 630 use 72-pin, 80ns (or faster) memory SIMMs. If you use a double-sided SIMM, you can only fill one SIMM slot since a double-sided SIMM electronically occupies both SIMM slots.

The LaserWriter Pro 810 uses special non-standard 4MB and 8MB memory modules.

The LaserWriter Select 310 uses 72-pin, 100 ns (or faster) memory SIMMs.

The LaserWriter Select 360 can be upgraded with a 72-pin, 80 ns 16MB (4 Mbit by

32 bit) SIMM with 2K Row refresh (11 bit by 11 bit).

The LaserWriter Select 360 may be upgraded to 16 MB total by removing the 4 MB SIMM and replacing it with a 16 MB SIMM. The remaining 3 MB of memory is disabled by the controller whenever a 16 MB SIMM is installed.

The Personal LaserWriter SC can be upgraded to a Personal LaserWriter NT. Contact your local authorized Apple dealer for upgrade information.

The Personal LaserWriter NT printer's two SIMM slots are treated as one bank; therefore, you cannot combine 1MB and 4MB SIMMs to get a 5MB configuration.

The Personal LaserWriter NTR uses 72-pin, CAS before RAS, 80 ns (or faster) memory SIMMs.

The LaserWriter 16/600 PS uses 72-pin SIMMs.16 MB SIMMs with a 4K Row (10 bit x 12 bit) refresh configuration are not compatible with the LaserWriter 16/600 PS. Memory configurations of 16+0=16MB and 16+4=20MB are not supported by the LaserWriter 16/600 PS printer.

The Color LaserWriter 12/600 PS uses 72-pin SIMMs. You can mix SIMMs of different capacities in the two SIMM slots. When installing memory simms of different sizes, the larger density SIMM can be installed into either memory slot. There should be no difference in installing larger density SIMMs in J10 or J11.

It is important to remember, however, that you must use single-sided memory SIMMs when upgrading the printer’s memory, if you intend to fill both memory slots. Double-sided SIMMs are recognized as two individual memory banks and could, therefore, cause problems when the printer attempts to address the memory SIMM in the other slot.

For the LaserWriter 12/640 PS printer, the SIMMs must have a 2 KB row (11 bit x 11 bit) refresh configuration. 16 MB SIMMs with a 4 KB row (10 bit X 12 bit) refresh configuration are not compatible with the printer.

Ofoto 1.1: Apple OneScanner Software Upgrade Description

Revised: 6/5/92
Security: Everyone

Ofoto 1.1: Apple OneScanner Software Upgrade Description

==========

Article Created: 10 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Ofoto 1.1 software.

DISCUSSION ----------

The new software for the Apple OneScanner includes Ofoto 1.1 and a revised instruction manual. Ofoto 1.1 incorporates support for QuickTime image compression abilities. This allows you to compress and decompress still image files and save them as much smaller files. The QuickTime system software extension is included with the new software. Other enhancements include the addition of an "autosharpen" command, a simplified calibration process, and improved access to the "image-type" control.

Support for QuickTime compression/decompression abilities significantly reduces the file sizes of scanned images as much as 10 times. QuickTime provides various compression choices, including the Joint Picture Expert Group (JPEG) industry standard method of image compression. QuickTime also makes the opening and decompression of compressed files saved in the standard PICT format automatic to all Macintosh applications. The other enhancements refine the user interface of the scanning software and improve the quality of scanned images.

Personal LaserWriter LS: Software Upgrade

==========

Article Created: 10 March 1992

TOPIC ----------

This article describes a software upgrade for the Personal LaserWriter LS.

DISCUSSION ----------

The software upgrade for the Personal LaserWriter LS includes seven new font families and improved installation software. The new fonts are: ITC Avant Garde, ITC Bookman, New Century Schoolbook, Helvetica Narrow, Palatino, ITC Zapf Chancery, and ITC Zapf Dingbats. The new font set is fully compatible with System 7, and with virtually all software applications.

Apple has also improved the installation of fonts, driver, and printer software with a new installer. This new installer enables users to install or remove fonts, and add new printer software by clicking a button.

MacTCP 1.1: Communicating with SGI Indigo UNIX Computer

Revised: 6/5/92
Security: Everyone

MacTCP 1.1: Communicating with SGI Indigo UNIX Computer

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm having problems communicating with an SGI Indigo UNIX computer using a Macintosh with MacTCP 1.1

Here's the scenario:

I'm connected to an Ethernet network with two Indigo boxes. We've isolated this segment; only our three computers are on it.

- Indigo #1 - 192.100.2.2
- Indigo #2 - 192.100.2.4
- Mac IIfx - 192.100.2.43 (MacTCP, version 1.1)

The Indigos "ping" each other successfully.

I boot a computer with system 7.0.1, but I don't respond to an Indigo's attempt to "ping" me.

I use Etherpeek on the same Macintosh IIfx, and I see their "ping" request packets on the network (even the one addressed to me). Etherpeek gets information, and confirms that I have configured the proper MacTCP address.

I open MacTCP SPY, and I suddenly begin to respond to the "pings." I can then use VersaTerm Pro with the Telnet Comm Tool drivers to log on to the Indigo with no problems. By the way, I continue to respond to the "ping," even when I close MacTCP SPY.

Rebooting with System 6.0.7 on the hard drive, I still don't respond to a "ping," even when I use MacTCP SPY to "kick start."

In short, I need to enable the 6.0.7 Macintosh IIfx to communicate, preferably without a MacTCP Spy "kick start." If the solution is to upgrade to System 7, then I need to have this same capability on this platform as well.

DISCUSSION ----------

The actions you describe are exactly the way MacTCP was designed to operate. The driver isn't loaded until the first TCP/IP application is launched. This is true for both 6.0.7 and 7.0, or we should say MacTCP 1.0 and 1.1.

You shouldn't have to kick-start MacTCP unless you want it to respond to ICMP messages before you run a MacTCP application. If this is the functionality you desire, just set MacTCP Spy as a startup application. This will work under both System 6.x and System 7.x.

AppleTalk: DDP Encapsulated in IP (IP Tunneling) (3/95)

Revised: 3/22/95
Security: Everyone

AppleTalk: DDP Encapsulated in IP (IP Tunneling) (3/95)

==========

Article Created: 23 March 1992
Article Reviewed/Updated: 22 March 1995

TOPIC -----

Is there any way to encapsulate an AppleTalk packet (DDP) into an IP packet to send over an IP protocol only network? If this is possible, I expect I will need something at the other end (gateway) to strip the AppleTalk packet from the IP.

DISCUSSION -----

What you describe is known as IP tunneling, where a gateway/router connected to both an AppleTalk network and an IP network wraps a DDP packet inside a UDP packet. It then transmits that packet across the IP network to another gateway/router that is capable of de-encapsulating the packet.

The IP Extension to the Apple Internet Rounter (AIR) does just that. When talking to another AIR running the IP Extension, you can tunnel AppleTalk through an IP network, including the Internet.

AMP Thinnet and FriendlyNet

Revised: 6/5/92
Security: Everyone

AMP Thinnet and FriendlyNet

==========

Article Created: 25 March 1992
Article Last Reviewed: 18 June 1992
Article Last Updated:

TOPIC -----

I have AMP's Thinnet tap system for Thinwire Ethernet. AMP uses a special vampire-style plug in the wall and a cable running to the user's workstation that plugs into the coax port on the interface card.

We had a problem with FriendlyNet. Since we have two ends, we either get too many terminations on the network (two existing plus one automatic from the transceiver), or reflections (if we open one end up by using a barrel connector). Neither case led to a healthy network.

DISCUSSION -----

You need to use a 222814-1 Test Cable Assembly. This device provides two coax cables that plug into either side of the FriendlyNet transceiver. AMP is 802.3 compliant (the run from the faceplate to the user contains both "ends" of the network).

Security: Everyone

AppleTalk Phase 2: OUI in Ethernet to FDDI Bridges

==========

Article Created: 25 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I have a question about the bridging problem with AppleTalk Phase 2 and FDDI. I found some information that says the IEEE 802.1 committee is currently formalizing the use of OUI in Ethernet to FDDI bridges that will define what to do if a bridge encounters SNAP headers with OUI=0. What is the status of this?

DISCUSSION -----

The IEEE 802.1 committee has adopted the proposal which we, in conjunction with DEC, brought before them to resolve the conflict in using OUI 0. The 802.1 committee has moved the 802.1h specification to the "recommended practice" status which is just short of being a fully adopted and ratified standard.

The 802.1h specification defines how an Ethernet to FDDI translational bridge should operate in the presence of packets that use OUI 0. This is basically a simple filter mechanism which is implemented in the bridge that checks the packets OUI:

- If it's 0, it then checks to see if the packet type is AppleTalk.

- If it's an AppleTalk packet, then it doesn't do any translation.

The key here is to make sure that any potential FDDI bridge vendors have implemented the 802.1h specification.

FriendlyNet 10Base-T: Won't Switch Among IEEE 802.3 Draft Modes

Revised: 6/5/92
Security: Everyone

FriendlyNet 10Base-T: Won't Switch Among IEEE 802.3 Draft Modes

==========

Article Created: 25 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I want to connect a Macintosh Quadra 700 to an existing Novell-based EtherNet with 10Base-T. I can't get contact, and I think it's because the existing network is based on IEEE 802.3 draft 5, while Apple's implementation most likely is draft 10. Other cards/transceivers have the ability to switch between the two modes. What does Apple do to connect to a network based on draft 5?

DISCUSSION ----------

There was a significant amount of work done and products sold before the standard was finalized. Many of the hubs produced before the standard was finalized don't support the Link Integrity function, a test signal used to verify the connection between the transceiver and the hub.

Unfortunately, we don't have any way to disable Link Integrity for our FriendlyNet 10Base-T transceiver, nor do any of the third-party FriendlyNet compatible transceivers support the disabling of this signal. The only solution for this type of environment is to purchase a third-party 10Base-T Ethernet card that supports disabling the Link Integrity function.

AAUI: Pinout Equivalents to AUI

Revised: 6/5/92
Security: Everyone

AAUI: Pinout Equivalents to AUI

==========

Article Created: 31 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC --

What are the pinout equivalents of the AAUI (Apple Attachment Unit Interface) to the standard AUI (Attachment Unit Interface)?

What pin connections are needed for a cable to connect an Apple AAUI to DB15 connector (vampire clip) coming off of a thicknet cable?

What is the maximum length for this cable?

DISCUSSION --

Here are the pinouts for the AUI interface per 802.3 and the matching AAUI pin number:

1 - Shield (Control In shield)
    Not mandatory and not implemented on AAUI

2 - Collision Presence (+) (Control In circuit A)
    AAUI pin 5

3 - Transmit (+) (Data Out circuit A)
    AAUI pin 9

4 - Reserved (Data In shield)
    AAUI Shell

5 - Receive (+) (Data In circuit A)
    AAUI pin 2

6 - Power Return (Voltage Common)

```
        AAUI pin 4

    7 - Reserved (Control Out circuit A)
        Not mandatory and not implemented on AAUI

    8 - Reserved (Control Out shield)
        AAUI Shell

    9 - Collision Presence (-) (Control In circuit B)
        AAUI pin 6

   10 - Transmit (-) (Data Out circuit B)
        AAUI pin 10

   11 - Reserved (Data Out shield)
        AAUI Shell

   12 - Receive (-) (Data In circuit B)
        AAUI pin 3

   13 - Power (Voltage Plus)
        AAUI pin 1

   14 - Reserved (Voltage shield)
        AAUI Shell

   15 - Reserved (Control Out circuit B)
        Not mandatory and not implemented on AAUI
```

You can use the same specifications as apply to the AUI cable to compute the maximum length of the AAUI cable when used to interface to a 10BASE-5 network. Hence the AAUI cable could be up to 50 meters long. When attaching to other 802.3 compliant networks, the length of the AAUI cable has different characteristics. When used to attach to a 10BASE-2 network the AAUI cable length should be limited to 1.33 meters.

The biggest problem you're going to face in putting this type of cable together is that all Macintosh computers don't have +12 volts available to drive the AUI transceiver. The transceiver needs an external power supply.

10BASE-2 AAUI Notes

FriendlyNet can support a maximum of 40 nodes per network segment. This is more than the maximum of 30 nodes described in the 10BASE2 specification. This is achieved through use of more stringent design specifications for both the MAU and the Apple Coaxial cables, and by using a fixed, short cable connecting host to drop box. (This doesn't preclude the use of standard RG-58 C/U cables, but reduces the recommended node count to 30.)

General AAUI Interface Notes

Except for the pins that supply power, each AAUI signal has the same description, function, and electrical requirements as the AUI signal of the

same name. This is detailed in IEEE Standard 802.3-1988 CSMA/CD, paragraph 7.6.3, P. 105.

To allow connection of Apple AAUI-equipped hosts to standard 802.3 MAUs, possibly accessing different media, an AAUI to AUI converter shall be provided. Because all Apple equipment isn't capable of supplying the +12 VDC @ 500 mA necessary to power a standard AUI as specified in the IEEE 802.3 standard, the converter requires external power.

Personal LaserWriter NTR: No Automatic Emulation Switching

Revised: 6/5/92
Security: Everyone

Personal LaserWriter NTR: No Automatic Emulation Switching

==========

Article Created: 30 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Does the Personal LaserWriter NTR have automatic emulation switching?

DISCUSSION ----------

The Personal LaserWriter NTR does not have automatic emulation switching.

Some people might confuse the port arbitration function with emulation switching. Personal LaserWriter NTR, like the LaserWriter IIf and LaserWriter IIg, can accept jobs from all three ports at the same time, and process each job in turn. It can't sense a specific job's data stream, and switch from PostScript to Hewlett Packard PLC 4 emulation, or from HP PLC 4 to PostScript. To move from PostScript to HP PLC 4 emulation on a specific port, you must download a PostScript program or change the printer's switch setting (you can also use the utility).

You can connect to a Personal LaserWriter NTR to configure one port for PostScript and another for HP PLC 4. That means the printer, via automatic port arbitration, alternately processes PLC and PostScript jobs, though not through one individual port.

PostScript Level 2: Change in PostScript Version and Pagetype

Revised: 6/5/92
Security: Everyone

PostScript Level 2: Change in PostScript Version and Pagetype

==========

Article Created: 9 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

When we access the value of the variable "version" from the printer we get a value of "2010.113" as the current version number. This variable has previously given us values of "38.0" and "47.0" on LaserWriter II and LaserWriter Plus models. Is the version really 2010.113, or is there something different that has altered the name or location of this information?

When accessing the PostScript variable "pagetype" we previously got values of "0" returned, but with the LaserWriter IIg we get an "undefined" variable. Are there many other variables that have changed, specific to the Apple version of PostScript?

DISCUSSION ----------

Yes, the version of PostScript used in the LaserWriter IIf and IIg is 2010.113. This is Adobe's current numbering convention, and will continue for new PostScript Level 2 implementations. We've seen a number of programs that assume the returned value won't exceed 4 characters. While the new version numbers can cause a problem here, the real culprit is the programmer who made an assumption about the size of data returned. The value returned by version has never been documented to return a specific length of data.

The pagetype operator is no longer defined in PostScript Level 2. It was a statusdict operator in many, but not all, Level 1 implementations, and as such wasn't guaranteed to exist on different printers. Actually, this was true of any statusdict entry.

Level 2 uses a more comprehensive method for defining information about the output device, and PageSize is included as one of its parameters. The operator you'll need information on is setpagedevice, which is described fully in the PostScript Language Reference Manual, 2nd Edition. Note that the various setpagedevice parameters may be different on different printers, so a program should check for the existence of specific entries before attempting to use them. Once your code confirms it's running on a Level 2 implementation, it can obtain a list of the individual parameters for that specific printer:

```
currentpagedevice { pop == } forall flush
```

This will return the list over the communication channel. If you wish to query the current setting of a specific parameter, use code with this syntax:

```
currentpagedevice /PageSize get == flush
```

Setting PageSize, an array of two numbers, requires the setpagedevice operator to modify the parameter dictionary. The syntax can look like:

```
<< /PageSize [ 612 792 ] >> setpagedevice
```

Also, six operators are available to set up the most common page sizes. These operators are letter, lettersmall, legal, a4, a4small and b5. Their dimensions are listed on the configuration page printed by the LaserWriter Utility.

There are many other changes from PostScript Level 1 to Level 2. We strongly recommend the PostScript Language Reference Manual, 2nd Edition, by Adobe Systems and published by Addison Wesley.

Article Created: 10 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

What is the speed of the LaserWriter IIg SCSI interface?

DISCUSSION -----

The SCSI interface of the LaserWriter IIf and LaserWriter IIg is capable of SCSI transfer rates of up to 3MB per second. The actual SCSI transfer rate depends on such factors as the hard disk attached and the operation being performed.

LaserWriter IIf and IIg: Frequencies and Screen Angles

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What is the line screen number (lines per inch) for the LaserWriter IIf and LaserWriter IIg? It was 53 on an LaserWriter IINTX.

DISCUSSION ----------

With PhotoGrade off, the LaserWriter IIf and LaserWriter IIg are just like the LaserWriter IINTX:

- Frequency: 53 lpi
- Screen Angle: 45 degrees

With PhotoGrade on, there are five settings available via the LaserWriter Utility. Here are the numbers:

Far right:	Frequency: 150 lpi;	Screen Angle: 0 degrees
Middle right:	Frequency: 106 lpi;	Screen Angle: 45 degrees
Center:	Frequency: 83 lpi;	Screen Angle: 56 degrees
Middle left:	Frequency: 75 lpi;	Screen Angle: 0 degrees
Far Left:	Frequency: 53 lpi;	Screen Angle: 45 degrees

Note: The "Middle right" setting is the default PhotoGrade setting.

LaserWriter IIf, IIg: Arbitrate Print Jobs Rather Than Buffering

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Do the LaserWriter IIf and LaserWriter IIg buffer jobs waiting for the next ports as part of the "all ports active" feature?

DISCUSSION -----

No. Each job is arbitrated and takes over the printer while it's printing. Jobs on other ports have to wait for the jobs ahead to finish.

LaserWriter IIf and IIg: Adding RAM to Improve Performance

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

For high-end printing, we needed 12MB on a LaserWriter IINTX. What's the equivalent RAM needed on the LaserWriter IIf or IIg to get the same performance as a 12MB LaserWriter IINTX?

DISCUSSION ----------

We haven't done any testing to compare the LaserWriter IIf or LaserWriter IIg to the LaserWriter IINTX in this way. We suggest trying the stock LaserWriter IIg with the same documents and adding memory as necessary. Adding more memory will help performance. The maximum RAM that the LaserWriter IIf and LaserWriter IIg can have is 32MB.

LaserWriter IIf and IIg: Toner Cartridges

Revised: 4/20/93
Security: Everyone

LaserWriter IIf and IIg: Toner Cartridges

==========

Article Created: 23 March 1992

Article Change History

04/16/93 - CORRECTED
- To discuss refilled, rather than remanufactured toner cartridges

TOPIC ----------

The new toner cartridges have the same part number as the old ones. Is there any way to distinguish the new ones from the old ones?

DISCUSSION ----------

No. Apple started shipping the new toner cartridges about two months before the introduction of the LaserWriter IIf and LaserWriter IIg. There should be very few of the old cartridges in use now.

Note: Apple doesn't recommend the use of refilled toner cartridges with the LaserWriter IIf and LaserWriter IIg. This is especially true when using PhotoGrade.

Security: Everyone

LaserWriter IIf and IIg: Printing Font Sample with Many Fonts

==========

Article Created: 27 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have a LaserWriter IIg with a 40MB hard drive attached.

I've reformatted the hard drive several times and downloaded fonts with the LaserWriter Utility (as shipped with the LaserWriter IIg). When I try to print a Font Sample, the LaserWriter processes it for a while and then comes back with an error "Unable to Print Because of A PostScript Error."

I've tried it several times with different Fonts and found that when there are more than 40 or so fonts it will get the error, but when there are 30 fonts or less, it will print.

DISCUSSION ----------

This is a known limitation of the code that prints the font samples. Printing a font sample of many different fonts can exceed the memory of a LaserWriter (depending on the amount of memory installed). The code could work around this by breaking the samples across pages as memory grew short, but it doesn't.

Below is PostScript code that prints a sample of all available fonts, one per page. (This can take a long time with many fonts.) It was written by a Sun Microsystems employee, but can be freely distributed. We've inserted some code to prevent page clipping on a LaserWriter IIg.

Copy the text between the "cut" lines and paste it into a blank text document. Once saved, you can download it to a LaserWriter with the LaserWriter Utility included with the LaserWriter IIf and IIg.

A/UX: Hiding CommandShell

Revised: 6/11/92
Security: Everyone

A/UX: Hiding CommandShell

==========

Article Created: 9 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

We need to transparently prevent the CommandShell from launching when certain users (anyone except root) log in to the system.

To do this, we tried setting CommandShell privilege to "700" with the chmod command, so only root has execute privileges. This seems to work fine for logging in, but when logging out, a white screen displays a text message that says the mac32 process is unable to execute CommandShell, and press the return key to exit to the login prompt.

We need to find a cleaner way to do this. Is the mac32 binary actually looking to close CommandShell, or is there some buried configuration shell script or file that we can alter to make this operation smoother for our future non-technical A/UX users?

DISCUSSION ----------

The screen became white when the user logged out because the "screenrestore" wasn't executed in the "/mac/bin/mac32" script file, due to the missing logfiles that the CommandShell program should have created.

Changing the "CommandShell" privilege to "700" isn't a good idea. Here's a better way:

1) Login as the "root" superuser.

2) Make a copy of /mac/bin/mac32 a temporary file, for example:

```
cp /mac/bin/mac32 /tmp/.mac32
```

3) Edit the /tmp/.mac32 file, then comment or remove the line that executes the CommandShell. The line should look like this or be removed from the .mac32 file:

```
# /mac/bin/CommandShell -u > $CSLOGFILE 2>&1 &
```

4) Change the permission of the /tmp/.mac32 file into read-execute only:

```
chmod 500 /tmp/.mac32
```

5) Copy /tmp/.mac32 onto the home directory of the user who doesn't want to execute CommandShell. For example, jim:

```
cp /tmp/.mac32 /users/jim
chown jim /users/jim/.mac32
chmod 500 /users/jim/.mac32
```

The .mac32 file in the user's home directory can override the global /mac/bin/mac32 shell script.

Note that if you remove the .mac32 from the user's home directory, the global /mac/bin/mac32 script executes.

MacX: Can Run Under Macintosh Operating System

==========

Article Created: 9 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Can I run MacX without running A/UX?

DISCUSSION -----

Yes, you can run MacX under Macintosh OS. Basically all Macintosh computers from the Macintosh Plus up to the Quadra 900, and PowerBooks with at least 2MB of RAM and with system software version 6.0.5 or later, support MacX. For color display, at least 4MB is recommended. The Macintosh 512K may run MacX too if you can upgrade with third-party RAM to at least 2MB.

MacX and Apple X Window System

Revised: 6/11/92
Security: Everyone

MacX and Apple X Window System

==========

Article Created: 9 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

What is the difference between MacX and Mac X window? Are they the same product?

DISCUSSION -----

MacX is an X Window System display server, developed by Apple for the Macintosh family of computers. The current version of MacX 1.1.7 is X11R4 based.

We assume you're referring to Apple X Window System products that include MacX display server for Macintosh OS and A/UX, and X11 for A/UX (implementations of X Window System, Version 11, Release 4). The X Window System, nicknamed X, was designed by a team of researchers from industry and from the Massachusetts Institute of Technology (MIT).

MacX: Via ARA and DDP-IP Gateway

==========

Article Created: 24 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I am attempting to create a dial-in X window session using ARA (AppleTalk Remote Access), MacX 1.1.7, Mac TCP 1.1, and a FastPath 4 with K-Star 9.1. The solution works over LocalTalk. But when I disconnect from the network, dial up the ARA server, and attempt to execute an X command, I get a "Could not open display" error in MacX.

The session log either gives me a "Could not open display" error, or acts as if the X session is open, even though I get no window on the display server screen. MacX makes the connection to the X client, and the FastPath properly assigns a TCP/IP address to the server (from the range I set up in K-STAR). I simply get no screen display on the server. Knowing that X is shipping screen bitmaps across the link, I'm assuming that ARA is the problem.

Are there any documented incompatibilities between MacX and ARA?

DISCUSSION -----

We set up a similar configuration to run MacX via ARA and a KIP fastpath gateway. We encountered no problem starting an X client from MacX remote command and/or from a remote X host (an A/UX with X11R4 clients, for example).

If you've configured and set up this kind of environment correctly, we suggest doing the following, after ARA is connected and before doing MacX:

1) Make sure you choose ARA from the Network control panel and reboot the system.

2) Make sure you choose the right zone (on which your Fastpath resides) from the MacTCP control panel.

3) In the MacTCP control panel, make sure the netmask is the same as the one the Fastpath server uses. Basically, verify all information in the MacTCP control panel.

4) Use the "MacTCP Spy" program, a MacTCP utility to show the current status of MacTCP on the Macintosh. The IP, Subnet Mask, and Gateway addresses will be shown if it talks to the Fastpath gateway.

5) From the remote X client host (most are UNIX boxes), try to "ping" (doing the ICMP request), to see if it can reach your Macintosh. If this doesn't work, it's most likely the netmask, or broadcast address, or routing table problem.

6) Now try MacX.

7) Make sure the -display option on the MacX remote command line matches the one in the "Display" pop-up menu (0-3).

MacX: Client Crash Due to Default Color Map

Revised: 6/11/92
Security: Everyone

MacX: Client Crash Due to Default Color Map

==========

Article Created: 31 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm using MacX and the Khoros image manipulation package from the University of New Mexico. Using the Khoros editimage program, the client windows appear on the screen just fine, but when I attempt to open an image, the client crashes with the following message:

```
X Error of failed request:  BadValue (integer parameter out of range for operation)
Major opcode of failed request:  89 (X_StoreColors)
Value in failed request:  0x100
Serial number of failed request:  3859
Current serial number in output stream:  3861
Major X error encountered for display '128.36.2.15:0.2'! Unable to recover.

[1]    Exit 1               editimage
```

AND the MacX application crashes with either a bus error, a bad F-trap error, or an ID 12 error.

This behavior is 100% repeatable with those images that cause it. However, certain images will display reliably, with a 0% chance of causing the crash. The program seems to fail when the image contains more than about 200 different colors. (All the images are 8 bits deep, but some have smaller palettes, not using all 256 values.)

The Khoros putimage program, which is simpler (it only displays the image without allowing any manipulation), can reliably display all the images on the Macintosh screen . The editimage program has no problem displaying images on the Sun screen.

I'm using various Macintosh II-class computers (IIci, IIfx), which are all connected to LocalTalk. I'm running MacX 1.0.1, MacTCP 1.1, MacTCP Tool 1.0 and System 6.0.5. I tried the same thing on a Quadra 900 running System 7.0.1, MacX 1.1.7, MacTCP 1.1 and the MacTCP Tool 1.1 and experienced exactly the same behavior. So I don't believe a software upgrade will solve his problem. I make IP connections through a FastPath, and the host is a Sun Sparcstation 1.

DISCUSSION ----------

The problem described probably involves the MacX loading the "standard color maps" by default, since many X client applications use the STANDARD or default X color map. MacX uses the standard Macintosh system palette as the DEFAULT color map (it should). This allocates/locks about 128 colors, and leaves about 130 color map cells free for clients to write in that map. Therefore, if the application tries to allocate more than 130 colors in that color table, it fails. In other words, you CAN'T allocate more than 130 colors in the DEFAULT color map; you have to create a NEW color map and install your colors into it.

Applications that use the standard or default color map will cause this situation. Recently, MacX provided a patch for applications that don't create their own color maps and need a full 256 colors to work properly. The patch (using ResEdit) bypasses the standard color map initialization when MacX launches. Here are the patch instructions:

1) Back up golden master of MacX 1.1.7.
2) Open MacX 1.1.7 with ResEdit.
3) Double-click on the CODE resource icon.
4) Select ID #4.
5) At the offset 0x2952:
   - Change the 0x4E56 to 0x4E75,
   - Save the change and exit ResEdit.

This removes the standard color map initialization.

Audio Interchange File Format: Sound Files To Windows (7/94)

==========

Article Created: 27 March 1992
Article Reviewed/Updated: 12 July 1994

TOPIC ----------

I'm looking for information on the Audio Interchange File Format (AIFF). Is it a standard on Macintosh? Is it supported under Windows? How can I move sound files to DOS/Windows?

DISCUSSION ----------

The AIFF sound files are the standard file format defined by Apple and several third-party developers for sampled (digitized) sound.

However, Windows support is a different issue. Windows uses its own file format for digitized sound. A simple AFE transfer won't provide a usable sound file in the Windows/MS-DOS environment. If Windows did support the AIFF file format, then an AFE transfer would be appropriate.

The AIFF sound file has header information which can be followed by a variety of "chunks." One of these chunks represents a linear sampling of audio waveforms stored as bytes. A general overview of AIFF files is in Chapter 22, The Sound Manager, of Inside Macintosh VI. A more complete description of the AIFF file format is available from APDA.

Nothing in the Windows/MS-DOS world can directly understand the header information. Therefore, you need to do a file conversion. The only utility commercially available that we know of (as of July, 1994) is "SoundEdit 16" from MacroMedia. SoundEdit 16 can read Macintosh formatted (AIFF) files and then create Windows Wave files as output. To locate a vendor's address and phone number, use the vendor name as a search string.

Article Change History:

System 7: User Limits for Publish and Subscribe

Revised: 4/6/92
Security: Everyone

System 7: User Limits for Publish and Subscribe

==========

Article Created: 27 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What's the maximum number of users when sharing files under Publish and Subscribe?

DISCUSSION ----------

There's a theoretical limit to the number of subscribers to a file. If you were to reach this limit, you would far exceed the capability of whatever server you're connecting to. The theoretical limit is based upon a counter the Edition Manager uses to keep track of the number of subscribers to an edition file.

Each subscriber's computer opens the file. So if that computer has reached its limit on the number of files it can have open, you won't be able to subscribe to an additional file until you close a file. On the server front, the edition file is only opened once. So the number of subscribers won't affect the number of files that the server can have open.

Real world environments are far lower than that limit. For example, the maximum number of users who can log on to an AppleShare 3.0 server is 120, if you've configured your server for this number.

PowerBook: Hard Drive Contains Head-Parking Safety Feature 8/92

==========

Article Created: 18 March 1992
Article Reviewed/Updated: 19 August 1992

TOPIC ----------

Please explain the head-parking feature of the Macintosh PowerBook hard drive.

DISCUSSION ----------

The 2.5-inch hard drives used in the PowerBook computers contain a landing zone with an actuator latch feature. The actuator arm is released from its locked position only if the read/write heads have achieved a stable flying condition. This feature ensures that there is no direct physical contact between the heads and the data area on the disk surfaces. If, for any reason, power is suddenly removed from the drive, the actuator arm automatically retracts to the landing zone before the heads have made contact with the disk surfaces and locks in place until power is restored.

Note

Although the hard drives have this head-parking safety feature, Apple states that the PowerBook should be shut down before transporting. For further information, search on "PowerBook and transporting".

PowerBook Computers: Tips for Transporting (4/95)

==========

Article Created: 18 March 1992
Article Reviewed/Updated: 03 April 1995

TOPIC ----------

I've heard that I shouldn't move my Macintosh PowerBook when it's in the Sleep mode because the heads are not properly parked. Does this mean that I need to shut down my PowerBook before I move it?

DISCUSSION ----------

Although the 2.5-inch hard drives used in the Macintosh PowerBook contain a landing zone with an actuator latch feature, Apple's official position is that a PowerBook should be shut down before being transported.

In general, it's okay to transport PowerBook computers while they are asleep, and here's why (note that this same information applies to essentially all modern hard disks).

• The hard disk is the primary component that's vulnerable to damage when transporting a PowerBook The main concern is vibration (jarring, jiggling, knocking, dropping).

• When the PowerBook hard disk is not spinning, it is locked and is as safe to move as it's ever going to be. In this respect sleep and shutdown modes are identical.

• The only thing to be very careful of when moving a PowerBook (or any other hard disk) is that it not be jarred while the hard disk is spinning up or spinning down. During this period the hard disk is much more vulnerable to damage from vibration.

• After the hard disk is fully up to speed, it is still susceptible to shock or vibration damage.

• When moving a sleeping PowerBook (or a PowerBook 100 even when shut down,

unless you've flipped off the indented battery disconnect switch), there is a slight danger of accidentally hitting a key that would wake up the PowerBook and also power-up the hard disk. Make sure that your PowerBook is solidly closed so it can't accidentally start up.

• If you are running totally off a RAM disk and your system is asleep, wake-up would not spin up the hard disk anyway. So, transporting a sleeping PowerBook that is running totally off a RAM disk is relatively safe.

• Using a PowerBook in a moving vehicle is a risk that the Apple PowerBook manual neglected to mention. Due to the nature of use while travelling, the repeated spin ups and downs of the drive can put it at more risk than in desktop operation. Additional caution should be exercised when using the PowerBook while moving.

Unfortunately, you can't guard against all events. It should really take a determined knock at just the right time to do real damage. If you are reasonably careful (and keep in mind when the PowerBook is most vulnerable), you should be able to travel with your PowerBook (asleep or not) just fine.

Running a PowerBook entirely from a RAM disk is much safer in this case.

For more information on the actuator latch feature, use "PowerBook and Head-Parking" as a search string.

AppleTalk Remote Access: AppleTalk Must Be Active (6/93)

==========

Article Created: 18 March 1992

Article Change History

06/07/93 - Added information about Always AppleTalk.

TOPIC ----------

I installed AppleTalk Remote Access on my Macintosh PowerBook 170 and my Macintosh IIci (both are running System 7). When I try to go into Remote Access Setup, I get a message saying that AppleTalk Remote Access wasn't installed or that the extensions were turned off at startup.

I tried re-installing AppleTalk Remote Access from known-good disks on both systems, and I still get the same message.

DISCUSSION ----------

This message appears when AppleTalk is not active.

To make AppleTalk active:

1) From the Apple menu, select Chooser.

2) In the Chooser window, click the AppleTalk Active button.

3) Restart your Macintosh.

You should now have access to AppleTalk Remote Access.

You can also use the Always AppleTalk software which is part of the PowerBook File Assistant collection of software. This allows a System 7.1 user to switch between AppleTalk being active and in active without restarting the computer.

StyleWriter: Ink Cartridge Shelf Life

Revised: 6/11/92
Security: Everyone

StyleWriter: Ink Cartridge Shelf Life

==========

Article Created: 24 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What is the shelf life of a StyleWriter Ink Cartridge?

DISCUSSION ----------

The shelf life of a packaged StyleWriter Ink Cartridge is 18 months. However, if the package has been opened, the StyleWriter Ink Cartridge lasts for approximately 6 months.

Note

This 6-month estimate is applicable only if the StyleWriter Ink Cartridge is installed in the printer. Canon, the cartridge vendor, recommends that you don't unpackage the cartridge until you are ready to install it in the StyleWriter and, therefore, doesn't not provide shelf-life information for cartridges that are unpackaged but not installed in the printer.

AppleShare 3.0: Splitting File and Printing Services

==========

Article Created: 31 March 1992
Article Last Reviewed: 6 April 1992
Article Last Updated: 6 April 1992

TOPIC ----------

I am about to install AppleShare 3.0 on a new network consisting of four Macintosh Quadra systems. I understand that I can have both file and printing services on one server. However, can these two functions be split and placed on two separate systems, and would there be any performance improvement if I did this?

As my network grows and I add more nodes, possibly up to 10, will a Macintosh Quadra server with both services handle these functions as well as a setup with the file server on a Macintosh Quadra and the print server on another Macintosh?

DISCUSSION ----------

The AppleShare 3.0 File Server and Print Server are separate applications and can be used independently.

Splitting these two functions may improve processing time; however, in your proposed environment of 10 nodes, the gain would be minimal.

StyleWriter: Manual-Feed Printing

==========

Article Created: 26 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm having a problem printing manual-feed jobs on my StyleWriter printer, even though I'm using the standard manual-feed process:

1) Choose Print from the File menu.

2) Select the manual-feed option.

3) Click the "Print" button.

4) Wait for the dialog box saying to "Insert next sheet of paper."

When I insert the paper, I get an error, and the job doesn't print.

DISCUSSION ----------

When using the manual-feed option with the StyleWriter, you need to deselect the printer before you insert the paper and then reselect it to print.

Follow these steps for printing manual-feed jobs on the StyleWriter:

1) Choose Print from the File menu.

2) Select the manual-feed option.

3) Click the "Print" button.

4) Wait for the dialog box saying to "Insert next sheet of paper."

5) Press the StyleWriter "Select" button to deselect the printer.

6) Insert the sheet (or envelope). The StyleWriter advances the paper about 1/2 inch.

7) Press the StyleWriter "Select" button again to reselect the printer.

8) Click "OK" in the dialog box to start the print job.

AppleTalk: Filtering AppleTalk Traffic From Remote Links

Revised: 4/7/92
Security: Everyone

AppleTalk: Filtering AppleTalk Traffic From Remote Links

==========

Article Created: 31 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

This article explains how to identify and filter AppleTalk packets from remote links.

DISCUSSION -----

Many organizations, particularly those whose data processing centers are run on DEC VAX computers, use Ethernet as their primary data communications link. When these organizations need to connect remote sites to their networks, it is quite common to extend a local Ethernet to the remote site using a transparent learning bridge and a leased digital telecommunications line, such as a 56K bps or a T1 line.

If AppleTalk nodes are connected anywhere on this extended Ethernet, any broadcast traffic they generate is forwarded across the remote link and may cause unwanted traffic on this line. And, if AppleTalk routers are present on both sides of the link, they exchange routing tables. As long as no configuration conflicts are present, they reliably route AppleTalk traffic between the two sites, which can be useful if you want to interconnect distant AppleTalk networks. However, if are not prepared to administer an AppleTalk WAN, or you don't want to have the two sites connected, this situation can cause problems.

For these reasons, you may want to filter AppleTalk traffic from the remote link, either to save transmission bandwidth on the link and/or to separate two AppleTalk networks that should not be connected. This is usually done by configuring the bridges to discard AppleTalk packets rather than forwarding them.

Here's how to do filter AppleTalk packets for both AppleTalk Phase 1 and

Phase 2 networks:

To filter AppleTalk traffic from a remote link, the bridges on both ends need to be set up to filter two kinds of packets. It is important that both ends of the link are set up for filtering, since most remote bridges filter only outgoing traffic. If AppleTalk traffic is passing in one direction and not in the other, there will be problems with routers on the end that receives the other's traffic.

Filtering AppleTalk Phase 1 is fairly straightforward. Since AppleTalk Phase 1 uses standard Ethernet headers, you can set the bridge to filter based on Ethernet protocol type (a 2-byte field in the packet that begins at byte 13). The two types to filter are $80F3 (for AARP) and $809B (for all other AppleTalk). Most bridges have a specific protocol filtering capability, so you simply need to specify which packet types to pass and which to discard, and the bridge does the rest.

Because AppleTalk Phase 2 does not use the old-style Ethernet header, you can't filter AppleTalk Phase 2 based on Ethernet protocol type. AppleTalk Phase 2 uses IEEE 802.2 and SNAP (Sub-Network Access Protocol) to provide interoperability with Token Ring networks because Token Ring uses 802.2 as its only means of specifying which protocol is in use. The 802.2 header begins at byte 15 of the Ethernet frame, and for AppleTalk, it looks like this:

```
                |       |
    Byte 15:    |  $AA  | \
                |  $AA  |  |- 802.2 header (3 bytes)
                |  $03  | /
                |  $08  | \
                |  $00  |  \
                |  $07  |   |- SNAP Protocol Discriminator (5 bytes)
                |  $80  |  /
                |  $9B  | /
                |       |
```

Thus, the bridge must be set to discard all packets that have this 8-byte pattern beginning at byte 15. This is usually accomplished as a different filtering function, by specifying the pattern to match and where to look for it. The bridge does not care what the data mean: if it finds the specified pattern at the right place, it discards the packet.

AARP (AppleTalk Address Resolution Protocol), which has a different protocol discriminator from other AppleTalk traffic, must also be filtered. The pattern to filter for AARP looks like this:

```
                |       |
    Byte 15:    |  $AA  | \
                |  $AA  |  |- 802.2 header (3 bytes)
                |  $03  | /
                |  $00  | \
                |  $00  |  \
                |  $00  |   |- SNAP Protocol Discriminator (5 bytes)
```

```
                  |  $80  |  /
                  |  $F3  | /
                  |       |
```

AppleTalk Remote Access: Chooser and Get Zone List

Revised: 4/13/92
Security: Everyone

AppleTalk Remote Access: Chooser and Get Zone List

==========

Article Created: 2 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I have a question about AppleTalk Remote Access and Zone List Time-Out Values. When requesting the Get Zone List in the Chooser, I get the message, "Chooser: Zone List Time-Out Values." How do we get around this problem with our own AppleTalk Remote software?

DISCUSSION -----

The mechanism used in AppleTalk Remote Access (ARA) is actually quite simple. This is the way the Chooser works for remote ARA stations:

1) The remote ARA Macintosh logs in to the server.

2) The remote ARA-connected Macintosh receives the current zone list. The remote Macintosh then caches that list, and services all requests from that cached list. The GetZoneList call is patched on the remote station, and instead of requesting data from a remote router, it comes from our cache.

The only problem with this scheme is that the users are presented with a static view of the network, or at least the zones on the network. If a new zone appears, or if an existing zone disappears they won't see those changes reflected in their Chooser until they log-off and then back in.

Macintosh Chooser: GetZoneList Command Times Out

==========

Article Created: 2 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

We have a problem with the Chooser command GetZoneList timing out when dialing in to a WAN over 2400 baud modems. We want this command to allow enough time to find all of the zones.

Our network has 56 zones. Users dial in from all types of Macintosh and Outbound computers, and from all over the country. They dial in to Shiva devices including Telebridges, NetModems, and NetSerials. Most (90%) connections are at 2400 baud. (We chose not to use AppleTalk Remote Access, since it requires a dedicated Macintosh and System 7.) After establishing a connection, we open the Chooser and get one of two results:

- No zones appear (the GetZoneList times out before returning ANY packets), or
- 38 to 40 zones appear (the GetZoneList times out after the first packet).

AppleTalk Remote Access software traps the GetZoneList and freezes the zones. How can we make it work with our network?

DISCUSSION -----

The Chooser isn't well-suited to all WAN topologies. But it's actually tuned and works well for local area network environments and high bandwidth WAN links.

The Chooser isn't broken. The Shiva dial-in products push the current Chooser past its intended use, without offering an alternative. To fix this, Shiva could:

- Implement a Shiva-specific Chooser for use with their dial-in AppleTalk

products, or

- Patch the GetZoneList call in the remote Macintosh computers to function more like AppleTalk Remote Access.

AppleTalk Remote Access is a good example of how to develop a remote AppleTalk product within the present GetZoneList parameters.

AppleTalk and TCP/IP Half-Router

==========

Article Created: 3 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I'm in search of AppleTalk and TCP/IP half-routers for use with synchronous or asynchronous modems and 10BaseT or ThinNet. Many of the solutions I've come up with (IBM, Netware, Proteon) are PC-based. I'd like either a stand-alone or Macintosh solution. Each router would need only two ports: a sync/async port, and an Ethernet port. The maximum speed needed for the sync/async port would be 19.2 kbps.

DISCUSSION -----

Unfortunately, there are no low-end AppleTalk and TCP/IP routers which support serial-based connections. The only two routers that even come close to filling the requirements are the SyncRouter by Engage Communications, and the CommTalk by APT. Neither of these supports native TCP/IP routing. The only solution to the low-end multi-protocol router is the cisco IGS.

The SyncRouter supports speeds up to 500KB on its serial interface and provides a single LocalTalk port for connection to the local network.

Engage also has a new Ethernet based router that supports T1 speeds and allows up to four serial connections.

The CommTalk router is available in several configurations, both as a local and remote router. It's configurable for up to six local network attachments, either Ethernet or LocalTalk, and one high-speed serial port for wide-area communications. The CommTalk supports speeds up to 1.544MB (T1) on the high-speed serial port.

On AppleLink, you can find contact information for the various vendors by

LAN Cabling: Segment Size and Distance Between Devices

==========

Article Created: 3 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm confused by figure 16 on page 20 in the "Local Area Network Cabling Guide." What's the difference between "minimum distance between devices" and "maximum segment length"? What does "segment" mean in this context?

DISCUSSION ----------

The minimum distance between devices specifies the minimum distance between adjacent nodes on a wire. Maximum segment length specifies the maximum length of the wire. A segment is a single network entity or wire without repeaters used to extend the over-all length of the network. You can use repeaters to extend the network to its maximum length specified by the "Maximum network length" information given in Figure 16.

Maximum Segment Size:

```
  185 meters                 185 meters
[------------]--[repeater]--[------------]
   Segment A                  Segment B
```

Minimum Distance Between Devices:

```
   |.5 meters|
[-------------------------------------------------]
   |         |
  [Mac]    [Mac]
```

PowerBook Fax Modem: Improving Speed 4/92

==========

Article Created: 3 April 1992

TOPIC ----------

Configuration:

- Apple PowerBook Fax/Modem Software
- PowerBook 100, 4MB RAM
- System 7.0.1

The software is slow to image a page and get it ready to fax. It can take up to 2.5 minutes to image a single page. It appears to me that this may have something to do with the presence of ATM in my system, but I haven't really pinned it down exactly.

However, a PSI PowerModem (or, rather, the software that accompanies it), on the identical PowerBook 100 configuration (hardware and software), gets the same page ready to transmit in about 15 seconds, a tenfold speed improvement.

Even though it works in the background, there are times when I want the fax sent right away. I've had to wait five minutes to send a short fax.

DISCUSSION ----------

To help speed things up, change the Fax Page Setup Image Quality from "Fine" to "Standard."

LaserWriter IIf/IIg: Formatting Third-Party Hard Drives

==========

Article Created: 8 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

We recently upgraded our LaserWriter IINTX to a LaserWriter IIg. We had a Microtech Europa 40MB drive connected to the LaserWriter IINTX, which we want to continue using with this LaserWriter.

As the manual stated, we removed the drive's internal termination and are using the black terminator. We can see the drive with the LaserWriter Utility program, but after starting the initialization process, the utility reports that the initialization failed.

Is there a compatibility problem with the Microtech Europa drive and the LaserWriter IIg?

DISCUSSION ----------

Compatibility problems have been reported with some third-party hard drives. Apple's engineers have checked into the problem and found that most can be resolved by formatting the hard drive with a different utility.

Here are some alternatives you can try:

- Since the LaserWriter IIg uses an HFS format, try formatting the hard drive on the Macintosh and moving the hard drive to the LaserWriter IIg.

- Try formatting the hard drive with a third-party utility like LaCie's SilverLining.

- Contact the hard drive vendor to learn if there are known compatibility problems with the printer, and if there are any fixes.

MacWrite II: Using on a Macintosh With More Than 16MB RAM

==========

Article Created: 9 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Whenever I try to run the MacWrite 1.1.v2 spell checker on my Macintosh Quadra (with 20MB RAM and 32-bit addressing on), my system locks up.

DISCUSSION ----------

Claris Technical Support reports that this problem happens with all versions of MacWrite II on Macintosh systems with more than 16MB RAM. The workaround is to reduce the amount of available RAM -- to 16MB or less -- before you run MacWrite II.

Here are two alternatives to try:

1) Increase the system heap to 4MB or larger, so that you have 16MB or less of memory available. You can do this by increasing the RAM cache to 4MB or more.

2) Load other application programs into memory to reduce the available RAM to 16MB or less before running MacWrite II.

Macintosh: Hard Drives Can Cause Screen Fluctuations (2/95)

==========

Article Created: 13 January 1992
Article Reviewed/Updated: 06 February 1995

TOPIC ----------

My Macintosh has minor screen-width fluctuations when the hard drive is accessed.

DISCUSSION ----------

Minor screen fluctuations can be caused by the magnetic field fluctuations of Macintosh hard drives. This is most pronounced in compact Macintosh computers such as the Macintosh SE or Macintosh Classic.

In some cases, reducing the brightness of the screen can modulate the fluctuations. Replacement of the hard drive is a possible solution though not guaranteed to resolve the issue.

Article Last Reviewed:
Article Last Updated:

TOPIC -----

Can MPW Object Pascal or Symantec's Think Pascal read or import the source code from Turbo Pascal?

DISCUSSION -----

MPW Pascal and Think Pascal can't directly convert MS-DOS Turbo Pascal programs and run them without modification. Here's how:

1. Convert the MS-DOS based Turbo Pascal programs into text files (if they're not text files already) and copy them to your Macintosh.

2. Use MPW Pascal or Think Pascal (doesn't matter which) to recompile the programs.

You'll need to make a lot of additional changes to get the program running on the Macintosh. The actual complexity depends on how much non-standard Pascal calls are used and how many of those calls are not available on the Macintosh side.

Apple Monitors: ELF Emissions Not Affected by Refresh Rate

==========

Article Created: 13 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Is there a correlation between a monitor's DPI resolution and ELF emissions?

DISCUSSION ----------

The refresh rate (the number of times a video image is refreshed on the screen) determines the frequency at which ELF is emitted, but the refresh rate does not increase the amplitude or levels of ELF emitted from the monitor. Crisp color graphics require a wider video bandwidth than text-based systems, so there is the possibility of increased VLF and high frequency emissions, but the ELF spectrum remains unchanged.

Apple's products are constantly tested and compared against existing and proposed international standards. We continuously follow scientific developments in the field of computer health and safety. Ethernet Cards: GOSIP Compliance

==========

Article Created: 13 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Do Apple Ethernet cards conform to the GOSIP (US Government Open Systems Interconnection Profile) standard developed by the Government before the Open System Standard was announced.

DISCUSSION -----

According to the GOSIP standard (FIPS PUB 146), GOSIP does not mandate any specific physical interface standard for the Physical Layer. As far as the Link Layer is concerned, Apple Ethernet cards should conform to GOSIP, since GOSIP requires that the data link layer protocols be selected by the Acquisition Authority, including from the High Level Data Link Control (HDLC), Link Access Procedure B (LAP B), in conjunction with X.25 [NBS 1,3; ISO 26], and ISO 8802/2 in conjunction with ISO 8802/3, ISO 8802/4, or ISO 8802/5 [NBS 1; ISO 28-31].

There are many requirements in GOSIP regarding the upper layer, which software is not all available for the Macintosh platform. For example, the Application Layer covers Association Control Service Elements (ACSE) which support all applications, File Transfer, Access, and Management Protocol (FTAM), and Message Handling System.

Apple IIGS: RAM's Effect on Reconnecting to Server After Crash

==========

Article Created: 13 January 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I have a 1MB and a 1.25MB Apple IIGS computer on an AppleShare network. When these computers crash with an application open, the 1MB and 1.25MB models behave differently:

- The 1.25MB Apple IIGS always reboots correctly from the server.

- The 1MB Apple IIGS has to be turned off completely for 30 seconds to a minute before it can re-connect to the server. Trying to re-connect before waiting causes the 1MB Apple IIGS to hang on the "Welcome to the IIGS" greeting.

I've placed a 256K Memory Expansion Card in a different 1MB Apple IIGS with no problem rebooting. Also, when shutting down the AppleShare server, the notification of loss of server services is shown on the 1MB Apple IIGS as if it has a good connection to the server.

DISCUSSION -----

We assume you are talking about 1MB on the Apple IIGS' logic board rather than 256K on a 1MB Apple IIGS expansion board.

The newer 1MB logic board of the newer Apple IIGS does indeed use less power than the previous 256K logic board. It is not necessarily the RAM chips that stay powered, but the several CMOS chips and capacitors on the logic that retain the voltages. There is no solution for your problem other than to fully expand the memory with a RAM card to create more of a power drain -- or, as you have discovered, leave your 1MB computers off for the 30 seconds after you have a crash.

Security: Everyone

LaserWriter: How To Fix Incorrect Margin Settings (8/95)

==========

Article Created: 15 April 1992
Article Reviewed/Updated: 15 August 1995

TOPIC ----------

A customer reported that images printed from his LaserWriter IIf are not centered on the page. A test page that was generated when he turned on his LaserWriter was shifted to the right approximately 3/16 inch.

I tested our LaserWriter IIg, and we're getting the same results as the customer.

DISCUSSION ----------

Caution:
========
If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

This is a common problem with LaserWriter printers when they are assembled from their engine and controller components, and it has been reported with recent shipments of LaserWriter IIf/IIg printers. The margins may be out of adjustment and may need calibration. You can do this using the PostScript setmargins operator. Here's the syntax:

```
  <yoffset>  <xoffset>  setmargins
```

Positive integers increase the top and left margins; negative numbers decrease them. Each unit is a single device pixel (1/300 inch), or roughly 1/4 point. Changes are seen only in increments of 16 on the original LaserWriter engine used with the LaserWriter and LaserWriter Plus.

The setmargins operator is in statusdict, and must be executed outside the server loop so its changes will persist across power cycles. The following PostScript code can be used as a sample -- it shifts the image up and to the

left 16 and 24 pixels, respectively. It first exits the server loop and, therefore, modifies the parameters in EEPROM (Electrically Erasable Programmable Read-Only Memory) or ZPRAM (Zero Power RAM).

```
serverdict begin 0 exitserver
statusdict begin
-16 -24 setmargins
```

Care should be taken with the LaserWriter, LaserWriter Plus, LaserWriter IINT, and LaserWriter IIf/IIg because their controllers store parameters in a memory device with limited writes. Though these printers can handle at least 10,000 writes (the LaserWriter IIf/IIg over 50,000), automating the process in a batch file or PostScript program can quickly shorten the life. They still will work after this occurs, but they will use default settings and any new settings will need to be downloaded after each power cycle.

By altering the margin values, you should be able to properly center the LaserWriter page image. Note that the setmargins operator has no effect on total image size; it just alters its position on the page.

The following PostScript code prints a page showing the current margin settings. You may want to print this page before you modify the original settings, though they are likely to be set to zero (for both x and y) as shipped from the factory.

Begin_Table

```
/str 32 string def     %Define a 32 character string for later use.
/Times-Roman findfont  %Lookup font in fontdict and push it on stack
15 scalefont setfont   %Push size, scale, and make it the current font.
72 700 moveto          %One inch over, and 700 72nds up.
statusdict begin       %We'll be using two operators from statusdict.
(Margins for )         %Push the leading text on the stack.
show                   %Show the topmost string from the stack at 72 700.
str                    %Push an empty string of 32 length on stack.
printername            %Puts the LaserWriter name in the string.
show                   %Show it.
72 680 moveto          %Move back to 1 inch left, and down 20 points.
margins                %Push top and left margins onto stack.
(  Xoffset set to: )   %Push leading string onto stack.
show                   %Show it.
str                    %Push an empty string.
cvs show               %Convert left margin into the string and show it.
72 660 moveto          %Do the same thing again for the top margin.
(  Yoffset set to: )
show str cvs show
clippath stroke        %Draw a frame around the page border
showpage               %spit out the page.
```

End_Table

To download these programs, copy or type them into a text document using your favorite editor (the comments following the % characters aren't necessary).

TeachText or any editor that can save as text works fine. Then use the LaserWriter Utility, version 7.0 or later, or a similar utility to download the PostScript file to your LaserWriter.

Article Change History:
15 Aug 1995 - Made formatting changes and included PostScript disclaimer.

LaserWriter Driver 7.1.1 and Clone PostScript Interpreter Probs

Revised: 4/20/92
Security: Everyone

LaserWriter Driver 7.1.1 and Clone PostScript Interpreter Probs

==========

Article Created: 16 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Does LaserWriter driver 7.1.1 fix the compatibility problems with some clone PostScript interpreters and LaserWriter driver 7.1?

DISCUSSION ----------

No. This new driver does not address the compatibility problems between LaserWriter driver 7.1 and some third-party printers because this is not a 7.1 driver problem. This is an issue with the clone PostScript interpreters (PhoenixPage and TrueImage) these printers use, and which deviate from the Adobe standard interpreter.

Apple is working with the companies that sell these interpreters to provide a fix. Until a fix is available, Apple recommends that you continue using LaserWriter driver 7.0.

ImageWriter II: Troubleshooting Poor Print Quality

Revised: 4/20/92
Security: Everyone

ImageWriter II: Troubleshooting Poor Print Quality

==========

Article Created: 15 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have an ImageWriter II in for repair. When the customer prints in Faster or Best mode, about once every four pages the characters in a line of print either look squashed together or there's a fine white line running horizontally through the center of them.

DISCUSSION ----------

Here are some things you can try:

1) For the best print quality, place the stack of paper behind the printer. The paper should have a clear, unobstructed entry and exit path.

2) Ensure that the power cord and printer cable are not obstructing the paper path.

3) Ensure that the manual paper sensor isn't exerting too much pressure on the paper.

4) Ensure that the paper guide isn't exerting too much pressure on the paper.

5) Ensure that the tractor assembly is working properly and that the paper isn't slipping.

6) Ensure that the print-head gap is correct (see "Shims" in Section 5, Additional Procedures, in the Technical Procedures).

7) Ensure that the paper bail isn't exerting too much pressure on the paper.

8) Set a top and bottom margin of 1 inch (the areas where the squashed line or misregistration problems will be most apparent).

9) Try using 20-pound paper.

Apple IIc: How to Determine If It Needs ROM Upgrade for UniDisk

==========

Article Created: 14 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have an Apple IIc, and I want to purchase a UniDisk 3.5 to use with it. My dealer said that some of the earlier Apple IIc computers need a ROM upgrade to support the UniDisk 3.5.

How can I determine if my Apple IIc needs the upgrade without bringing it to the dealer?

DISCUSSION ----------

Check your Apple IIc serial number. The Apple IIc systems that require the ROM upgrade for UniDisk 3.5 support are those with serial numbers lower than F6051GFA2S4000.

Another way to determine if your Apple IIc needs the ROM upgrade is to go into BASIC and type "PR#7" and press Return. If the Apple IIc responds with "AppleTalk Offline", you have the new ROM. If it tries to start up an external drive or returns "Check Disk Drive", you have the old ROM.

Your Apple service provider will perform the ROM upgrade free of charge.

TokenTalk 2.4 Drivers: Problem with 4MB Cards

==========

Article Created: 9 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

We're showing more reliable speeds and connections on LocalTalk than on Token Ring. When we access the Chooser under LocalTalk, all zones show up and all devices respond immediately. After switching to TokenTalk, the zones don't show up right away, and the devices are slow in responding when the zones and devices appear. Devices also disappear at times. None of these problems occur while under Avatars, Lanway 4/16 TokenTalk card, or LocalTalk. These are all running on the same 4MB ring.

DISCUSSION -----

It sounds like you've upgraded to TokenTalk 2.4 (NSI 1.2). We're experiencing problems with the TokenTalk 2.4 drivers with the 4MB cards. The 4/16MB cards seem to function fine in an environment with well-behaving Novell server/routers.

A bug in the Novell 3.11 server prevents communicating with them unless you install a special NLM on the server. Search for the article titled, "Apple Internet Router: ATTOKLLC.NLM in Source Routing Token Ring" for installation instructions.

To fix the problems:

1) Everyone revert to TokenTalk 2.2 using the Ethernet NB 2.5.1 Installer or System 7.0.x.

2) Locate all of the Novell servers and make sure they have the correct NLM installed.

Laserdiscs: Controlling them from Macintosh (12/95)

==========

Article Created: 27 March 1992
Article Reviewed/Updated: 22 December 1995

TOPIC ----------

Which Pioneer laserdisc players can I can use with the Pioneer Movie Maker program to make a controlled QuickTime movie?

I read in the QuickTime documentation on Making QuickTime Movies, that it only needs a serial-port controllable laserdisc player. A device called The Box (from Voyager) allows the Macintosh to control consumer laserdisc players using the Macintosh computer's serial box. I was wondering if this would work.

DISCUSSION ----------

A Macintosh can control a laserdisc player, and have the video output captured and converted to a QuickTime movie. The application you use needs to have a device driver for the laserdisc player you're using.

Pioneer Movie Maker

This is a controlled capture system developed by Apple Computer for the QuickTime developer CD-ROM. It's a tool for content and application developers -- not for end-users. It requires a Pioneer model 4200 or 8000 laserdisc player.

- The 8000 works with CAV discs or CLV discs that have extended time codes on them.

- The 4200 works only with CAV discs. Plug the laserdisc player into the modem port and set it to 4800 baud.

The Box

You need this only if your laserdisc player has no serial port. It

connects to the Macintosh and uses the remote control capability of the laserdisc player. Contact The Voyager Company for compatibility information.

TOPIC ----------

Does the AppleCD 150 support Foreign File Access?

DISCUSSION ----------

Yes.

The AppleCD 150 has the same internal mechanism as the AppleCD SC Plus.

CDs using ISO 9660 and High Sierra formats provide faster file location than those implementing HFS. Foreign File Access handles the conversion of File Manager calls to ISO 9660 and High Sierra discs.

LaserWriter IIf/g: RAM and Legal Size Pages

==========

Article Created: 23 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What happens if I print a legal size page on a LaserWriter IIf with 2MB RAM? Is it cropped, or do I get an error message?

Why can't a 2MB LaserWriter IIf print a legal size page when the LaserWriter IINT can?

DISCUSSION ----------

In this situation, the LaserWriter IIf generates no error message and clips the document to lettersmall (7.89 x 10.30 inches) dimensions.

The LaserWriter IIf and LaserWriter IIg use PostScript level 2. PostScript level 2 requires more memory than PostScript Level 1. A LaserWriter IIf needs 3MB of RAM to have the same page size capabilities as the LaserWriter IINT.

AFP Volume: File Limits (9/95)

Revised: 9/8/95
Security: Everyone

AFP Volume: File Limits (9/95)

==========

Article Created: 9 April 1992
Article Reviewed/Updated: 8 September 1995

TOPIC ----------

Is there a practical limit to the number of files and folders on an AFP volume? I am interested in having some AFP server (such as a UNIX computer) with many gigabytes of storage, but would like all of the files to appear to users as a single file system. Would AFP limit how deep or wide the catalog tree could be in this type of situation?

DISCUSSION ----------

The AppleTalk Filing Protocol (AFP) has the following limitations:

Maximum Volume Size:	4 gigabytes
Maximum File Size:	2 gigabytes
Maximum Number of Files and Folders:	65,536

There are no limits to how deep or wide a catalog tree can be as long as there are no more than 65,536 files and folders (sub-directories).

IMPORTANT: For users running the Mac OS older than version 7.5 and using a Macintosh as an AFP client, the maximum volume size must not exceed 2 Gigabytes (the maximum volume size supported by the Mac OS older than 7.5). For System Software 7.5.1 users, the maximum volume size has been increased to 4 gigabytes. Software 7.5.2 users can address volumes up to 2 terabytes but there is no supported AppleShare solution to serve volumes of that size.

NOTE: Under AppleShare client software older than version 3.5, the maximum volume size the AppleShare client software will support is a few hundred thousand bytes less than 2 gigabytes (2,147,483,648 bytes). Apparently there was a small bug in the AppleShare client software that caused it to have problems when accessing volumes that are 2GB in size. This problem was fixed with the release of Macintosh System Software 7.5 which includes AppleShare client software version 3.5.

Something else to consider, it typically is not very efficient to use multi-gigabyte storage devices without using partitions to cut down on the size of the volumes in use.

AIR: ATTOKLLC.NLM in Source Routing Token Ring (8/95)

Revised: 8/22/95
Security: Everyone

AIR: ATTOKLLC.NLM in Source Routing Token Ring (8/95)

==========

Article Created: 9 April 1992
Article Reviewed/Updated: 22 August 1995

TOPIC -----

I'd like some information on the Novell NLM called ATTOKLLC.NLM. It's needed in Source Routing Token Ring installations that also have Apple Internet Routers (AIR). How do I get the NLM? How is it installed?

DISCUSSION -----

Novell Technical Support sent this information about the ATTOKLLC.NLM that should be loaded whenever the server is on a Token Ring network with Source Routing and an Apple Internet Router. You should get the ATTOKLLC.NLM from Novell.

Here are the installation instructions included with the NetWare for Macintosh 3.01 READ.ME file:

ISSUE: When the AppleTalk router in APPLETLK.NLM is on a multi-ring Token Ring network on which Apple Internet Routers and IBM Source Routing Token Ring Bridges are present, the router requires that a special NLM, provided with this package, be run to communicate with Apple Internet Routers.

CAUSE: The Apple Internet Router sends an 802.2 Test/Poll packet to a node when it needs to discover the Token Ring route (across bridges) to that node. It waits to receive an 802.2 Test/Final (reply) packet, which contains the Token Ring route information, before sending AppleTalk packets to the node. APPLETLK.NLM does not reply with a 802.2 Test/Final packet.

SOLUTION: If you are running NetWare for Macintosh v3.12 on a NetWare v3.12 server and you need Token Ring support, you do not use the file ATTOKLLC.NLM described in the NetWare for Macintosh Installation and Maintenance guide. Instead, you must install and load the file LLC8022.NLM. When you consult the manual, read all references to ATTOKLLC.NLM as LLC8022.NLM.

If you are running the 200-user version of NetWare for Macintosh v3.12 on a NetWare v3.11 server, you must still copy and load the file ATTOKLLC.NLM as described in the NetWare for Macintosh Installation and Maintenance guide.

Install ATTOKLLC.NLM, which listens for and responds to these Test/Poll packets. This NLM is not installed automatically during the NetWare for Macintosh v3.01 installation. To install this NLM, you must manually copy ATTOKLLC.NLM from the NW-MAC diskette to the SYS:SYSTEM directory of the server(s) on which the NetWare for Macintosh v3.0 or v3.01 software is installed. You should then load ATTOKLLC.NLM and bind it to the Token Ring board that handles the "TOKEN-RING" frame type, as described below.

After installing ATTOKLLC.NLM, follow these steps:

1) Load the frame type "TOKEN-RING" for the Token Ring LAN driver being used for AppleTalk. (This is the default frame type used when the board is loaded, but it is not the frame type used by APPLETLK. If you are running IPX and APPLETLK over the same Token Ring, this frame type is already loaded.)

2) Load the Token Ring Source Routing NLM "ROUTE.NLM" for the Token Ring board with the "TOKEN-RING" frame type. Note that this is not the same logical board to which APPLETLK is bound. Note also that you must perform this step even if you are running IPX on this Token Ring board.

3) Load ATTOKLLC.NLM. There are no options for this NLM.

4) Bind ATTOKLLC to the Token Ring board handling TOKEN-RING frames. Note that this is not the same logical board to which APPLETLK is bound.

For example, if you have already configured AppleTalk on Token Ring as follows:

```
load token int=2 port=320 frame=token-ring_snap name=tsnap
load route board=1
bind appletlk to tsnap net=10-10 zone={"Paris"}
```

The following lines demonstrate the four steps described above:

```
#Step 1.   load token int=2 port=320 frame=token-ring name=tring
#Step 2.   load route board=2
#Step 3.   load attokllc
#Step 4.   bind attokllc to tring
```

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Personal LaserWriter NTR: Sharing Options

Revised: 4/20/92
Security: Everyone

Personal LaserWriter NTR: Sharing Options

==========

Article Created: 9 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I understand that I can network the Personal LaserWriter NTR with Macintosh computers, and connect to a PC Windows environment through the parallel port as a one-to-one printer. But can I share the Personal LaserWriter NTR within the MS-DOS PC environment? Does it have to operate within the Windows environment? Will it work in a Novell PC network?

DISCUSSION ----------

The Personal LaserWriter NTR has three different ports available for connection with computers. Of these, you can only use the mini-8 connector to share it with multiple computers. You must configure it for AppleTalk communication.

The DB-25 and parallel ports accept input from standard computer interfaces, but these have no standards for a bus or network configuration. Printer sharing boxes do exist, and will likely work with the NTR, but we haven't tested any of these. The only other way you can share the DB-25 and parallel ports is by connecting the NTR to a spooler that accepts jobs from networked computers. Novell NetWare has such a spooler.

Note: Because you can independently configure all three ports, you can always share the Personal LaserWriter NTR with at least three different computers, without using AppleTalk. You can set the mini-8 and DB-25 ports to serial, and the parallel port always accepts parallel input. With the mini-8 port configured for AppleTalk, the NTR can support an AppleTalk network of computers in addition to a serial and a parallel connection.

Using the mini-8 connector in LocalTalk mode allows any AppleTalk node to

print, whether Macintosh, MS-DOS, or otherwise. The only requirement is that the client support AppleTalk PAP (Printer Access Protocol) printing. A product that provides this capability for MS-DOS is PhoneNET Talk, by Farallon Computing, Inc. Windows isn't at all necessary for this to work, but Windows applications tend to be more PostScript aware since PostScript drivers are included with Windows. This makes those applications more likely to support the full capabilities of the NTR.

Configuring the NTR for a Novell installation varies, depending on the NetWare server. However, it will be very much the same as configuring other LaserWriter models for this task. The connection could be through any of its ports, and it can then accept input from Macintosh or PC computers that have access to the NetWare server.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

A/UX 3.0: Compatibility with Other Software (10/94)

==========

Article Created: 6 April 1992
Article Reviewed/Updated: 3 October 1994

TOPIC ----------

I need to know what kind of compatibility to expect for A/UX 3.0 with the following software:

- Databases: Oracle, Informix, Sybase, Ingres (Which versions?)
- Motif from ICS (Does the version for A/UX 2.0.1 work under 3.0?)
- DAL (which version and which databases?)
- SoftPC

DISCUSSION ----------

Oracle

The current version of Oracle for A/UX is version 6.0.

Informix

According to Informix, the Informix 4.0 DBMS products for A/UX that include the tools, Informix-SQL and Informix-4GL, and the engines Informix-Online and Informix-SE, are the current released products.

Sybase

According to Sybase, four SQL tool sets currently support A/UX. These are:

- APT (Application Productivity Tools) Workbench, version 4.0.2
- Open Client C (DB Library), version 4.0.2
- Data Workbench, version 4.1
- Report Execution, version 4.1

Contact Sybase for more information.

The Ask Group, Inc./Ingres Products (formerly Ingres)

According to Ask/Ingres Sales, the Ingres for A/UX 2.0 stopped shipping September '91. We don't know why.

Motif

Motif from ICS for A/UX works on both A/UX 2.0.1 and 3.0.

DAL

The DAL server for A/UX, version 1.3 is the current released version that supports Informix 4.0 and 2.1, and Oracle DBMS.

SoftPC and Compilers

According to tests, SoftPC by Insignia was found to be compatible but may have cosmetic bugs.

To locate a vendor's address and phone number, use the vendor name as a search string.

MacTCP 1.1: Server Addressing and Routing Information Field

Revised: 7/17/92
Security: Everyone

MacTCP 1.1: "Server" Addressing and "Routing Information" Field

==========

Article Created: 13 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I have a question about "Server" style addressing under MacTCP 1.1, and the "Routing Information" field. I'm using a Gatorbox CS Rack, and all of the DDP/IP functions seem to be working fine. I'm a little confused though, about what seems to be a new feature.

Using Server mode addressing, and selecting the LocalTalk icon in MacTCP, and the correct zone to find the IPGateway (LocalTalk side of Gatorbox), I restart my system. It obtains an address fine, and displays it in the MacTCP address field (which seems to be a very nice new feature).

I'm confused about the address of the DDP/IP gateway (Gatorbox) now appearing in the "Routing Information" field. I've believed for several years now that this field had nothing to do with the DDP/IP Gateway. This was an address of a true TCP/IP router that would forward IP traffic to IP networks beyond the local one. I also understood this function required it, when not using RIP for local TCP/IP routing.

Why is this address displayed? I know that with Server-based addressing, the DDP/IP gateway is the device that needs to be used for truly setting the default route information. Does this "Routing Information" field have two purposes now, depending on which address method I'm using?

DISCUSSION -----

You're correct about MacTCP 1.1 now displaying new information when using a DDP/IP gateway (server mode addressing). MacTCP 1.1 now displays the IP address of the DDP/IP gateway in the default gateway field of the MacTCP control panel device. MacTCP 1.1 also displays the IP address received from the DDP/IP gateway in the IP address field of the MacTCP control panel

device. This new behavior in no way affects the way you configure or use MacTCP in a DDP/IP gateway environment. The additional information now presented is useful as a feedback mechanism, and nothing more.

LaserWriter: Token Ring and NetPort or SprintTALK/25T (7/93)

Revised: 7/27/93
Security: Everyone

LaserWriter: Token Ring and NetPort or SprintTALK/25T (7/93)

==========

Article Created: 20 April 1992
Article Reviewed/Updated: 23 July 1993

TOPIC ----------

I'm exploring the possibility of using an Intel NetPort to connect LaserWriters to Token Ring via the serial port (or parallel port on the NTR).

What products are available to connect LaserWriters to Token Ring?

DISCUSSION ----------

There are no products available to connect a LaserWriter directly to a Token Ring network. One solution available is Digital Products' SprintTALK/25T, or to locate the printer behind a Token Ring-to-LocalTalk or Token Ring-to-Ethernet router.

The NetPort won't work unless you only want to print to the printer from Novell servers. You may be able to configure a Novell server that has the AppleTalk NLM installed to print to a printer attached to the NetPort. In that case, it would be easier and more direct to just attach the printer to the Novell server. If you have Novell servers installed, you may want to explore this further.

SprintTALK/25

SprintTALK/25 lets you directly connect Macintosh computers and LocalTalk compatible printers to an Ethernet or Token Ring network. While other Ethernet print servers limit you on the number of printers you can connect, SprintTALK/25E provides support for up to eight printers. SprintTALK/25T provides the industry's only fast, easy, and inexpensive conversion of TokenTalk to LocalTalk.

You may locate the AppleTalk devices anywhere that's convenient, because SprintTALK/25 is also a single zone router, Macintoshes and other LocalTalk

devices can also be connected and accessed. Any Macintosh on the network can see and print to any connected printer via the standard Macintosh "Chooser" window, users don't have to operate network software or change queues.

NetPort Description

NetPort is a print server for NetWare 2.x and 3.x token ring networks running at either 4 or 16 Mbits/sec. You can connect to two printers anywhere on the network without shutting down the file server. NetPort is completely transparent to users and takes up no workstation or file server memory. The server is fully self-contained, including microprocessor, memory, NIC, and one serial and one parallel port. Print server software in the NetPort eliminates the need for a NetWare VAP or NLM. The unit's flash memory allows configuration updates via software, rather than replacing ROM chips. The NetPort is also available for thin coaxial, thick coaxial, and twisted-pair Ethernet versions. Contact Intel Corp. Personal Computer Enhancement Division for more information.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

VT100 Emulation, 56KB Line, and Internetworking

Revised: 7/17/92
Security: Everyone

VT100 Emulation, 56KB Line, and Internetworking

==========

Article Created: 20 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I want to tie a Macintosh network (for example, AppleShare or Ethernet) into a 56KB line for the purpose of VT100 emulation for two purposes:

- An electronic time card system running on a 3090 with a TCP/IP front end.

- A UNIX-based E-mail system running on several types (Sperry 5080, Sperry 5095, Gould 9000, and Pyramids).

The standard PC setup includes using VT100 emulation through remote bridges (using Xyplex devices).

I have no idea how to set VT100 up as a gateway. And, would I need to set up a separate gateway for the time card system, or could the two be combined?

DISCUSSION ----------

The choice of an application for the Macintosh is easy. Choose any MacTCP-based application that supports VT100 emulation (almost all of them do). You might consider the Intercon or Wollongong commercial products, or the widely-used NCSA public domain package. You might also consider a CommToolBox-based application. You could use any CommToolBox-based communications program (such as MacTerminal 3.0, VersaTerm Pro, and so on), and a telnet tool available from a variety of sources (like the VersaTerm product that ships with a telnet tool, InterCon, and so on).

Connecting the two networks together is also a simple task. You need to choose a router product that supports both Ethernet and high-speed serial links. The router will need to support IP routing at the minimum, and

depending on the other requirements, might also need to support other protocols as well.

You need to know how many users will be connected, and what their usage patterns will be before choosing specific products. Topology is also a major consideration:

- What, if any, other routers are installed on the network?
- Are you routing AppleTalk?
- Do you have more than one Ethernet network?
- Are there any users connected on LocalTalk?

There are a number of technological alternatives for internetworking to choose from. Network managers should base their decisions on levels and quality of service, in addition to price. Factors to consider in the selection include:

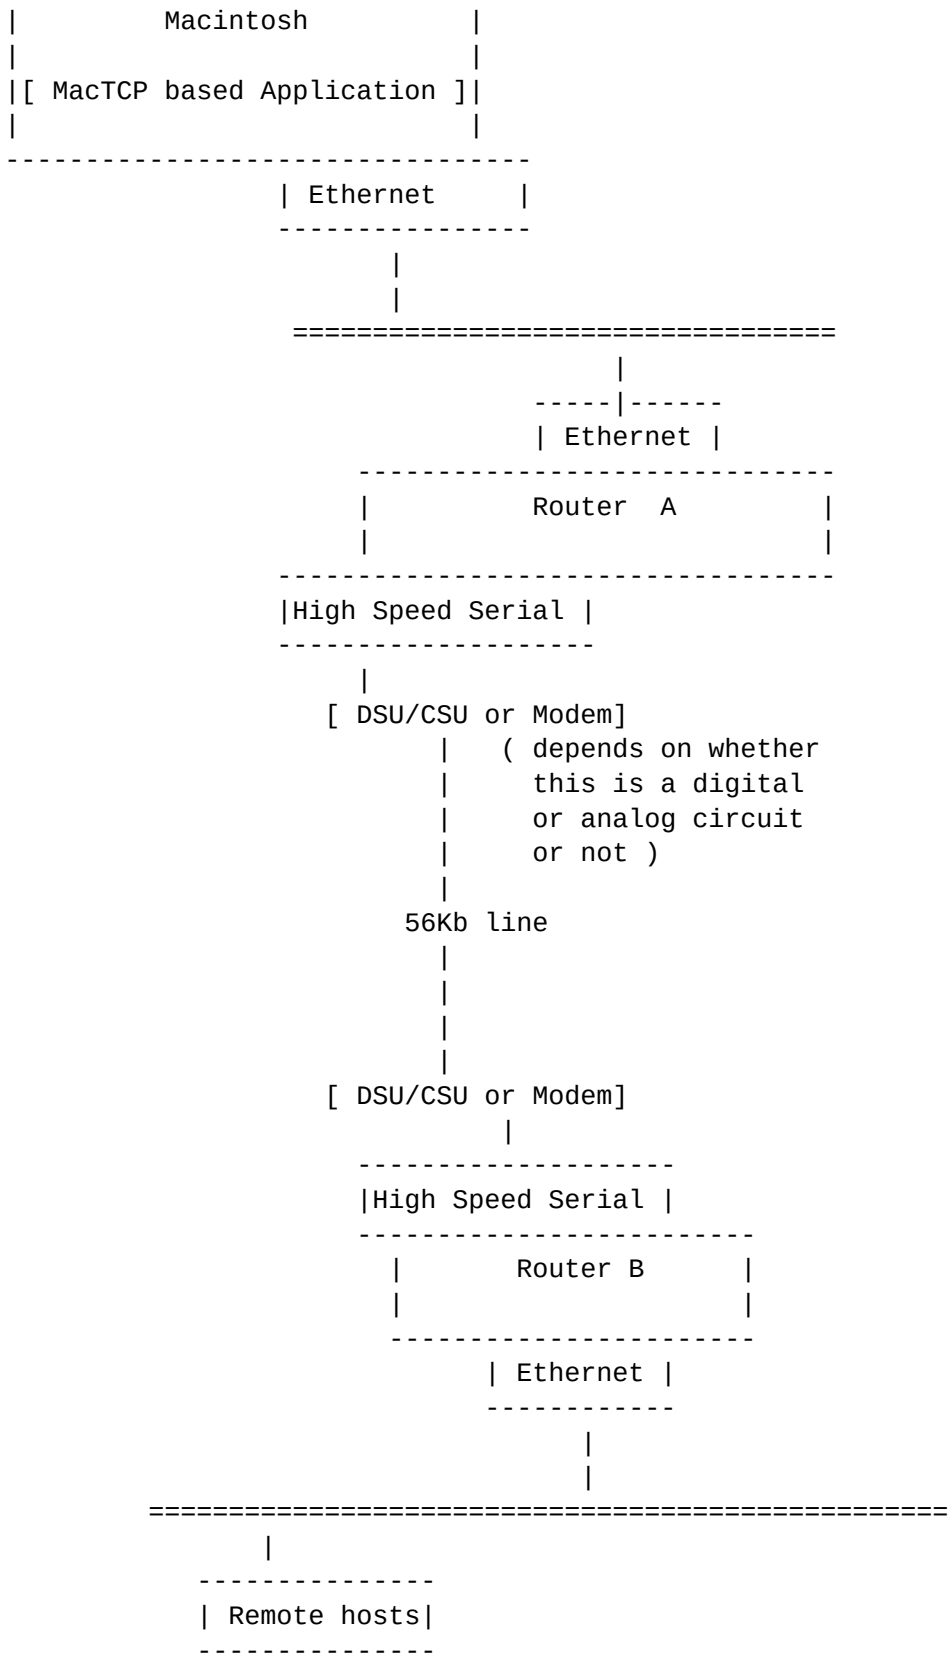
- User need for almost real-time service between linked networks
- What protocols provide the required services
- Matching the hardware to the applications used on the networks, and compatibility of the hardware with the network protocols
- Operating system and physical layer
- Security
- Technology-specific issues
- Whether users require near real-time access across network boundaries (Will slower packet-switching services suffice?)

The choice will largely depend on the expected traffic through the router and existing topology considerations. There are several high-end routers for heavy usage environments, and there are a few low-end routers capable of supporting high-speed serial links. Cisco is the industry leader, and is the router we use internally at Apple. Cisco offers a full range of products. This article includes a brief description of products from Cisco as well as other vendors.

If the environment calls for the use of a DDP/IP router, the CommTalk by APT would be an excellent choice. The router doesn't support native TCP/IP routing, although it does provide a DDP/IP gateway which all AppleTalk connected Macintosh computers can use for IP services. The DDP/IP gateway provides a mechanism for MacTCP-based applications to encapsulate IP packets in AppleTalk DDP packets. This allows an existing Macintosh network with AppleTalk-only routers to communicate with computers using the IP protocol anywhere on the connected IP network.

The CommTalk router is available in several configurations, both as a local and remote router. It's configurable for up to 6 local network attachments, either Ethernet or LocalTalk, and 1 high-speed serial port for wide area communications. The CommTalk supports speeds up to 1.544MB (T1) on the high-speed serial port.

So what we have now is this:



Note: Router A and router B must speak a compatible protocol over the high-speed serial connection.

Product Information

- cisco Systems AGS+
  AGS + is a TCP/IP, DECnet, Apple, and IPX router for Ethernet, Token Ring, and FDDI. For WAN connections, it supports RS-232, V.35, RS-422, frame relay, SMDS, X.25, and T-1. The router can simultaneously bridge. This 32-port router can forward 20,000 pps. It uses the RIP, OSPF, IS-IS, BGP, FGP, IGRP, or RTMP routing protocols.

- cisco Systems CGS
  CGS is a TCP/IP, DECnet, Apple, and IPX router for Ethernet, Token Ring, and FDDI. For WAN connections, it supports RS-232, V.35, RS-422, frame relay, T-1, satellite, microwave, X.25, RS-449, X.2 1, and SMDS. It can simultaneously bridge. This four-port router can forward 20,000 pps. It uses the RIP, OSPF, IS-IS, EGP, GRP, IGRP, or RTMP routing protocols.

- cisco Systems IGS
  IGS is a TCP/IP, DECnet, Apple, and IPX router for Ethernet. For WAN connections, it supports RS-232, V.35, RS-422, frame relay, T-1, satellite, microwave, X.21, RS-449, and SMDS. The router can simultaneously bridge. It can forward 6,000 pps. It uses the RIP, IS-IS, IGRP, BGP, or EGP routing protocols.

- cisco Systems MGS
  MGS is a TCP/IP, DECnet, Apple, and IPX router for Ethernet, Token Ring, and FDDI. For WAN connections, it supports RS-232, V.35, RS-422, frame relay, T-1, satellite, microwave, X.25, X.21, RS-449, and SMDS. The router can simultaneously bridge. This 11-port router can forward 20,000 pps. It uses the RIP, OSPF, IS-IS, IGRP, EGP, BGP, or RTMP routing protocols.

- Hewlett-Packard HP, HP ER
  The HP (HP 27270A) and HP ER (HP 27285A) are TCP/IP, DECnet, Apple, IPX, X.25, and XNS routers that support RS-232, V.35, RS-422, T-1, and X.21 WAN connections. They use RIP. The HP router runs on Ethernet and Token Ring networks, while the HP ER runs on Ethernet. Both can simultaneously bridge. A two- to 16-port router can forward 8,500 pps, and the HP ER, a four-port router, can forward 9,000 pps.

- Network Systems 6000 Series
  The 6000 Series RISC includes TCP/IP, DECnet, Apple, IPX, XNS, and OSI bridge/routers for Ethernet, Token Ring, and FDDI. For WAN connections, they support RS-232, V.35, frame relay, T-1, T-3, SMDS, satellite, and microwave. Each router can forward 15,000 pps for Ethernet and 50,000 pps for FDDI. The routers use the RIP, OSPF, or IS-IS protocols.

- Newbridge Networks
  8100 MULTIPROTOCOL The 8100 Multiprotocol is a TCP/IP, DECnet, Apple, IPX and XNS router for Ethernet, Token Ring, and FDDI networks that supports RS-232, V.35, RS-422, frame relay, T-1, and X.25 WAN connections. It can simultaneously bridge. This router can forward 14,800 pps. It uses RIP.

- Proteon CNX 500
  The CNX 500 is a TCP/IP, DECnet, Apple, IPX, XNS, Domain, and OSI bridge/router for Ethernet, Token Ring, and FDDI. For WAN connections, it supports RS-232, X.35, RS-422, T-1, PPP, and X.25. It can simultaneously bridge. This six-port router can forward 25,000 pps. The CNX 500 uses RIP or OSPF.

- Proteon P4100
  The p4100 is a TCP/IP, DECnet, Apple, IPX, XNS, Domain, and OSI bridge/router for Ethernet and Token Ring. For WAN connections, it supports RS-232, V.35, RS-422, T-1, X.25, PDN, and DDN. The router can simultaneously bridge. This four-port router can forward 3,000 to 4,000 pps. It uses RIP or OSPF.

- Proteon P4200
  The p4200 is a TCP/IP, DECnet, Apple, IPX, XNS, Domain, and OSI router for Ethernet, Token Ring, and FDDI. For WAN connections, it supports RS-232, V.35, RS-422, T-1, and SMDS. This nine-slot router, with up to 14 connections, can forward 4,000 to 6,000 pps. It uses RIP or OSPF.

- RAD Network Devices Open Gate
  Open Gate is a TCP/IP, DECnet, Apple, and IPX router for Ethernet, Token Ring, and FDDI. For WAN connections, it supports V.35, RS-422, frame relay, T-1, satellite, and microwave. The router can simultaneously bridge. This two- to 24-port router can forward 150,000 pps. It uses RIP or OSPF.

- Chipcom Online Module
  The Online router module is a TCP/IP, DECnet, Apple, and IPX router for Ethernet. For WAN connections, it supports RS-232, V.35, RS-422, frame relay, T-1, satellite, and microwave. The router can simultaneously bridge. This two-port router can forward 6,000 pps. It uses the RIP, IGRP, BGP, RTMP, ZIP, or EGP routing protocols.

- Timeplex Time/LAN 100
  Time/LAN 100 is a TCP/IP, DECnet, Apple, IPX, XNS, X.25, and DDN bridge/router for Ethernet, Token Ring, and FDDI. For WAN connections, it supports RS-232, V.35, RS-422, T-1, PPP, G.703, satellite, and microwave. It can simultaneously bridge. This 12-port router can forward 14,000 pps. It uses RIP or OSPE.

- Wellfleet Concentrator, Feeder, Link Nodes
  The Concentrator, Feeder, and Link Nodes are TCP/IP, DECnet, AppleTalk, IPX, XNS, and X.25 routers. The Concentrator and Link nodes run on Ethernet, Token Ring, and FDDI. The Feeder Node operates on Ethernet and Token Ring. They can simultaneously bridge, use RIP or OSPF, and can forward 14,5000 pps. For WAN connections, they support RS232, V.35, RS-422, X.25, SDLC, HDLC, T-1, E-1, fractional T-1, satellite, microwave, frame relay, and SMDS.

- Telebit Netblazer
  The NetBlazer TCP/IP router for Ethernet networks supports RS-232, V.35,

and RS-422 WAN connections. It uses RIP. The entry-level model has three ports.

MacTCP-Based VT100 Compatible Applications

- InterCon Systems Corp.
  TCP/Connect-II

- VersaTerm-PRO
  NCSA maintains a professional-looking TELNET package for the PC and the Macintosh which supports remote login, multiple VT102 emulation, Tek 4014 emulation, subnetting, and dynamic IP address assignment via RARP.

  Features included in NCSA Telnet:
  (* means new in version >= 2.2)

  - DARPA standard telnet
  - Built-in standard FTP server for file transfer
  - VT102 emulation in multiple, simultaneous sessions
  - Full subnetting support
  - Tektronix 4014 graphics emulation
  - Scrollback for each session
  - Domain name lookup with default domain suffix
  - *RARP for dynamic IP address assignment
  - Full color support (PC and *Macintosh II)
  - *Font and size support (Macintosh)
  - *MacBinary FTP transfer (Macintosh)
  - *New Ethernet board support (PC, PS/2)

  How to obtain a copy:

  1) From a friend
     The documentation, program and source code are now in the public domain. Copy, modify, distribute.

  2) Anonymous FTP from ftp.ncsa.uiuc.edu (128.174.20.50)
     You may want to ftp the README file(s) to determine which files to transfer to your home computer.

     For the PC version, you have your choice of tar files which contain the documentation, the programs, and supporting files. For each tar file, there is also a compressed tar file with the same contents. After the files are extracted from the tar file, some transfer method (for example, kermit, NCSA Telnet) should be used to download the files to the PC. The documentation is available in line printer format, and Macintosh Microsoft Word format. Remember to download .EXE files in binary mode.

     The Macintosh version consists of several files encoded with Stuff-It. The BinHex (.HQX) version is a duplicate copy for those who need a non-binary distribution. Download the selections you need with a binary transfer method (kermit, NCSA Telnet), and extract the individual files. The documentation is in Microsoft Word 3.X format.

3) Diskette or Tape
   On-disk copies and printed manuals are available for a small fee which covers materials, handling, and postage. The anonymous FTP tape covers the contents of all disks. Orders can only be accepted if accompanied by a check in U.S. dollars made out to the University of Illinois. You can get an order form by contacting NCSA Telnet Orders.

CommToolBox-Based MacTCP Tools

These are current products available that provide telnet access for programs that use the Communication ToolBox:

- TCPack
  Supports telnet and ftp protocols.

- InterCon's Telnet Driver/Tool
  Telnet support only.

- VersaTerm-Pro
  Ships with a telnet tool

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

PowerBook Fax/Data Modem: Disabling MNP Connections (7/94)

Revised: 7/21/94
Security: Everyone

PowerBook Fax/Data Modem: Disabling MNP Connections (7/94)

==========

Article Created: 23 April 1992
Article Reviewed/Updated: 21 July 1994

TOPIC ----------

Which AT command switches MNP 5 on and off in the PowerBook Fax/Data Modem?

DISCUSSION ----------

There are several ways to disable MNP connections: Through '&Q', '%C' commands and through S register settings:

From the Macintosh PowerBook Fax/Data Modem User's Guide, page 102

&Qn Connection Mode, where if n equals (default is 5):

0	Sets asynchronous mode with no error correction protocol.
1-4	Returns ERROR.
5	Error control mode. Instructs the modem to make a connection using the V.42/MNP. If remote modem does not offer V.42/MNP, the modem falls back to standard Asynchronous mode.

From the Macintosh PowerBook Fax/Data Modem Developer's Guide, page 55

%Cn MNP 5 enable - Enables and disables MNP class 5 data compression during Reliable Mode connections. For use with MNP class 5, \L0 is mandatory, \J0 is recommended.

%C0	Disables data compression. AT%C0 sets S46 to 136.
%C1	Enables data compression (default). AT%C1 sets s46 to 138.

From the Macintosh PowerBook Fax/Data Modem Developer's Guide, page 56

• \Jn BPS adjusts to DTE speed - After connecting, when in Direct Mode, the PowerBook and the Fax/Data Modem always adjust their data rate to the one used on the communication channel (between the Fax/Data Modem and the

remote modem).

When one of the three MNP modes is set, the PowerBook normally keeps the same data rate as used in the Command State and the modem, with the help of flow control, adjusts its speed and buffers data between the communication channel and the PowerBook. This can be modified with the \J command, which can disable that buffering possibility within an MNP mode.

\J0 The modem adjusts its speed to the PowerBook; buffering is enabled (default).
\J1 The modem and the PowerBook must adjust the speed to that of the communication channel without buffering, as in Direct Mode.

• \L Service type - This command controls the MNP service type setting.

\L0 Stream (default).
\L1 Block; returns ERROR.

From the Macintosh PowerBook Fax/Data Modem Developer's Guide, page 75

• S46: Error protocol selection V.42 and V.42bis (default is 138)

0 Either LAP-M (V.42) or LAP-B (MNP).
1 LAP-B only.
2 LAP-M with adaptive data compression or LAP-B with adaptive compression.
3 LAP-B with adaptive data compression.
136 LAP-M (V.42) only.
138 LAP-M with adaptive compression (V.42bis).

All other codes return ERROR.

• S48: Feature negotiation action V.42 and V.42bis (default is 7)

0 Negotiation disabled in V.42 or V.42 bis modes only depending on S46.
7 Negotiation enabled. Start with V.42 or V.42bis and fall back to MNP if required.
128 Negotiation disabled. Force to MNP mode only.

All other codes return ERROR.

PowerBook: NEC CDR-35 CD-ROM Player Compatibility (2/95)

Revised: 2/7/95
Security: Everyone

PowerBook: NEC CDR-35 CD-ROM Player Compatibility (2/95)

==========

Article Created: 15 April 1992
Article Reviewed/Updated: 07 February 1995

TOPIC ----------

I can't make an NEC CDR-35 CD Player work with a PowerBook, although it works fine with a Macintosh LC.

DISCUSSION ----------

Neither NEC nor Apple has tested the CDR-35 with any PowerBook computer. NEC recommends the CDR-36 or later for use with the PowerBook family.

NEC Technical Support has had reports that when the Apple SCSI cable and the NEC CD-ROM drivers version 2.21 are used, the CDR-35 did work with a PowerBook. It seemed that the NEC SCSI cable didn't work. Because Apple and NEC haven't tested the CDR-35 and PowerBook computers, this isn't a supported solution.

AppleCD Family and Kodak Photo CD (8/93)

Revised: 8/3/93
Security: Everyone

AppleCD Family and Kodak Photo CD (8/93)

==========

Article Created: 15 April 1992
Article Reviewed/Updated: 3 August 1993

TOPIC ----------

There are two levels of support available for Kodak's Photo CDs. The first and most basic level is the ability to read the Photo CD itself. The second level is the ability to deal with more than just the initial session of a multisession CD. The AppleCD 300 and 300i are the first CD-ROM players from Apple to support multisession Photo CD.

DISCUSSION ----------

MODE 1 and 2

To achieve the first level, Kodak's Photo CD requires a CD-ROM drive that provides Mode 2/Form 1 services.

CD-ROM Mode 1 is the standard ability to read CD-ROMs. A CD-ROM drive must support this mode to be considered a CD-ROM drive.

CD-ROM Mode 2 allows for additional capabilities. In relation to Photo CDs, the CD-XA Form 1 is the most important element. Mode 2/Form 1 allows the Photo CD to be recognized and read.

Additional software is required to understand what is being read. Kodak's developer's toolkit helps third-party developers to add the ability to read in the Photo CD's images. QuickTime 1.5 and later allows you to use Photo CD images on the Macintosh. This allows any Macintosh with the proper software installed, and with a Mode 2/Form 1 CD-ROM drive attached, to read Photo CDs.

Multisession

To provide the multisession support, the first level must be in place and then the CD-ROM drive needs to understand to look past the "lead-out" area of the first session to find the second session's "lead-in" area.

The Photo CD concept allows the customer to send the CD back to a Kodak photofinisher to add additional images to the CD. Each time images are added to the CD, the process is called a session. Since images can be added at different times, the CD is known as multisession.

The different sessions of the multisession CD-ROM consist of a lead-in area, data, and a lead-out area. Thus a multisession CD would have repeating sequences of lead-in areas, followed by data, followed by lead-out areas. For example:

```
lead-in area
data for session 1
lead-out area

lead-in area
data for session 2
lead-out area

and so on
```

For a CD-ROM drive to read past the initial session, the drive must understand how to deal with multiple lead-in and lead-out areas. Normally, a CD-ROM will have only one lead-in/lead-out combination. This is because, traditionally, most CD-ROMs can be written to only once. Thus, most CD-ROM drives are designed to recognize one set of lead- in/lead-out areas. Once a lead-out area is located, most of the older CD-ROM drives will consider that lead-out area the end of the CD-ROM.

With newer technology available, the ability to write additional information resulted in the use of the multisession procedure (that is, the Kodak Photo CD). This procedure means that a CD-ROM drive must understand how to look past the lead-out area to see if another lead-in area exists.

The AppleCD SC (Apple's original CD-ROM drive) doesn't support the Mode 2/Form 1 format; however, if using 4.01 or higher of the CD driver, it can read any Kodak Photo CD (single session only).

The AppleCD SC Plus (Apple's second version of the CD-ROM drive) does support the Mode 2/Form 1 format; however, it doesn't support multisession. Therefore, the AppleCD SC Plus can read the Kodak Photo CD, but can only read the first session. The AppleCD SC Plus won't read additional sessions.

Like the AppleCD SC Plus, the AppleCD 150 Drive (Apple's third version of the CD-ROM drive) does support the Mode 2/Form 1 format; however, it doesn't support multisession. Similarly, the AppleCD 150 Drive can read the Kodak Photo CD, but can only read the first session. The AppleCD 150 Drive won't read additional sessions.

The AppleCD 300 and AppleCD 300i (the internal model) do support multisession Photo CDs.

..TIL10129-AppleCD_Family_and_Kodak_Photo_CD_8-93.pdf

Article Change History:
30 October 1992 - Corrected to explain that the AppleCD SC drive (original CD-ROM drive) does support a Kodak Photo CD with certain restrictions.
3 August 1993 - QuickTime 1.5 or later reads Photo CD images.

GS/OS 6.0 and HyperCard GS: Memory Requirements

Revised: 7/17/92
Security: Everyone

GS/OS 6.0 and HyperCard GS: Memory Requirements

==========

Article Created: 20 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

If I have ROM 01 IIGS, how much memory do I need to use a GS/OS application if I boot from my file server (no floppy used)?

I need to know how much memory it takes to run an Apple IIGS under GS/OS 6.0 with the following parameters:

- Full OS and a hard drive
- Boot GS/OS only, but run ProDOS applications
- Boot GS/OS and run a GS/OS application (not HyperCard)
- Boot diskette containing Local Network Startup and everything else from the server

Under 5.0.4, most things worked in 1 or 1.25MB, but I'm confused about the requirements for 6.0.

DISCUSSION ----------

The minimum configurations for GS/OS 6 are the same as for 5.0.4, although increasing RAM to 2MB will provide better performance. We don't have configuration information for the specific cases you mentioned. However, published information about GS/OS 6.0 system requirements provides the following information:

> System Requirements
>
> Standalone Apple IIGS System 6 software requires an Apple IIGS personal computer with at least 1MB of RAM, ROM version 01 or 03 and one 3.5-inch disk drive, although configurations of 2MB of RAM and a hard drive is recommended for optimal performance. Networked systems require Apple IIGS computers with at least 768K RAM, ROM version 01

or 03 and appropriate LocalTalk cables.

Exact memory requirement definition is rather dynamic because (like the Macintosh OS) you can add a variety of extensions. This makes the size of the GS/OS System file grow and shrink.

Use the "About the Finder…" menu item under the GS/OS 6 Apple Menu to find memory usage information. The About… box contains information about total memory, available memory, Finder memory usage, System, Desk Accessories and Setup files.

For example, using the "Easy Update" button in the GS/OS Installer to create a startup disk provided the following memory usage (via the About… box) in a 1MB RAM (no memory expansion card) ROM 03 Apple IIGS:

```
Total Memory     : 1152K
Available Memory :  480K
Finder           :  299K
System           :  295K
Desk Accessories :   13K
Setup Files      :   62K
```

The same startup disk on a ROM 01 IIGS with a 1MB RAM expansion card showed the following usage:

```
Total Memory     : 1280K
Available Memory :  549K
Finder           :  299K
System           :  359K
Desk Accessories :   13K
Setup Files      :   57K
```

Customize the installation to allow a larger Available Memory area and reduce the System area. The "Easy Update" installs drivers that you may not use, such as AppleDisk5.25, SCSI.Manager, SCSIHD.Driver. Not installing these would provide an additional 37K of Available Memory. You can add another 23K to Available Memory by removing all the installed CDEVs; the ROM-based Desk Accessories can handle the functions of the Easy Update CDEVs.

HyperCard GS requires 1.5MB of RAM to run on the Apple IIGS.

Macintosh LC II and IIsi: Comparing Performance

Revised: 6/21/93
Security: Everyone

Macintosh LC II and IIsi: Comparing Performance

==========

Article Created: 20 April 1992

Article Change History

06/21/93 - REVISED
- No longer includes specs on all Macintosh models. Refer to article titled "Macintosh Family: MIPS Ratings" for that information.

TOPIC ----------

I'm planning a lab for word processing as well as for desktop publishing tasks. I'm considering the Macintosh LC II or the Macintosh IIsi. What differences in performance can I expect between the two computers, since both have the 68030 processor? The performance issue is most important in the case of handling complex graphics. What would the addition of the optional math coprocessor mean to the performance of each computer?

DISCUSSION ----------

Following is the text of the AppleLink Tech Info Library article "MIPs Can be Misleading." Please remember that we don't quote MIPs values without strenuous disclaimers about their applicability in the Macintosh world.

Information pertinent to your decision is this:

Macintosh LC II	3.9	MIPs	**
Macintosh IIsi	5.0	MIPs	** ***

* NOTE: The majority of our systems operate with a variable number of wait states. See the Tech Info article on Wait States and Macintosh.

** NOTE: This figure has been adjusted to reflect the improved efficiency of the 68020 and 68030.

*** NOTE: This figure does not reflect performance degradation due to the use of internal video, or increases provided by an optional cache card.

Using these values, the Macintosh IIsi is over 25% faster than the Macintosh LC II. While we don't have specific benchmarks of performance in desktop publishing applications, it's safe to say that the speed difference would be significant.

Measuring MIPS is, at best, an inaccurate art. All the reference manuals we consulted stated that a MIPS rating can be misleading. MIPS (Million Instructions Per Second) is a measurement of CPU (Central Processing Unit) speed.

From Motorola's 68020/68030 Performance Report:

> "Benchmarking microprocessors is much like water-witching. Everyone wants to use the results but are skeptical of the 900-methods. From the user's point of view, the best benchmark to use in making a decision on a given microprocessor is to run the code which will be run in the final application. This, however, is usually difficult at best, and expensive and time consuming at least. Since running the actual code is usually not feasible, most users and all microprocessor manufacturers turn to either synthetic benchmarks - ones that simulate real-world conditions - or small standard benchmark programs which are designed to indicate real-world performance. Not everyone can agree on what simulates real conditions; thus, there are numerous benchmark programs available, each written to test some aspect of performance that the writer is interested in testing."

Another issue that causes MIPS ratings to be suspect is the fact that not all instructions take the same amount of time. A single instruction can take from 2 to over 200 machine cycles. The MC68020, for example, runs at a sustained rate of 2 to 3 MIPS, with occasional bursts of 8 MIPS.

Several other factors may enter into the process of obtaining the MIPS rating:

- Instruction in cache and cache enabled
- Instruction data size
- Addressing mode used -- extension words and indirect
- Memory port size
- Memory speed -- variable wait states
- Operand misalignment
- Prefetch sequence -- even or odd, word alignment of op word
- Instruction overlap

If a program is written to test the MIPS, other issues surface:

- Which instruction is used? The best instruction to make the MIPS rating look good would be the fastest executing instruction in the CPU set.

- What is the best program structure to use? Two choices, a loop or a straight line. A straight line program will take more space but is, by

far, the fastest. The straight line program executes only the fast instructions without executing any looping instructions.

StyleWriter: Why It Goes Off-line During Manual-Feed Printing

Revised: 7/17/92
Security: Everyone

StyleWriter: Why It Goes Off-line During Manual-Feed Printing

==========

Article Created: 21 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This question is about manual-feed printing from the StyleWriter. The printer goes into an off-line state when the user selects OK after the "Please insert a piece of paper" dialog. Then the Macintosh displays the message, "The printer is not responding."

Why does this happen?

DISCUSSION ----------

The printer goes off-line to accommodate those users feeding paper from the front of the printer. The StyleWriter doesn't have a paper sensor for the front-feed slot, so the printer takes itself off-line to allow the user to press the form feed button. The printer then pulls the paper into the paper path.

Since the printer can't tell if the user is feeding from the front or the rear, it takes itself off-line in all cases.

See the StyleWriter Owner's Guide for more explicit instruction on manual-feed printing.

LaserWriter IINT: Switch Changes Disrupt Network

Revised: 7/17/92
Security: Everyone

LaserWriter IINT: Switch Changes Disrupt Network

==========

Article Created: 20 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

When I set the DIP switch to RS-232 modeA on a LaserWriter IINT connected to a LocalTalk network, it hangs the network. No users can see servers or printers in the Chooser.

Once I set the DIP switch back to LocalTalk mode, the network carries on fine. Why is this happening?

DISCUSSION ----------

This is normal behavior, documented in the LaserWriter IINT and NTX Owner's Guide, Appendix C. When you use the DIP switches to configure the port settings, it affects both the DB-25 and mini-8 ports. When you change the switches to RS-232 mode, both ports will use this new setting. Since the RS-232 specification requires idle transmit signals to be held more negative than minus three volts, the LaserWriter will do this for both ports. If the mini-8 port is connected to an AppleTalk network when you do this, the LaserWriter will inject at least -3 volts onto one of the network signal pairs. This is very disruptive, and causes the symptoms you describe.

The LaserWriter IINTX (with version 3.0 ROM) allows software-switching between ports, and the complete disabling of one or the other port. This would allow you to leave both ports connected when changing from AppleTalk to RS-232. You can find the required steps documented in a separate article titled, "LaserWriter IINTX: How To Switch Modes Using Software" parts 1 and 2. Search for "LaserWriter IINTX and setsccbatch" in the Tech Info Library. The LaserWriter IINT doesn't have this same capability.

The LaserWriter IIf and IIg allow simultaneous connections to their

different ports, and you can configure each independent of the others. They will also automatically arbitrate between jobs arriving from the different ports. If this is an urgent matter, you may wish to consider upgrading.

System 7: Create Network Aliases from Remote Macintosh

Revised: 9/15/92
Security: Everyone

System 7: Create Network Aliases from Remote Macintosh

==========

Article Created: 11 March 1992

Article Change History

09/15/92 - CORRECTED
- To show what really happens when making an alias locally; also used information from another article.

TOPIC ----------

If I follow the procedure below, I would expect to be prompted with a log-on sequence for my Macintosh, wherever it is on the network:

1) Create an alias for a Macintosh with a hard disk named the default "Macintosh HD".
2) Copy the alias to a floppy.
3) Insert the floppy into another Macintosh with a hard disk having the same name ("Macintosh HD") as the first hard disk.
4) Double-click on the alias.

But instead this procedure opens the current hard disk.

DISCUSSION ----------

If you wish to make an alias of a file or volume that will work over a network, you must mount the desired target volume from a remote Macintosh, and then make the alias of the file or volume from the remote Macintosh. That alias can then be passed to any Macintosh on the network to access the desired file or volume. If you make the alias on the local Macintosh, it will only be a reference to a local file or volume.

For instance, if you make an alias for "Macintosh HD" from your local volume, then the alias will only contain the name "Macintosh HD". If that

alias is taken to another system with a hard disk named "Macintosh HD" then the alias will simply open that local volume.

Security Zone: Must Have 16-Character Password

Revised: 7/17/92
Security: Everyone

Security Zone: Must Have 16-Character Password

==========

Article Created: 12 March 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I installed the Security Zone zone name on a spare port of one of our MaxWay 500s, and it shows up in the Chooser.

Unfortunately, it doesn't seem to have any effect. When I click on "Answer calls" in the Remote Access Setup CDEV, it doesn't ask for password -- even if I click on "entire network."

DISCUSSION ----------

The problem probably stems from the following:

When you run the Security Zone stack, it displays the name you should give to the Security Zone. Unless the name is printed, the stack only displays 15 characters of the 16-character password. You probably have a 15-character password. Therefore, the AppleTalk Remote Access program isn't treating it as a true Security Zone. Try re-entering the zone name with the full name from the stack.

LaserWriter IIf & IIg: Adobe Changed How Helvetica Fonts Print

==========

Article Created: 30 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

We recently purchased some LaserWriter IIf and IIg printers. We also have several LaserWriter IINTX printers. Our designers have reported that the type style of documents printed with the Helvetica font to a LaserWriter IIf or IIg are different from those printed to a LaserWriter IINTX. The difference is most noticeable with characters like "g" and "o" -- one printer prints circular characters, and the other prints oval characters.

We examined the fonts in both printers with several utilities and can't find any differences. We aren't using any TrueType fonts, and we turned off both FinePrint and PhotoGrade, but the results are still the same.

DISCUSSION -----

There are slight differences in the way Helvetica fonts are printed on the LaserWriter IIf and IIg when compared to other LaserWriter printers, like the LaserWriter IINTX. Adobe changed the way Helvetica PostScript fonts print. The LaserWriter IINTX has version 001.002 of the Helvetica PostScript font, while the LaserWriter IIf and IIg have version 001.006S.

Adobe controls these PostScript font changes. They make these changes to bring their fonts more in line with the actual fonts they license from various font foundries. In the future, more and more PostScript printers will have this version of the Helvetica font. Apple is neither responsible for nor has any control over this.

Here are two things you can try:

1) Download the Helvetica font (version 001.006) from the Adobe Type Library CD to a LaserWriter IINTX. Then compare the printouts with those from the LaserWriter IIf or IIg.

2) Contact Adobe and find out if version 001.002 of the Helvetica font is still available. Download this older version to the LaserWriter IIf or IIg and compare the printouts to the LaserWriter IINTX printouts.

A/UX 3.0 and Earlier: Supported Third-Party Serial NB Cards

==========

Article Created: 30 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I would like to use a Macintosh Quadra 900 running A/UX as a multi-user UNIX system and connect 14 serial terminals to it.

I was told that I could use an Apple Serial NB Card to support four terminals. I plan to use four Apple Serial NB Cards in the Macintosh Quadra to support these 14 serial terminals.

Will this work?

DISCUSSION ----------

A/UX 3.0 and earlier does not support the Apple Serial NB Card because there is no driver available for A/UX. The driver for the Macintosh OS is not compatible with A/UX.

A/UX does support two internal serial ports (printer and modem ports). If you want additional serial ports on A/UX, there are several third-party NuBus cards available:

- CommCard by Taniwha Systems Design
- DigiChannel Nu/Xi by DigiBoard
- Hurdler Serial Boards by Creative Solutions

For more information on the cards, contact these companies directly.

On AppleLink, you can find contact information on a company mentioned in this article by clicking the "Library Index" button in the lower-center of the Tech Info Library search window, then opening the "Third Party Company Directory" folder.

Apple Scanner: Ofoto Upgrade for 32-Bit Addressing (12/93)

Revised: 12/23/93
Security: Everyone

Apple Scanner: Ofoto Upgrade for 32-Bit Addressing (12/93)

==========

Article Created: 30 April 1992
Article Change History: 23 December 1993

TOPIC ----------

I have the original Apple Scanner, and I'm using the latest version of AppleScan, which I downloaded from AppleLink. This software doesn't seem to support 32-bit addressing. How can I use the Apple Scanner and 32-bit addressing under System 7?

DISCUSSION ----------

The older versions of the Apple Scanner software do not support 32-bit addressing. To use your Apple Scanner and 32-bit addressing under System 7, you need to purchase Ofoto from LightSource, Inc., which is the software we include with our newer Apple OneScanners. This is especially important if you have a Centris 660AV, Quadra 660AV and Quadra 840AV, all which run only in 32-bit addressing mode.

Ofoto is not available as a separate product from Apple. However, there are two Ofoto upgrade kits available from LightSource: one version works only with the Apple Scanner, and the other version works with all scanners.

For more details, search on "Lightsource."

PowerBook AC Adapter, Battery Charger: Electrical Specifications

Revised: 5/17/94
Security: Everyone

PowerBook AC Adapter, Battery Charger: Electrical Specifications

==========

Article Created: 30 April 1992

TOPIC ----------

What are the electrical specifications for the Macintosh PowerBook AC Adapter (for the 100, 140, 145 and 170 line) and the Battery Recharger?

DISCUSSION ----------

The Macintosh PowerBook AC Adapter specifications are:

Input Voltage: 80 to 270 VAC (120/240 V Nominal)
Frequency: 48 to 62 Hz (50/60 Hz Nominal)
Output Voltage: 7.5 to 7.9 VDC (load-dependent)
Output Current: 0.005 to 2.0 A max.
Weight: 11 ounces
Dimensions: 2.44" wide x 1.88" high x 3.88" long

Because the Macintosh PowerBook Battery Recharger relies on the AC Power Adapter, the same voltages apply for the recharger.

Apple Equipment: See User Guides for Care and Cleaning Info

==========

Article Created: 21 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Does Apple have any recommended cleaning procedures for its equipment?

DISCUSSION ----------

The user guide or owner manual, shipped with each product, contains basic care and cleaning instructions for the user. You can find the specific page numbers for this information in the index under "care" and/or "cleaning".

Some cleaning procedures must be performed by authorized service providers. If you cannot find cleaning instructions for your particular needs in the manual, contact your authorized Apple dealer or service provider.

There is a separate Tech Info Library article on cleaning Apple floppy-disk drives, in which Apple recommends using 3M cleaning kits.

LaserWriter IIf, IIg, and NTR: Windows 3.0 Problem & Fix

Revised: 7/17/92
Security: Everyone

LaserWriter IIf, IIg, and NTR: Windows 3.0 Problem & Fix

==========

Article Created: 21 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have a Macintosh IIsi, running system software version 7.0 (without the 7.1.1 tune-up), and a 486 DOS computer, running Windows 3.0, connected to my LaserWriter IIf. I'm using the LaserWriter driver that comes with Windows.

Apple's data sheets for the LaserWriter IIf, IIg, and NTR printers state that these printers are designed so you can simultaneously connect multiple kinds of networks and computers without having to manually reconfigure the printer to receive data through a particular port.

However, when I try to print from the Macintosh, which is connected to the LaserWriter IIf LocalTalk port, after I've printed from the Windows machine, PrintMonitor shows that the LaserWriter is "processing the job from Windows", even though the job has finished printing. The only way I can print a Macintosh job after printing from the Windows machine is to physically disconnect the cable from the Windows machine to the LaserWriter. Then PrintMonitor shows that the Windows job has finished, and the Macintosh job will print.

Is this a known compatibility problem, and is there a fix?

DISCUSSION ----------

There is a compatibility problem between Windows 3.0 and the LaserWriter IIf, IIg, and NTR. You need to upgrade to Windows 3.1, which lets you choose some "advanced options" for PostScript printers.

To fix the problem, in the "advanced options" dialog box, check the "Clear Memory Per Page" option. For details, see page 84, item #8, of the

"Getting Started with Microsoft Windows" manual.

System 7 Tune-Up 1.1.1: Availability, Installation (9/93)

Revised: 9/23/93
Security: Everyone

System 7 Tune-Up 1.1.1: Availability, Installation (9/93)

==========

Article Created: 24 April 1992
Article Reviewed/Updated: 23 September 1993

TOPIC ----------

What version of System 7 Tune-Up should I use, and how should I install it?

DISCUSSION ----------

What Version To Use

Use version 1.1.1 of System 7 Tune-Up. System 7 Tune-Up 1.1 was released and then recalled because it caused unpredictable system behavior in low-memory situations.

When To Install System 7 Tune-Up

If you use System 7.0 or System 7.0.1, Apple recommends installing System 7 Tune-Up 1.1.1. System 7.1 incorporates the functionality of System 7 Tune-Up 1.1.1, so there is no need to install it.

Availability

System 7 Tune-Up 1.1.1 is posted on AppleLink; follow this path:

Software Sampler
  Apple SW Updates
    Macintosh
      System Software
        System 7 Tune-Up 1.1.1

Installation Notes

Apple recommends installing System 7 Tune-Up 1.1.1 on all Macintosh systems running system software version 7.0 or 7.0.1. The components of System 7 Tune-Up 1.1.1 were rolled into system 7.1. Therefore, it isn't necessary to

install the Tune-Up into any release of system software after that version.

If you upgrade a Macintosh with System 7 Tune-Up installed to System 7.1, the Installer will disable the Tune-Up software, but won't remove it. To save disk space, delete the Tune-Up file from your Extensions folder in the System Folder.

Before installing System 7 Tune-Up 1.1.1 on your Macintosh, read the entire ReadMe file on the Tune-Up disk or the System 7 Tune-Up Version 1.1.1 Installation Instructions included in the Tune-Up 1.1.1 package.

To insure proper software installation, Apple always recommends installing system, printer, or network software, including System 7 Tune-Up 1.1.1, via the Installer. There are only a few unusual circumstances when you wouldn't use the Installer.

Be sure to install the System 7 Tune-Up software last. System 7 Tune-Up was released AFTER AppleTalk Remote Access, and it contains newer System 7 resources (System 7 tuner, LaserWriter, StyleWriter 7.2.2, File Sharing Extension 7.2, Chooser 7.1, and various system software patches). If you don't install System 7 Tune-Up last, AppleTalk Remote Access will install older versions of some of these resources. Shared computers may not appear in the Chooser.

During System 7 Tune-Up installation, AppleTalk is set to "Inactive" in the Chooser. You need to set AppleTalk to "Active" in the Chooser, and restart your Macintosh. Then you'll be able to open the Network control panel, and avoid the message that "AppleTalk Remote Access has not been properly installed" when you try to use it.

The first time you start your computer with Extensions on WITH Tune Up 1.1.1 installed, the System 7 Tuner installs an INIT resource into the System file. You can only see this INIT resource with a tool like ResEdit. After that first install, you can boot with Extensions off and you are still protected from the disappearing folder problem. The INIT loads from the System file regardless of whether Extensions are on, BUT the System 7 Tuner MUST be in the Extensions folder. If you throw away your system and reinstall, you will be unprotected until you start up with Extensions on WITH Tune Up 1.1.1 installed.

System 7 Tune-Up 1.1.1 installs these files:

- System 7 Tuner 1.1 extension (new for version 1.1.1)
- LaserWriter 7.1.1 driver (new for version 1.1)
- StyleWriter 7.2.2 driver (no change)
- Chooser 7.1 (no change)

System 7.x.x: AppleTalk and ADSP Versions (10/95)

Revised: 10/17/95
Security: Everyone

System 7.x.x: AppleTalk and ADSP Versions (10/95)

==========

Article Created: 27 April 1992
Article Reviewed/Updated: 17 October 1995

TOPIC ----------

What versions of AppleTalk and ADSP are included with System 7 and later versions of System software? Are there any newer versions available? If so, what benefits do they provide?

DISCUSSION ----------

AppleTalk version 56 (part of System 7), the ADSP stack is integrated with the rest of the AppleTalk stack.

The AppleTalk versions for System software 7.x.x are as follows:

- System 7 and System 7.0.1 come with AppleTalk v56. System 7 Tune-Up 1.1.1 does not change the version of AppleTalk installed.
- System 7.1 comes with AppleTalk v57.0.4.
- Both System 7 Pro and System 7.1.2 come with AppleTalk version 58.1.1.
- System 7.5 comes with AppleTalk version 58.1.3

The latest version of AppleTalk is v58.1.6 and is available on the PowerBook 190 and 5300 series computers. The latest Network Software Installer (NSI) is 1.5.1 which installs AppleTalk v58.1.5. AppleTalk v58.1.5 should be used except for the PowerBook 190 and 5300 series, or PCI-based Power Macintosh computers (7200, 7500, 8500, 9500) which requires Open Transport. (Search on Network Software Installer for specific content information.)

Below is a history of AppleTalk and ADSP version since System 7.0.

AppleTalk v57.0.1 and ADSP v57.0.1 changes

- Added support for multiple DDP addresses on a single computer.
- Some code was changed to be MC68040 friendly for the new Macintosh Quadra systems.

- Minor modifications to retry timer handling were made in both NBP and ATP. This should reduce traffic due to retransmissions on slower network links (2400 to 19.2KB serial lines).
- The Network Control Panel no longer allows you to select LocalTalk if the printer port is already open by another application.
- Reliability and performance of LocalTalk on Macintosh Plus systems has been improved.

AppleTalk v57.0.3 and ADSP v57.0.3 changes

- Improved support for MC68040-based computers.
- Support for the Macintosh PowerBook power-down modes.
- Smaller RAM footprint in the system heap.
- Performance improvements to the AppleTalk Transaction Protocol (ATP) to reduce network traffic when used with links such as AppleTalk Remote Access using 9600-bps modem.
- AppleTalk Data Stream Protocol (ADSP) and AppleTalk Session Protocol (ASP) now support AppleTalk Remote Access. Sessions with computers on the remote end of a phone connection will be torn down when the phone connection is broken.
- A bug was fixed in ATP which could cause an AppleShare client or file server to "hang" if any data wasn't received in the first attempt.

AppleTalk v57.0.4 and ADSP v57.0.4 changes

- A fix for a bug in ATP that could cause incoming GetRequest packets with a checksum to be dropped. This affects machines running fileshare if the client is sending packets with DDP checksums.
- A fix for ADSP so that an openRetries count of 255 actually means "infinite retries", as specified in the documentation, rather than 255.
- Improved performance under VM (virtual memory)
- Improved File share and AppleShare performance over LocalTalk.

AppleTalk v58 and ADSP v58 changes

- Adds support (instrumentation) for SNMP. Also includes continuing support for Apple's Router.

AppleTalk version 58.1.1 (NSI 1.4.1-no change to ADSP)

- A problem that existed with the LocalTalk SNMP byte counting code that would cause an occasional bus error was fixed. It was wrongly assumed that was ALWAYS a WDS pointer and that address was used to calculate the byte counts.
- Check for Slotless networking devices when coming out of sleep for the PowerBook Duos.
- Lap Manager only intercepts packets for SAP 0xAA or 0x00. An attempt will be made to deliver any packet for a destination SAP that is not 0xAA or 0x00 to the SAP listener. If no SAP listener is found, then the packet will be ignored. A check in LLCAttach was added for duplicate SAP or SNAP addresses. If so, then an error is returned.

AppleTalk version 58.1.4 changes

- The LAP Manager was fixed to avoid sending corrupted TEST and XID response packets in certain heavy traffic situations.

AppleTalk version 58.1.5 changes

- An address-mapping problem that could cause slowdowns in EtherTalk or TokenTalk networks was fixed.
- The LAP Manager was fixed to avoid sending corrupted TEST and XID response packets in certain heavy traffic situations.
- A bug that passed a corrupted length indication to multi-node clients was fixed.
- A VM problem that could cause hangs was fixed (this could also have occurred when Ram Doubler was active).
- A LocalTalk problem on Power Macintosh computers was fixed that prevented LaserWriter Bridge from working properly.
- An additional LocalTalk problem on Power Macintosh computers was fixed that caused slow performance when both LocalTalk and GeoPort were in use.

AppleTalk version 58.1.6 changes

- Included support for built-in infrared technology (IRTalk) found on the PowerBook 190 and 5300 series computers.

Article Change History:
17 Oct 1995 - Added AppleTalk 58.1.5 and 58.1.6 revisions.
13 Jan 1995 - Updated to show version of AppleTalk in System 7.5.
28 Mar 1994 - Added information on NSI 1.4.3 and new AppleTalk version.

LaserWriter and HP Emulation: Switching Character Pitch

Revised: 7/20/92
Security: Everyone

LaserWriter and HP Emulation: Switching Character Pitch

==========

Article Created: 27 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I'm using a Personal LaserWriter NT, in RS-232 mode, set to HP Emulation. It won't toggle into 12cpi using PCL escape sequences.

Sending codes from a BASIC program:

```
   CHR$ 27,38,107,50,83      for 16cpi
   CHR$ 27,38,107,48,83      for 10cpi
   CHR$ 27,38,107,52,83      for 12cpi and this one does not work.
```

All other settings work, but 12cpi can't be set. The command is just ignored.

DISCUSSION -----

Hewlett Packard has provided more than one set of codes to switch character pitch in their different levels of PCL. The emulator used in our LaserWriter models was originally designed by Adobe as a LaserJet+ emulator. As such, it doesn't support some more recent command additions. Specifically, the sequences ESC&k0S and ESC&k2S are interpreted as requesting standard and compressed font pitch, respectively. Values other than 0 or 2 are ignored. This is why you saw that the value of 4 produced no change in output.

However, other code sequences do exist to switch character pitch. The sequence ESC(snH does this for the primary font, where n is the desired number of characters per inch. Note that a real LaserJet will pick a built-in font that is as close as possible to the requested size, but may very well not have the right one available. The emulator uses PostScript to obtain its different character sizes, and is therefore able to provide

precisely scaled characters at any size.

Examples:

```
ESC(s10H    sets 10 characters per inch.
ESC(s12H    sets 12 characters per inch.
ESC(s16.6H  sets 16.6 characters per inch.
ESC(s2.2H   sets 2.2 characters per inch.*
ESC(s24H    sets 24 characters per inch.*
```

*On a real LaserJet+, these would produce output far from that requested since the font in that pitch wouldn't exist unless downloaded.

DAL for MVS/VTAM Server: Tuning Hints and Tips

==========

Article Created: 27 April 1992
Article Last Reviewed: 18 June 1992
Article Last Updated: 18 June 1992

TOPIC ----------

I need information on tuning the VTAM connection to improve the performance of the DAL VTAM server.

DISCUSSION ----------

The following is the file containing tuning hints and tips for the VTAM server. You can find it on the DAL for MVS/VTAM Server distribution tape in the DAL.RUN.JCL file as the member, TUNING. An additional member, README, can also be of assistance. It is also recommended that all the tracing and log files be removed from the execution JCL.

DAL MVS/VTAM SERVER TUNING HINTS AND TIPS.

COPYRIGHT 1992, APPLE COMPUTER, INC.

THE FOLLOWING INFORMATION CAN BE USED TO HELP YOU OBTAIN THE BEST RESULTS FOR THE DAL MVS/VTAM SERVER, VERSION 1.3.5.

* CALCULATING STORAGE REQUIREMENTS (REGION SIZE)

THE DAL MVS/VTAM SERVER REQUIRES 808K OF STORAGE WITH NO SESSIONS CONNECTED. EACH CONCURRENT SESSION REQUIRES A MINIMUM OF 260K. TO CALCULATE THE REGION SIZE TO SUPPORT THE DESIRED NUMBER OF CONCURRENT SESSIONS FOR YOUR ENVIRONMENT, USE THE ABOVE FIGURES AND ADD TEN PERCENT FOR OVERHEAD. EXAMPLE: TEN CONCURRENT SESSIONS WILL REQUIRE A REGION SIZE (REGION= ON JOB STEP) OF 3749K. SEE BELOW ON THE MAXIMUM NUMBER OF

SESSIONS CONNECTED TO A SINGLE SERVER.

* 31-BIT ADDRESSING AND MAXIMUM NUMBER OF SESSIONS

THE DAL MVS/VTAM SERVER DOES NOT CURRENTLY SUPPORT 31-BIT ADDRESSING. THIS MEANS THAT THE SERVER CANNOT OPERATE IN A REGION SIZE LARGER THAN 16M (I.E., "ABOVE THE LINE"). THEREFORE, USING THE STORAGE ESTIMATION PROCEDURE GIVEN ABOVE, THE MAXIMUM NUMBER OF SESSIONS SIMULTANEOUSLY CONNECTED TO THE SERVER IN A 16M REGION IS 52; FOR A 9M REGION THE NUMBER OF SESSIONS WOULD BE 28.

* MULTIPLE DAL MVS/VTAM SERVERS ON THE SAME CPU

MORE THAN ONE MVS/VTAM SERVER CAN BE RUN AT THE SAME TIME ON A SINGLE CPU (GIVEN THE LIMITS OF YOUR ENVIRONMENT). USING MORE THAN ONE SERVER WILL ALLOW FOR GREATER THAN 63 CONCURRENT SESSIONS. IF MULTIPLE SERVERS ARE USED, THE CLIENT SCRIPTS (HOSTS.CL1 PRIOR TO SYSTEM 7.0 AND DAL PREFERENCES UNDER SYSTEM 7.0) MUST REFERENCE THE APPROPRIATE APPLID(S). TO ACCOMPLISH THIS, EACH SERVER MUST HAVE A UNIQUE VTAM APPLID ASSIGNED TO IT. YOU WILL NOT NEED TO PERFORM A COMPLETE INSTALLATION FOR EACH APPLID (AND ITS ASSOCIATED SERVER) AS THE LOADLIB, AUTOEXEC, AND ENVIRONMENT FILES MAY BE SHARED BETWEEN MULTIPLE SERVERS. REFER TO THE "DATA ACCESS LANGUAGE FOR MVS/VTAM INSTALLATION AND OPERATION GUIDE", AS WELL AS TO THE APPROPRIATE IBM PUBLICATIONS, FOR MORE INFORMATION ON VTAM APPLIDS AND SERVER FILES. REFER TO THE "DATA ACCESS LANGUAGE FOR THE MACINTOSH INSTALLATION AND USER'S GUIDE" FOR MORE INFORMATION ON THE HOSTS.CL1 (DAL PREFERENCES) FILE.

* SECURITY

THE DAL MVS/VTAM SERVER MUST BE AN AUTHORIZED TASK ON THE HOST SYSTEM IN ORDER TO IMPLEMENT SECURITY (PASSWORD) VERIFICATION. AUTHORIZATION PROCEDURES ARE EXPLAINED IN THE "DATA ACCESS LANGUAGE FOR MVS/VTAM INSTALLATION AND OPERATION GUIDE" AS WELL AS THE APPROPRIATE IBM PUBLICATIONS. USE OF THIRD-PARTY PROGRAMS TO BYPASS THE NORMAL AUTHORIZATION PROCEDURE (I.E., REFERENCE TO THE LOAD MODULE IN A SYS1.PARMLIB MEMBER) IS NOT SUPPORTED BY APPLE, AND RESULTS MAY BE UNPREDICTABLE.

* USE OF DB2 THREADS

THE DAL MVS/VTAM SERVER REUSES THE AVAILABLE THREADS WITHIN THE HOST DB2 SUBSYSTEM. EACH CONCURRENT SESSION REQUIRES ONE THREAD, WHICH IS RELEASED UPON COMPLETION OF THE DATABASE TRANSACTION (E.G., SELECT, COMMIT). THE NUMBER OF AVAILABLE DB2 THREADS IS SPECIFIED DURING INSTALLATION OF THE DB2 SUBSYSTEM. REFER TO THE APPROPRIATE IBM PUBLICATIONS FOR MORE INFORMATION.

Article Last Updated:

TOPIC --------------------

This article gives the technical specifications for the AppleCD 150 drive.

DISCUSSION --------------------

Playback Medium
- 12-cm optical disc installed in a CD caddy (any CD-ROM or audio compact disc is compatible)

Capacity
- Mode 1: 656MB
- Mode 2: 748MB
- Recording surfaces: 1
- Data/block (available to user)
  Mode 1: 2,048 bytes
  Mode 2: 2,336 bytes
- Blocks per disc: more than 270,000

Audio Playback
- Playing time: more than 1 hour
- Frequency response: 20 to 20,000 hertz

Characteristics
- Average access time: 380 milliseconds
- Full stroke access time: 650 milliseconds (typical)
- Data streaming rate
  Mode 1: 150KB/second
  Mode 2: 171KB/second
- Block rate: 75 blocks/second
- SCSI bus transfer burst rate: 1.5MB/second
- Rotational speed: 230 to 530 rpm

Interfaces
- Two SCSI 50-pin connectors for connection to the Macintosh and other SCSI devices
- One headphone jack
- Two RCA audio output jacks for external amplifier or amplified speakers

Electrical Requirements
- Power requirements: 100 to 240 volts AC, 50 to 60 hertz
- Power consumption: 0.25 amps (drive on)

Operating Environment
- Temperature: 41 to 104 degrees F (5 to 40 degrees C)
- Relative humidity: 10% to 90% noncondensing

Non-operating Environment
- Storage temperature: -22 to 122 degrees F (130 to 55 degrees C)
- Transportation temperature: -22 to 131 degrees F (130 to 55 C)
- Relative humidity: 5% to 95% noncondensing

System Requirements
- A Macintosh Plus or later model Macintosh
- Macintosh system software 6.0.5 or later

Size and Weight
- Height: 1.95 inches (4.9 cm)
- Width: 7 inches (17.75 cm)
- Depth: 12.9 inches (32.5 cm)
- Weight: 6.5 lb. (2.9 kg)

Quadra 900 & 950: Unplug Before Installing NuBus Card (11/94)

Revised: 11/11/94
Security: Everyone

Quadra 900 & 950: Unplug Before Installing NuBus Card (11/94)

==========

Article Created: 23 April 1992
Article Reviewed/Updated: 11 November 1994

TOPIC ----------

Why must I unplug the Macintosh Quadra 900 before installing a NuBus card?

DISCUSSION ----------

The Macintosh Quadra 900/950 power supply provides a +5-volt trickle voltage to one pin on the NuBus slot when the computer is connected to AC. One reason for this is to allow remote startup.

If the computer is not unplugged during the installation procedure, the power supply, the logic board, and/or the NuBus card may be damaged.

Consult your Macintosh Quadra 900 or Macintosh Quadra 950 Owner's Manual for the proper expansion card installation procedure.

Note: This caution does not apply to the Macintosh Quadra 700.

AppleColor RGB Monitor (IIGS): Not Compatible with Mac Systems

==========

Article Created: 29 April 1992
Article Last Reviewed: 3 June 1992
Article Last Updated:

TOPIC ----------

Can I use my AppleColor RGB Monitor (for the Apple IIGS) with a Macintosh?

DISCUSSION ----------

No. The AppleColor RGB Monitor (IIGS) is not compatible with Macintosh computers.

The vertical and horizontal sync rates supported on Macintosh video cards and by the built-in video provided with certain models, like the Macintosh LC/LC II and Macintosh IIsi, are not compatible with those of the AppleColor RGB Monitor (IIGS).

PowerBook: Rechargeable Battery Safety Notice 7/92

==========

Article Created: 30 April 1992
Article Reviewed/Updated: 31 July 1992

TOPIC ----------

This article addresses a safety concern about the Macintosh PowerBook Rechargeable Battery.

DISCUSSION ----------

Because of the high-energy capacity of the Macintosh PowerBook Rechargeable Battery pack, accidental shorting of the brass contacts at the corner of the battery pack can quickly generate enough power to cause burns or start a fire.

When the battery pack isn't either in the computer or in the recharger, the pack should be kept in an insulating carrying case.

If your battery pack didn't come with an insulating carrying case, call 800-377-4127 or visit your Apple dealer to obtain a free carrying case (part number 076-0590).

ImageWriter II: Command for Disabling Perforation Skip

==========

Article Created: 29 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Is this the ImageWriter II command code to DISABLE perforation skip?

ESC D CTRL @ CTRL D or $27 68 00 04

(as shown on page 144 of the ImageWriter II Technical Reference Manual)?

DISCUSSION ----------

The string of "ESC D CTRL @ CTRL D" is indeed the correct command string to disable the perforation skip.

This command works only if the perforation skip was enabled via software. In other words, you must set the ImageWriter II DIP switches so that perforation skip is disabled. If you enable the perforation skip with the string "ESC Z CTRL @ CTRL D" you can disable it with the string "ESC D CTRL @ CTRL D".

HyperCard 2.1: Some Menu Items Can't Be Disabled (& Workaround)

==========

Article Created: 1 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Some HyperCard 2.1 menu items can't be disabled. For example, the command

```
disable menuItem "New Card" of menu "Edit"
```

doesn't function. This is also true of "Delete Card" and "Cut Card"
An obvious workaround is to DELETE the item instead.

DISCUSSION ----------

Claris is aware of the limitation; it is intentional.

There are more elegant workarounds than deleting the menuItem.
The best is to rename the item in question, and then disable it. See the
HyperTalk code below:

```
on openBackground -- or in some other handler
  put "Can't Delete Card" into menuItem "Delete Card" of menu "Edit"
  disable menuItem "Can't Delete Card" of menu "Edit"
end openBackGround
```

This is probably the best way to deal with the issue because it tells the
user specifically that the option isn't available. Otherwise, the user may
wonder if something is wrong with the menu.

You could also add a handler for doMenu...

```
on doMenu which
  if which = "Delete Card"
  then
```

```
        beep -- or put up a dialog informing user
      else
        pass doMenu
      end if
   end doMenu
```

MacApp 3.0: Last Release That Supports Pascal

==========

Article Created: 30 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Does MacApp version 3.0 support Pascal?

DISCUSSION -----

MacApp 3.0 supports Object Pascal. However, this is the last release of MacApp that will work with Pascal because of a new Linker being implemented. A new Object Pascal compiler would need to be developed in order to be compatible, and there are no plans to develop such a compiler. Thus, it is strongly recommended that developers convert their code to C++ in order to continue using MacApp.

DAL: Problem with Async Login Sequence

==========

Article Created: 29 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm currently working with an account to design a DAL Prefs file that will allow them to dial and log into one VAX and then use the VMS "SET HOST" command to connect to a second VAX (which is the DAL server).

I have been told that this can't work. I had it working once, but was not able to duplicate. This is the script:

```
rem:: This is a custom VMS async login sequence for remote attachment via
decnet

BPACM1:async:com1:9600:Noparity:8databits:2stopbits:Boxonxoff:128:Nomodem
BPACM1:login:2tries:lo:6000:600:\r\^y\w2:\r:\w2\r\r\MODIFY ?\sC
CIMTS\r\w2\MASSWORD\sPASS\r\w2\MPLETE\r\r\r\r\w2\Msername>\u\r\w2\Mocal>\sC
BPACM2\r\w2\Msername\u\r\P\Massword\p\r\w2\M$\sSET HOST
BPACM1\r\Msername\u\r\P\Massword\p\r\M$

rem:: NEW SCRIPT SET TO PROVIDE SET HOST FACILITY.

EVERYTHING works up to the end of the script;

<15:13:43>
    Last interactive login on Monday, 27-APR-1992 15:11
<15:13:44>
Processing System Login on BPACM1
<15:13:45> Z[c[0c
<15:13:46>
%SET-W-NOTSET, error modifying RTA1:
```

```
<15:13:47>
-SET-I-UNKTERM, unknown terminal type
<15:13:48> Z[c[0c
<15:13:49>
%SET-W-NOTSET, error modifying RTA1:
<15:13:50>
-SET-I-UNKTERM, unknown terminal type
<15:13:52> Z[c[0c
<15:14:03>
%SET-W-NOTSET, error modifying RTA1:
<15:14:04>
-SET-I-UNKTERM, unknown terminal type
<15:14:06>
HEMEL READY    ---------------------------- END OF VAX LOGIN
<15:14:07>

<15:14:07> $
<15:14:07> Cuslogin done (0)
<15:14:07>  dalsvr pktasync
<15:14:08>
SYNC
<15:14:35>
1: Connection to host 'BPACM1' failed.
<15:14:36> 1: Error #-10628 (0) async (DAL Preferences)
<15:14:36> 1: Message: .
<15:14:36> 1: Disconnected.

at 15:14:08;
```

What does the SYNC mean? Is this a DAL command failing to execute? I have had it work once and was able to access an Ingres DB.

DISCUSSION ----------

A DAL asynchronous login will run through all the set up for the user account when used as a terminal. This includes commands like "SET TERMINAL/INQUIRE" that DAL doesn't like.

The error "%SET-W-NOTSET, error modifying RTA1:" you received is from trying to do a SET TERMINAL on the remote terminal RTA1, which you normally get when logging in over terminal servers or SET HOST.

You should check both your SYLOGIN.COM and LOGIN.COM and bypass any setting for interactive terminal sessions. A typical DCL command to do this is:

```
$ IF F$MODE() .NES. "INTERACTIVE" THEN GOTO ENDINTER

.....Put all interactive terminal settings here

$ ENDINTER:
```

MacTerminal: Using VT Tools in 8-bit Environment

Revised: 7/20/92
Security: Everyone

MacTerminal: Using VT Tools in 8-bit Environment

==========

Article Created: 1 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

We want to receive characters from the full 8-bit Macintosh character set on MacTerminal. The files are text files, and come from a non-Macintosh computer.

We can transfer the file to the host with no problems. But downloading the same file strips off the 8th bit! We've tried various tools, VT102, and VT320. We don't want to use a standard file transfer like XMODEM, as that isn't too stable on this system.

DISCUSSION ----------

The VT102 Tool doesn't support 8-bit character sets because it emulates the DEC VT102 terminal that doesn't.

The VT320 Tool does support 8-bit character sets in an 8-bit environment with 8-bit control characters. To set this mode, select the "Terminal..." menu item under the Settings menu. Select VT300 (8-bit) from the Terminal Mode pop-up menu.

Also, make sure that the terminal port on the host is set for 8-bit support. In the VAX/VMS environment, for example, use the following DCL command to force the host to pass all data, including tabs, carriage returns, line feeds, and control characters, as binary data.

```
$ SET TERMINAL/PASTHRU portno:
```

where portno is the terminal port number such as TXA1:

A/UX: Mounting DOS CD-ROMs

==========

Article Created: 30 April 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What issues are involved with accessing DOS CDs from SoftPC or Orange Micro boards, running under A/UX 3.0? I noticed that putting the CD extensions in the A/UX Macintosh System Folder disabled A/UX. But without them, I can only mount Apple CDs.

DISCUSSION ----------

A/UX can mount ISO 9660 and High Sierra CD-ROMs in the Finder as Macintosh volumes. Then you can use SoftPC's E: drive to mount the CD under DOS. This may or may not solve your problem, depending on the software you're using to access the information on the CD. This is because DOS will see the CD as if it were just another hard drive.

To mount foreign CD-ROMs under A/UX, you must have the "Foreign File Access" extension in the active System Folder or Extensions folder, along with the appropriate FFA documents: ISO 9660 and High Sierra in the ROOT LEVEL of the System Folder (NOT in the Extensions Folder). But DON'T use the "Apple CD-ROM" extension under A/UX.

Apple IIc: Description (Discontinued)

==========

Article Created: 1 May 1992

TOPIC ----------

This article describes the Apple IIc computer (now discontinued).

DISCUSSION ----------

The Apple IIc is a compact personal computer about the same size as a loose-leaf notebook, small enough to fit in a briefcase, and light enough to carry with you. It has 128K of RAM, a built-in disk drive, and a full-size keyboard. It runs thousands of programs from the Apple II software library.

Features

- 128K RAM and 16K ROM
- Enhanced version of the processor used in the Apple IIe
- Built-in 5.25-inch disk drive
- Full-size keyboard that produces the entire ASCII character set in both 80-column and 40-column formats.
- Three separate color graphic modes
- Built-in speaker with volume control and a headphone jack
- Two built-in serial ports for adding a modem and printer, as well as built-in connectors for attaching a mouse, joystick, hand controllers, second disk drive, and television display
- External (floor-mounted or table-mounted) power unit
- Built-in Applesoft BASIC programming language

Macintosh II Family: How the ADB Keyboard Power-On Switch Works

Revised: 6/5/92
Security: Everyone

Macintosh II Family: How the ADB Keyboard Power-On Switch Works

==========

Article Created: 7 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Can you explain how the power-on switch on the ADB keyboard works for the Macintosh II family of computers?

DISCUSSION -----

The power-on switch on these Macintosh computers does not simply connect and disconnect AC power to/from the power supply. Instead, these computers have a power-control circuit that turns on the power supply in response to a signal from the ADB keyboard.

When you press the power-on switch on the ADB keyboard, a capacitor discharges, generating a signal to the power supply that causes the power supply to turn itself on and begin functioning normally within 1.5 to 2.0 seconds. The capacitor is kept charged by two 3-volt lithium batteries.

In the Macintosh IIcx and Macintosh IIci, the capacitor is kept charged by a trickle current from the power supply. If the capacitor in a Macintosh IIcx or Macintosh IIci is completely discharged, it takes approximately 5 seconds to charge, once AC power is applied to the power supply.

Assuming that a Macintosh IIcx or Macintosh IIci is unplugged for an extended period, the system would required approximately 5 seconds from the time it is plugged in before the power-control circuit could turn on the power supply, and another 1.5 to 2.0 seconds for the system to come on once the power-on switch is pressed.

System 7: How to Find Amount of Memory an Application is Using

==========

Article Created: 7 May 1992

Article Change History

08/21/92 - REVIEWED
- For technical accuracy.

TOPIC ----------

How can I tell exactly how much memory an application is using?

DISCUSSION ----------

To find out exactly how much memory an application is using:

1) Turn on Balloon Help. (Choose "Show Balloons" from the "?" menu.)

2) If the application you want to check isn't open, launch it.

3) In the Finder, choose "About This Macintosh" from the Apple menu.

4) Point at the appropriate thermometer for the application you are checking.

   The balloon shows both the amount of memory being used by the application and the amount of memory allocated to the application.

System 7: Using Apple Menu for Quick Access to Programs & Files

==========

Article Created: 7 May 1992

Article Change History

08/21/92 - UPDATED
- With alias information.

TOPIC ----------

I'm looking for a quick way to access some applications and files that I use frequently.

DISCUSSION ----------

For quick access to files that you use frequently, including programs, folders, documents, and so on, put them in the Apple Menu Items folder in your System Folder. Then you'll be able to choose them from the Apple menu. If you want the applications or documents to continue being available in their previous folders, just place an alias of the application or file in the Apple Menu Items folder.

Because items in the Apple menu are sorted alphabetically, you can group items in the Apple menu by adding a unique character, such as space or "√" or "Δ" or "•", to the beginning of filenames.

SCSI Device Tips

==========

Article Created: 7 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

This article provides some general tips for using SCSI devices.

DISCUSSION -----

- Disconnect, from your computer, any SCSI devices you don't want to start.

- Turn on ALL SCSI devices connected to your Macintosh -- even those you're not using -- to avoid problems.

- Turn on SCSI devices before you start up your Macintosh.

- Do not turn off SCSI devices until after you've shut down your Macintosh.

- Ensure that the SCSI chain is properly terminated. A terminator is required on the last available port in a SCSI chain (provided the device is not internally terminated).

- Ensure that each SCSI device in the chain has a different ID number. There are eight SCSI ID numbers available.

  - ID number 0 is assigned to the Macintosh internal hard drive.
  - ID number 7 is assigned to the Macintosh.
  - ID numbers 1-5 are available for the other SCSI devices in the chain.

System 7.x: Desktop File Rebuilding and Icon Recovery (8/95)

Revised: 9/30/96
Security: Everyone

System 7.x: Desktop File Rebuilding and Icon Recovery (8/95)

==========

Article Created: 7 May 1992
Article Reviewed/Updated: 18 August 1995

TOPIC ----------

This article describes the desktop file, when and how to rebuild it (such as when your icons change to "generic" document or application icons), why the desktop file sometimes will not rebuild, and what to do in this case.

DISCUSSION ----------

What is the Desktop File?

The Desktop file is an invisible file found in the main level of your hard drive. It is the file that keeps track of all the documents and applications that are on your drive.

The file name is desktop for versions of System 6 and earlier. System 7.0 and later versions use the invisible files named Desktop DB and Desktop DF.

When to Rebuild the Desktop File

Occasionally your Desktop file may become too large or may be damaged.

NOTE: It is generally a good idea to rebuild your Desktop file once a month or so.

Symptoms of a Damaged Desktop File

One symptom of a damaged Desktop file is icons on your desktop appear as "generic" rather than "custom" icons. Rebuilding the Desktop file may eliminate the problem.

The Desktop file manages all icons on a particular hard drive or floppy disk. When you insert a new or customized icon, the Desktop file may not load it or may load a previous version of the icon. To have the special icon appear on the desktop, the Desktop file must be rebuilt to update the Desktop file and register the icon.

Icons change to generic document (blank page with a corner turned down) or application (diamond with a hand) icons for several reasons, including the following:

• Utilities such as compression or security software can alter icons.

• Custom icons become damaged or deleted.

• The Desktop file has been damaged.

• Applications that create files may not assign icons to the files.

• An application that created a file and assigned an icon may no longer be available.

• A file may have lost the bit that indicates a custom icon (this is known as the bundle bit).

Symptoms of a Large Desktop File

If the Desktop file becomes too large, the computer may have difficulty reading it efficiently and speedily. This can cause the Finder to access files more slowly. Rebuilding the Desktop file can clean up old information and speed up Finder access.

You can also make a file-by-file backup of the drive, re-initialize the drive, and then restore the files. This re-groups all the files, unfragments them, and increases the efficiency of the drive.

How to Rebuild the Desktop File

Rebuilding the Desktop relinks documents to their correct applications and rewrites the Desktop file itself.

Before rebuilding the Desktop, be sure that you have some room available on the hard disk. The Desktop rebuilding process requires hard disk space, and does not successfully complete without it. A good guideline is to always have 5% of the hard drive or other volume available as free space.

This procedure only works when the Finder is loaded. Applications like At Ease don't load the Finder, so you must turn them off prior to rebuilding.

NOTE:
Rebuilding the Desktop file erases any comments you may have typed in the Get Info windows of files on your disk.

System 6 through System 7.1.2

You can rebuild the Desktop manually by holding down the Option and Command (Apple) keys while the system is starting up. When you see the message "Are you sure you want to rebuild the desktop file on the disk "your disk"? Comments in info windows will be lost", click okay.

System 7.5 and later

Step 1

Before you rebuild your desktop, use the Extensions Manager to save a record of the extensions that are currently turned on.
• Open the Extensions Manager control panel.
• Click on the Sets pop-up menu, and choose Save Set.
• When the Save Set dialog box opens, type a name for your currently selected extensions (for example, 'My Extensions'). When you close the dialog box, the name of your set is added to the Sets pop-up menu.

Step 2

Turn off all extensions - Click on the Sets pop-up menu again and choose All Off.

Step 3

Turn on Macintosh Easy Open - Find it in the list of control panels, click it to put a checkmark beside it.

Step 4

Restart your computer while holding down the Command and Option keys.

Step 5

When you see the dialog that says "Are you sure you want to rebuild the desktop file on the disk "your disk"? Comments in info windows will be lost," release the keys and click OK.

Step 6

When the desktop is rebuilt, click on the Apple menu and choose Control Panels.

Step 7

Open the Extensions Manager control panel.

Step 8

Turn your extensions back on - Click on the Sets pop-up menu and choose the name you gave your set of extensions in step 1 (for example, 'My Extensions').

Step 9

Restart your computer to activate the extensions.

Why the Desktop File Sometimes Will Not Rebuild

There are several reasons why you may have difficulty rebuilding the Desktop file.

A Conflicting INIT or System Extension

An INIT or system extension can interfere with rebuilding the Desktop file. To resolve the problem you can try the following:

For versions of System 6, remove all non-Apple extensions from the System Folder. Then rebuild the desktop file by holding down the Option and Command keys while starting the computer.

For System 7 through 7.1.2, rebuild the desktop with extensions off following these steps:

Step 1

Hold the Shift key down while starting up the computer.

Step 2

As soon as you see "Welcome to Macintosh Extensions Off", release the Shift key and hold down the Command and Option keys.

Step 3

Continue pressing the Command and Option keys until the dialog asks you if you are sure you want to rebuild the Desktop file.

Step 4

Let go of the keys and click on the OK button.

For System 7.5 and later use the procedure in the previous section which utilizes the extensions manager.

If you have used compression or security utilities, and the preceding solutions do not work, contact the vendors for a solution.

Not Enough Memory to Rebuild

Changing the size of the Finder's partition should not be necessary under System 7, as was sometimes necessary under System 6. The only way to change the size of the Finder's partition under System 7 is either by using ResEdit or by booting under System 6.0.x, and changing the partition there.

The Finder needs to do a little different work under System 7.0 than it did under System 6.0.x. The system is using the Desktop Database, rather than the Resource Manager, which relieves that bottleneck in the system. The Finder can get some additional memory from other places, like the System Heap, if necessary.

There really is no reason that you should need to alter the partition size of the Finder under System 7.

Increasing the Finder's partition sets aside more memory for the Finder and increases the size of your System Heap. In doing this, you set aside the memory for the System Heap but decrease the amount of memory for applications.

If you want to try changing the partition by booting under System 6.0.x, here are the instructions. (Doing this requires you to boot up the Macintosh from a System 6.0.x diskette, and most Macintosh computers introduced after the release of System 7 (including Quadra and PowerBook computers) are not able to use this option.)

Here are the steps for Macintosh computers that can start up under System 6.0.x:

Step 1

Restart your Macintosh from a startup floppy disk that has System 6, like the 800K Disk Tools disk from the Personal Upgrade Kit (not the high-density Disk Tools disk, which contains System 7).

Step 2

Locate and click the Finder file in your System Folder on your Macintosh hard drive (not the Finder on the floppy).

Step 3

Choose Get Info from the File menu and increase the amount of memory allocated to the Finder in the Current size box.

Step 4

Close the Get Info window.

Step 5

Restart your Macintosh (from the hard drive) under System 7 once again.

What to Do If Rebuilding the Desktop Does Not Restore Your Icons
==========

If rebuilding the does not restore your icons, run Disk First Aid to see if there is a problem you can fix. If you have specific files (other than custom icons) that became generic icons, there are these possibilities:

• You may not have the applications that originally created them.

• These files may have lost their bundle bit. MacTools as well as other disk utilities can correct lost bundle bits. Disk First Aid does not detect or repair lost bundle bits.

• The application that created them may simply not assign an icon to them; check with the application's vendor.

• You may be using custom icons, which the Desktop file cannot rebuild. See the article titled "System 7.x: Creating and Using Custom Icon Folders".

TOPIC -----

We get an error when printing with the new version of the StyleWriter driver. We're trying to print on a piece of paper that is 8.5 inches wide and 5.5 inches high. In the page setup dialog we have the orientation set to landscape. We have our margins at 1 inch top and bottom, .5 inch left and 9.5 inches right. When we print from Microsoft Word 5.0, we get an error message that says "The paper is shorter than the size selected in Page Setup. Please add the correct paper, click OK to reprint the page and continue the print job, or Cancel to terminate printing."

With version 1.1 of the StyleWriter driver, we didn't get this message. When we upgraded the drive to 7.2, we started getting this message. Tech Support couldn't reproduce the problem and suggested trying version 7.2.2 of the driver. We get the same results with version 7.2.2. We tried three different StyleWriters on both a Macintosh SE with system 6.0.7 and on a Macintosh Quadra 900 with system 7.0.1.

The Finder has the same problem, but we can't set margins in the Finder. We have the same problem using Excel 3.0, Word 5.0 and 4.0, Freehand 3.1, and PageMaker 4.2 using the Apple driver. We didn't try the Aldus driver because we didn't have a StyleWriter PPD. We get the same results printing in the background and printing straight.

DISCUSSION -----

Appendix B of the StyleWriter Owner's Manual states that the StyleWriter only supports US Letter, US Legal, A4, and #10 envelopes. It doesn't support custom paper sizes.

We contacted the engineer who wrote the StyleWriter Driver. The code has

always been in place to watch for the end of the page, and return an error if end-of-paper occurs before the printer expects it. You were lucky to get functionality using half-size paper.

The obvious workaround is to print twice to a standard-size paper and then cut it in half. Other options would be developing the documents in an application such as PageMaker (or equivalent) that allows you to rotate text objects 180 degrees, printing entirely in one pass of the paper. You would still have to cut the page in half.

Macintosh Quadra 700 Upgrade: Serial Number

==========

Article Created: 8 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

When I upgrade a Macintosh IIcx or Macintosh IIci to a Macintosh Quadra 700, do I get a new serial number? It isn't possible to remove the old serial number tag from the Macintosh IIcx or Macintosh IIci.

DISCUSSION -----

The Macintosh Quadra 700 Logic Board Upgrade (M5950LL/A) doesn't come with, nor does it require a new serial number. You continue to use the serial number from the upgraded Macintosh IIcx or Macintosh IIci. If you want the serial number on the new case, you can etch it on.

Microsoft Mail: Integrating with VMS Mail Systems

==========

Article Created: 7 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

From my Macintosh in Singapore, I want to connect to a VAX system in Europe. I'd like to use the X.25 network system (Telepac). My only application sends and receives electronic mail.

Is there an MS-mail to VMSmail gateway system available? I know that there is an All-in-1 emulation product for the Macintosh to VAX, but I don't have an All-in-1 on my VAX system, only standard VMSmail.

I want to keep cost low and would only want to send and receive mails, not log on to the VAX and create mails across the X.25 line.

DISCUSSION ----------

We found two products, both from Alisa Systems. You can search for them -- and other third-party products -- in the RedGate Macintosh Registry on AppleLink, under Third Parties.

AlisaMail

VAX-based electronic mail system
Macintosh Plus or larger.

AlisaMail is a VAX-based electronic store-and-forward message switch that integrates Macintosh and VAX mail systems. It's an expanding series of mail servers and an SQL-based engine, called the Information Switch, that when used together provides transparent message exchange between users of Microsoft Mail, VMSmail, All-In-1, X.400 and more. AlisaMail consists of a VAX-based server for Microsoft Mail (100 percent Microsoft Mail compatible), a VMSmail server and the Information Switch. Servers for

Automatic Document Conversion and for Digital's Message Router will be available. The Information Switch provides message and directory services for the AlisaMail servers and comprehensive administration facilities, including accounting and reporting for tracking delivery delays and message traffic loads and other similar functions. Available with 10-user license or unlimited user license.

MailMate

Macintosh to VAX mail bridge
Macintosh Plus or larger.

The MailMate family of products provide gateways to DECnet mail users for existing Macintosh-based electronic mail packages. Currently, MailMate gateways are available for CE Software's QuickMail and Microsoft Corp.'s Microsoft Mail. The MailMate gateways provide two-way exchange of text messages with Digital Equipment Corp.'s DECnet mail (also known as VMSmail), making mail exchange possible between QuickMail or Microsoft Mail and Digital's All-In-1 system, IBM PROFS, X.400 and other services supported by MailBus, when used in conjunction with Digital's Message Router/MailBus services and the MRGATE gateway. MailMate products support use of automatic address prefix and suffix for groups of users, restricting access to gateway services, logging of all gateway activity for the mail manager, use of pre-defined forms and templates for users and one-off addressing. MailMate licenses are available for one to 10 users, one to 30 users, one to 100 users and unlimited users. MailMate uses Alisa's DECnet package for the Macintosh, making the Macintosh a true DECnet node capable of receiving and sending DECnet mail. DECnet access may be via Ethernet, LocalTalk (and the Kinetics FastPath IV) or asynchronous (DDCMP) connection.

TOPIC ----------

This article describes the Apple IIe computer.

DISCUSSION ----------

The Apple IIe personal computer comes with platinum finish to match existing platinum Apple II peripherals.

Features

- A built-in numeric keypad

- 128K of random access memory and 16K of read-only memory, including Applesoft BASIC

- A 65C02 microprocessor

- Multipurpose memory-expansion and video slot and seven additional I/O expansion slots

- Typewriter-style keyboard, with 128 ASCII codes

- Special-purpose keys, including two programmable keys

- High-fidelity speaker

- Multipurpose hand control inputs and outputs, and cassette input and output.

The Extended 80-Column Text Card is installed in the Apple IIe's aux/video

slot.

Apple IIGS: Description (Discontinued)

==========

Article Created: 8 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Apple IIGS computer.

DISCUSSION ----------

The Apple IIGS personal computer is the most powerful member of the Apple II family.

Features

- 256K of built-in RAM and 256K of additional RAM via the Apple IIGS Memory Expansion Card, which is included. The RAM is expandable to 8MB.

- A 16-bit 65C816 processor lets the Apple IIGS run more sophisticated applications, including those with Macintosh-style interface, as well as most existing Apple IIe and IIc software. With a clock speed of 2.8 instead of 1 megahertz, these programs will run up to 2.8 times faster on the IIGS.

- 128K of ROM memory expandable via the memory expansion slot up to one megabyte.

- Control Panel, which enables users to set screen colors and speaker volume.

- Detachable keyboard with 14-key numeric pad. It contains two Apple Desktop Bus ports on opposite ends; one is for connecting the keyboard to the computer, and the second is for the mouse or other ADB-compatible input devices.

- Eight international character sets can be displayed.

- Two built-in serial ports allow for easy connection of AppleTalk, a modem, printer, or other serial devices.

- Seven general purpose expansion slots are available for peripherals, in addition to a dedicated RAM/ROM slot.

- Up to 15 separate audio voices can be generated simultaneously for music, speech, and sound effects.

- Analog RGB port allows for quick connection to the AppleColor RGB Monitor; no adaptors or additional interface are required.

Benefits

- Compatibility with most Apple peripherals.

- The eight expansion slots give the Apple IIGS a virtually unlimited growth path. One slot is dedicated to RAM/ROM cards, while the other seven are general-purpose peripheral-interface slots.

- The disk-drive port lets users take advantage of the 800K Apple 3.5 Drive and 143K 5.25 Drive. They can be used individually, in any combination, or with UniDisk 3.5 drives. Up to four drives can be daisy-chained from the drive port. With the addition of the Apple II SCSI Card and cable, the Apple IIGS can work with the 20MB Apple Hard Disk 20SC.

- With the AppleColor RGB Monitor, the Apple IIGS produces crisp 80-column color text; a palette of 4096 colors, with as many as 256 on screen at once, is available.

- The Apple Desktop Bus (ADB) standard allows for easy connection of multiple input devices such as a graphics table and mouse. Users can connect another ADB peripheral to the keyboard, then daisy-chain more accessories from it. Up to sixteen devices can be connected at one time.

- Access to the AppleTalk Personal Network is possible, without an interface card, via the Apple IIGS's built-in serial ports.

- New applications that use windows, pull-down menus, and other Macintosh features can be used.

- A choice of QWERTY (Sholes), Dvorak, and international keyboard layouts.

Macintosh Classic: Description (Discontinued)

==========

Article Created: 8 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Macintosh Classic computer.

DISCUSSION ----------

The Apple Macintosh Classic personal computer performs up to 25% faster than the Macintosh Plus, and comes standard with the Apple SuperDrive. The SuperDrive is a 3.5-inch disk drive that can read from and write to Macintosh disks as well as MS-DOS, OS/2, and ProDOS disks. AppleTalk networking and sound output capabilities are built-in. A SCSI port allows connection of up to seven peripheral products. An internal hard disk drive is optional.

Features

- 68000 microprocessor, running at 7.8336 megahertz

- Apple SuperDrive (1.4-megabyte floppy disk drive)

- Six built-in ports: One SCSI port, one Apple Desktop Bus (ADB) port, one external 3.5-inch disk interface, two serial ports, and one sound port

- Optional 40MB internal hard disk drive

- 1 or 2MB of RAM, expandable to 4MB

- 512K of ROM, including HFS (Hierarchical File System), drivers for Macintosh hard disks, ADB, SCSI, and an AppleTalk network, Macintosh Toolbox, and QuickDraw

- Macintosh user interface, including mouse, icons, windows, and pull-down menus

- MultiFinder operating system

- Software Compatibility

Benefits

- Offers up to 25 percent faster performance and system responsiveness than the Macintosh Plus system.

- SuperDrive allows convenient transfer of data files between Macintosh, OS/2, MS-DOS, and Apple II systems, and provides almost twice the storage capacity of 800K disk drives.

- It's easy to expand your system with additional peripheral devices.

- Accommodates a second 800K or 1.4MB external 3.5-inch disk drive.

- Provides access to LocalTalk cable-based networks, which allow you to connect Macintosh Classic systems to other computers and to LaserWriter printers through the AppleTalk network system.

- Supplies high-quality, four-voice digital sound that is compatible with all applications that use Macintosh sound.

- Handles a broad range of computing needs by providing ample storage capacity for files and applications.

- Provides a simple growth path as you need additional memory.

- Lets you work with large amounts of data, such as large spreadsheets, scanned images, and sound files.

- Supports Macintosh System 7.

- Hierarchical File System organizes document storage and allows easy access to files.

- SCSI interface supports high-performance peripherals.

- QuickDraw provides a consistent graphics interface for applications, making applications intuitive and easy to learn, and reducing training and support costs.

- Lets you easily cut and paste parts of documents from one application to another.

- Allows background tasks to be run while you interact with applications in the foreground.

- Lets you run virtually all Macintosh software.

PowerBook HDI-20 External 1.4MB Drive: Specifications (3/94)

Revised: 3/5/94
Security: Everyone

PowerBook HDI-20 External 1.4MB Drive: Specifications (3/94)

==========

Article Created: 8 May 1992
Article Reviewed/Updated: 4 March 1994

TOPIC ----------

This article gives technical specifications for the PowerBook HDI-20 External 1.4MB drive.

DISCUSSION ----------

Recording Media
- Disk diameter: 3.5 inches (9.0 cm)
- Recording surfaces: 2
- Tracks per inch: 135 (5.31 tracks per millimeter)

Capacity
- Formatted data capacity: 1.4MB (MFM), 800K (GCR), 720K (MFM)
- Unformatted data capacity: 1MB or 2MB

Drive Characteristics
- Seek time (track to track): 3 milliseconds
- Settle time: 18 milliseconds
- Drive startup time: 800 milliseconds maximum

Interfaces
- Connects directly to the Macintosh PowerBook 100 or the PowerBook Duo (needs PowerBook Duo Floppy Adapter) via the HDI-20 floppy disk drive port.

Environmental Requirements
- Operating temperature: 50 F to 122 F (10 C to 50 C)
- Storage temperature: -40 F to 140 F (-40 C to 60 C) noncondensing
- Relative humidity: 5% to 90% (with a maximum wet bulb temperature of 82 degrees F or 29 degrees C)

Weight
- 1 pound, 6 ounces

Dimensions
- 7 inches long x 4.5 inches wide x 1 inch high

Article Change History
4 March 1994 - Updated to reflect actual weight of drive.
2 December 1992 - Updated to add weight and dimension information, and to include support for the PowerBook Duo.

Macintosh IIsi: Description (Discontinued)

==========

Article Created: 8 May 1992

Article Change History

02/03/93 - REVIEWED
- For technical accuracy.

TOPIC ----------

This article describes the Macintosh IIsi computer.

DISCUSSION ----------

The Macintosh IIsi is equipped with a 20-megahertz 68030 microprocessor that runs Macintosh applications up to five times faster than the Macintosh Classic. The Macintosh IIsi supports A/UX.

The Macintosh IIsi comes with built-in support for four Apple monitors as well as third-party monitors. A video expansion card can be added if you need to use any other Apple or third-party monitors.

An internal expansion slot for either a NuBus card or an 030 Direct Slot card allows you to add one of the expansion cards that are available for communications, video, or coprocessing. An optional floating-point math coprocessor can be added to speed mathematical calculations. Eight external ports allow you to connect peripheral equipment.

Sound input is available with the Macintosh IIsi. The unit comes with a microphone and phono jack adapter, which let you input your voice into documents, presentations, and even electronic mail messages.

The Macintosh IIsi will run applications supported by System software version 7.0.

Features

- 68030 microprocessor, running at 20 megahertz; built-in Memory Management Unit (MMU)

- Optional 68882 floating-point math coprocessor, running at 20 megahertz

- Multiple monitor options including:
  - Built-in video support for four Apple monitors:
    - Macintosh 12-inch RGB Display
    - AppleColor High-Resolution RGB Monitor
    - Macintosh 12-inch Monochrome Display
    - Apple Macintosh Portrait Display

  - Support for other Apple or third-party monitors that require a video expansion card

- One internal expansion slot for either a NuBus card or an 030 Direct Slot card

- Sound input

- Apple SuperDrive (1.4MB floppy disk drive)

- 40- or 80MB internal hard disk drive

- Eight Built-in Ports
  one SCSI port, one Apple Desktop Bus (ADB) port, external disk drive port, two serial ports, one sound-in port, one sound-out port, one video port

- 1MB of on-board RAM, expandable to 17MB

- 512K of ROM, including support for: 32-bit addressing, Hierarchical File System, 32-Bit QuickDraw, sound input

- Choice of keyboards (sold separately): Apple Keyboard, Apple Extended Keyboard

- Macintosh user interface, including mouse, icons, windows, and pull-down menus

- Software compatibility

Benefits

- Runs applications up to five times faster than the Macintosh Classic.

- Supports A/UX, Apple's implementation of the AT&T operating system.

- Supports virtual memory.

- Provides fast processing of mathematical calculations.

- Eliminates the need for a separate video card or special driver software.

- Lets you work with up to 256 colors or shades of gray simultaneously on the Macintosh 12-inch RGB Display and the AppleColor High-Resolution RGB Monitor, up to 256 shades of gray with the Macintosh 12-inch Monochrome Display, and up to 16 shades of gray with the Apple Macintosh Portrait Display.

- Lets you work with the monitor that best suits your needs -- including monitors that produce photographic-quality color.

- Lets you incorporate new capabilities or increase system performance by adding an expansion card for communications, graphics, emulation.

- Lets you add one of the NuBus cards that are available for all other Macintosh II systems.

- Lets you add one of the 030 Direct Slot cards that are available for the Macintosh SE/30 personal computer.

- Allows convenient transfer of data files between Macintosh, OS/2, MS-DOS, and Apple II systems.

- Provides almost twice the storage capacity of 800K disk drives.

- Provides ample storage capacity for files and applications.

- Supports up to seven peripherals such as CD-ROM drives, scanners, and printers.

- Supports either an external 800K or 1.4MB Apple SuperDrive floppy disk drive.

- Provides access to LocalTalk cable-based networks, which allow you to connect Macintosh IIsi systems to other computers and to LaserWriter printers through the AppleTalk network system.

- Supports sound input via microphone or phono jack adapter.

- Supplies four-voice digital sound output that is compatible with all applications that use Macintosh sound.

- Provides connection to all monitors supported by the Macintosh IIsi computer's built-in monitor support.

- Lets you work with large amounts of data, such as large spreadsheets, scanned images, and sound files.

- Enables future 32-bit versions of the Macintosh Operating System to address up to 4 gigabytes of memory.

- Enables color systems to display up to 16 million colors simultaneously.

- Apple Keyboard includes a numeric keypad and cursor keys.

- Apple Extended Keyboard also includes 15 function keys, letting you work effectively with alternate operating systems, terminal-emulation programs, and other data communications applications.

- Makes most applications intuitive and easy to learn.

- Reduces training and support costs.

- Provides a consistent user interface across applications.

- Allows multiple applications to be opened concurrently.

- Lets you easily cut and paste parts of documents from one application to another.

- Allows background tasks to be run while you interact with applications in the foreground.

Macintosh LC: Description (Discontinued)

Revised: 6/2/94
Security: Everyone

Macintosh LC: Description (Discontinued)

==========

Article Created: 8 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Macintosh LC computer.

DISCUSSION ----------

The Apple Macintosh LC personal computer is, at its introduction, the lowest-cost color-capable Macintosh. The 16-megahertz 68020 microprocessor increases system responsiveness more than 100 percent over the Macintosh SE and Classic.

Built-in support for three Apple monitors eliminates the need to add a separate video card. The three monitors that may be used with the Macintosh LC are the Macintosh 12-inch RGB Display, the Macintosh 12-inch Monochrome Display, and the AppleColor High-Resolution RGB Monitor. You can use 256 colors on the Macintosh 12-inch RGB Display, 16 shades of gray on the Macintosh 12-inch Monochrome Display, and 16 colors on the AppleColor High-Resolution RGB Monitor. The optional Macintosh LC 512K VRAM (video random- access memory) SIMM (Single In-line Memory Module) allows the generation of more colors or shades of gray on all three monitors.

The Macintosh LC has been designed so you can add sounds to documents created with the computer.

The system comes standard with the 1.4MB Apple SuperDrive disk drive. This allows read/write operations to 3.5-inch disks initialized for the Macintosh as well as MS-DOS, OS/2, and ProDOS. A 40MB internal hard disk is also included.

There are seven built-in ports to connect the Macintosh LC with peripheral

equipment. Built-in networking is also included. A processor-direct slot allow you to add a high-performance expansion card for additional graphics and communications.

The available Apple IIe Card is allows the Macintosh LC to run all applications developed for Apple IIe systems. The Macintosh LC supports System software 7.0.

Features

- 68020 microprocessor, running at 16 megahertz

- Built-in Video Support for Three Apple Monitors
  Macintosh 12-inch RGB Display, Macintosh 12-inch Monochrome Display, and AppleColor High-Resolution RGB Monitor

- Optional Macintosh LC 512K VRAM SIMM

- Sound input

- Apple SuperDrive (1.4MB floppy disk drive)

- Apple IIe Card

- 020 Direct Slot

- Seven Built-in Ports
  one SCSI port, one Apple Desktop Bus (ADB) port, two serial ports, one sound-in port, one sound-out port, and one video output port

- 40MB internal hard disk drive

- 2MB on-board RAM, expandable to 10MB

- Macintosh user interface, including mouse, icons, windows, and pull-down menus

- Software compatibility

Benefits

- More than 100 percent faster performance and system responsiveness than Macintosh SE and Macintosh Classic systems

- Choice of Apple displays, both color and monochrome

- 256 colors available simultaneously on the Macintosh 12-inch RGB Display, up to 16 shades of gray on the Macintosh 12-inch Monochrome Display, and up to 16 colors on the AppleColor High-Resolution RGB Monitor

- Allows display change without adding video card

- Color depth can be increased to 256 colors or shades of gray on the AppleColor High-Resolution RGB Monitor and Macintosh 12-inch Monochrome Display.

- 32,000 colors on the Macintosh 12-inch RGB Display

- Allows you to add voice comments to voice-capable word processing, spreadsheet, and other documents; send spoken electronic mail messages; add voice excerpts to presentations; and create spoken password protection for sensitive files.

- Allows convenient transfer of data files between Macintosh, OS/2, MS-DOS, and Apple II Systems.

- Twice the storage capacity of 800K disk drives

- Allows you to run all applications that have been developed for Apple IIe computers. Preserves your investment in Apple IIe software.

- High-performance expansion card for communication, emulation, and graphics.

- Supports up to seven popular peripherals such as CD-ROM drives, scanners, and printers.

- Easy external access to optional expansion cards

- Access to LocalTalk cable-based networks; connection to other computers and to LaserWriter printers through the AppleTalk network system

- Sound input via microphone or phono jack adapter

- High-quality sound output that is compatible with all applications that use Macintosh sound.

- Connection to external video display devices

- Simple growth path as you need additional memory.

- Lets you work with large amounts of data, such as spreadsheets, scanned images, and sound files.

- Makes most applications intuitive and easy to learn.

- Reduces training and support costs.

- Provides a consistent user interface across applications.

- Allows multiple applications to be opened concurrently.

- Lets you easily cut and paste parts of documents from one application to another.

- Allows background tasks to be run while you interact with applications in the foreground.

- Runs all Macintosh software.

Macintosh II: Description (Discontinued)

Revised: 6/2/94
Security: Everyone

Macintosh II: Description (Discontinued)

==========

Article Created: 8 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Macintosh II computer.

DISCUSSION ----------

As a member of the Apple Macintosh family of computers, the Macintosh II runs the same software and has the same icon/mouse interface as previous versions of the Apple Macintosh.

The Macintosh II uses a Motorola 16 MHz 68020 microprocessor, which has a 32-bit data bus. These factors have the potential to speed up Macintosh Plus software (which runs on an 8 MHz 68000) by a factor of 4. Other properties of the 68020 add to that speed advantage, and with the standard 68881 floating-point coprocessor, certain Macintosh software may run as much as 200 times faster on the Macintosh II than on a Macintosh Plus.

ROM in the Macintosh II has been completely rewritten, and includes Color QuickDraw, which supports the definition of over 16 million colors. With the Macintosh II Video Card and its Expansion Kit the Macintosh II can display 256 colors (or shades of gray) on the screen at once. Since the Macintosh II has flexible video options, you may choose a video device that best suits your needs.

Six NuBus slots provide a flexible means of expanding the architecture. NuBus, Texas Instruments' synchronous bus definition, allows any device to become master of the system. Therefore, 80286 cards, EtherNet cards, and other intelligent interfaces may, at times, gain control of the CPU. With this architecture, the Macintosh II may conceivably run MS-DOS software, act as a smart terminal, or drive a variety of output devices.

The Macintosh II supports 4-voice hardware sound. The firmware now contains synthesizers for MIDI, note, wave table, and sampled sound production; and it supports the addition of other sound hardware through the NuBus slots or through the external sound jack.

Macintosh Plus: Description (Discontinued)

==========

Article Created: 8 May 1992
Article Reviewed/Updated: 27 July 1992

TOPIC ----------

This article describes the Macintosh Plus computer and the improvements over the original Macintosh 128K and 512K computers. It also describes the Macintosh Plus Upgrade Kits for those computers.

DISCUSSION ----------

FEATURES

- One Full Megabyte of Memory
  With one full megabyte of RAM available (expandable to four megabytes), the Macintosh Plus can accommodate memory-intensive application programs. Large models, documents, and databases are easily handled.

- 800K of Storage Capacity
  The 800K drive stores more system programs and applications on a dual-sided 3.5 disk and still leaves space for data files. The 800K drive operates at twice the speed of the 400K drive.

- A High Speed Peripheral Port
  Equipped with a Small Computer Systems Interface (SCSI) port, the Macintosh Plus transfers data up to six times faster through the SCSI port than through the disk drive port. Up to seven peripherals can be daisy chained to the Macintosh Plus at one time.

- Enhanced ROMs
  A new 128K ROM has been added to the Macintosh Plus. It offers a Hierarchical File System which allows the Macintosh Plus to operate faster and function more efficiently, improving overall system performance. It provides the user with a more efficient way to store and retrieve documents.

- Cursor Keys and a Numeric Keypad

The Macintosh Plus features a keyboard with cursor keys and a numeric keypad designed to accelerate data entry.

Connecting the Macintosh Plus to Apple peripherals and third party peripherals requires certain cables.

To ensure that users get the best performance from their Macintosh Plus, they must install the Macintosh Plus system software on all their application disks. A program called the "Installer" on the Macintosh Plus System Tools disk makes installation quick and easy. This diskette is bundled with every Macintosh Plus and Macintosh Plus Disk Drive Kit. Additional information about the Installer is included in the Macintosh Plus Owner's Guide, as well as the 800K External Disk Drive Manual.

Upgrade Kits

Three Macintosh Plus Upgrade Kits enable customers to upgrade from a Macintosh 128K or a 512K to a Macintosh Plus.

The kits are:

- The Macintosh Plus Disk Drive Kit
  This kit includes an 800K Disk Drive, 128K ROM, and Macintosh Plus Systems Tools Disk to update existing applications to work on the Macintosh Plus. This kit exchanges the ROM chip and disk drive in the Macintosh 128K or 512K for the new 800K Disk Drive and 128K ROM.

- The Macintosh Plus Logic Board Kit
  This kit includes the Macintosh Plus logic board with 1MB of RAM and new rear housing to accommodate the external SCSI port, and a Macintosh Plus Owner's Guide and information sheet. Also included is a Macintosh Plus Peripheral Adapter which allows connection to Macintosh peripherals such as ImageWriter and popular third-party peripherals. A Macintosh Plus Disk Drive is required in order to install the Macintosh Plus Logic Board Kit.

- The Macintosh Plus Keyboard Kit
  This kit includes a keyboard with standard alpha layout, cursor keys, and a numeric keypad for easy data entry. It requires no dealer installation.

NOTE

The Macintosh Plus Upgrade Kits are no longer in production. Please check with your authorized Apple dealer for availability.

Article Created: 8 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Macintosh Portable computer.

DISCUSSION ----------

The Macintosh Portable provides complete Macintosh functionality in a portable design. Everything -- CPU, screen, keyboard, trackball, battery, and disk storage -- is integrated into a single, easy-to-carry package.

Active Matrix Display

The Macintosh Portable has a high-contrast Active Matrix Liquid Crystal Display (AMLCD) with a fast response rate; it displays the full width of a page, and makes the screen easy to see in almost any lighting condition, from almost any angle.

Expansion Slots

The Macintosh Portable's four internal expansion connectors allow you to customize it for your specific needs:

- Internal Modem Slot
  This allows installation of the Macintosh Portable Data Modem 2400, an internal asynchronous modem that can exchange information with any other standard data modem at 300, 1200, and 2400 bits per second. The modem was specifically designed for the Macintosh Portable to minimize power usage and thus extend the battery life. It will even wake up the Macintosh Portable when it receives an incoming phone call.

- Processor Direct Expansion Slot

You can install additional third-party RAM, up to the system's full capacity of 9MB, or various third-party communications cards supporting protocols such as Ethernet.

- ROM Slot
  This allows easy upgrading of system ROM, or the addition of third-party ROM enhancements.

- RAM Slot
  You can upgrade internal memory to 4MB.

Full Power

Most battery-powered computers run for only two to three hours before needing to be recharged; the Macintosh Portable provides from 6 to 12 hours of operation, depending on system configuration and usage. To conserve power and extend battery life, the Portable includes a special microprocessor that manages power use and posts warnings when the battery is getting low. A Battery desk accessory monitors power levels and displays a meter to show how much power remains.

Features

- All-in-One Design
  Built-in CPU, display, trackball, disk drive, and standard Macintosh keyboard. Easy to pack, carry, set up, and use almost anywhere, anytime.

- 68000 CMOS Processor Operating at 16 MHz
  CMOS (Complimentary Metal Oxide Silicon) microprocessors require very little power, helping to extend battery life. The 16MHz clock speed of the 68000 runs at twice the speed of the Macintosh SE, providing rapid processing for spreadsheets, databases, and other applications.

- Power Management Microprocessor
  This chip conserves power by monitoring system components and putting them into a standby "rest" or "sleep" mode when not in use, while retaining memory contents.

- Replaceable Lead Acid Battery
  The lead acid battery allows the computer to monitor voltage levels and provide information on remaining power. It also lets you recharge at any time without requiring a deep discharge cycle, and can be easily replaced if necessary.

- Apple 1.4MB SuperDrive
  The high-density floppy disk drive lets you work in multivendor environments where access to data from other computers is important. SuperDrive allows you to format, read, and write to Apple 400K, 800K and 1.4MB floppy disks, as well as ProDOS, MS-DOS, and OS/2 720K and 1.44MB floppy disks.

- Interchangeable Low-Power Keyboard, Trackball

The trackball can be replaced with an optional numeric keypad for number-intensive applications, and either device can be mounted on either side of the keyboard for right- or left-handed use.

- Power Adapter for 85 to 270 Volts AC, 48 to 62 Hz
  The adapter makes the Portable easy to use in almost any country, without transformers (requires only a simple plug adapter).

- Optional 40MB Internal Hard Disk
  The low power hard disk's 28 millisecond access time provides fast and easy access to files and applications. The 40MB hard disk configuration of the Macintosh Portable (M5351) comes from the factory with System 6.0.4 and HyperCard 1.2.3 installed.

- Eight Built-In Ports
  External disk drive, SCSI, Apple Desktop Bus, printer, modem, audio, power adapter, and video ports. The ports provide easy access to all standard Macintosh peripherals. With the addition of an optional Video Adapter (available later in 1989), the Portable can also drive external monitors and projection systems, allowing presentations to large audiences.

- Apple Stereo Sound Chip
  Enables the portable to provide high-quality stereo sound, and to be compatible with all applications using Macintosh sound.

- High Quality Foam-Lined Carrying Case
  This case (included with the Portable) provides easy portability, as well as internal pockets for items such as power adapter, numeric keypad, extra battery, disks, and papers.

System Software

The Macintosh Portable requires System Software version 6.0.4 and HyperCard version 1.2.5.

Macintosh SE: Description (Discontinued)

Revised: 5/18/94
Security: Everyone

Macintosh SE: Description (Discontinued)

==========

Article Created: 8 May 1992
Article Reviewed/Updated: 18 May 1994

TOPIC ----------

This article describes the Macintosh SE computer which was discontinued by Apple in October 1990.

DISCUSSION ----------

The Macintosh SE adds expansion and flexibility to the power of the Macintosh Plus.

Processing speed is improved 15 to 20 percent over previous models, allowing faster recalculations of spreadsheets and faster document processing. SCSI performance is up to two times faster than on the Macintosh Plus.

The Macintosh SE comes standard with either two 800K internal drives, or one 800K internal drive and one internal 20MB SCSI hard disk.

The Macintosh SE incorporates the features of the Macintosh Plus including:

- The same compact design
- A 68000 microprocessor
- One megabyte of memory (expandable to four megabytes)
- A connection for SCSI peripherals
- The Macintosh SE-Bus Expansion Slot allows for the addition of a variety of cards:
  - Accelerator cards
  - External monitor adapters
  - Coprocessor cards
  - Networking and communication cards
  - A 5.25-inch MS-DOS disk drive controller card
- Seven built-in ports, including:
  - One SCSI port
  - One drive port

  - Two RS422 serial ports
  - One sound port
  - Two Apple Desktop Bus (ADB) ports
- One megabyte of RAM, expandable up to four megabytes.
- 256K ROM, which includes support for:
  - Internal and external SCSI connectors
  - Internal drives
  - One expansion slot
  - Apple Hard Disk 20SC
  - The Hierarchical File System
  - QuickDraw
  - AppleTalk
  - The Apple Desktop Bus

A keyboard isn't included with either configuration of the Macintosh SE. However, two keyboards -- the Apple Keyboard and Apple Extended Keyboard -- are available.

Macintosh Quadra: Selecting NTSC Convolution

Revised: 7/21/92
Security: Everyone

Macintosh Quadra: Selecting NTSC Convolution

==========

Article Created: 7 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm doing video out on the Macintosh Quadra 700 using a RasterOps Video Expander. I've installed a VRAM upgrade (two SIMMs) bringing the total VRAM to 1MB.

According to Apple documentation, this VRAM configuration should support convolution. RasterOps indicates that it does, and that you should be able to choose convolution from the Monitors control panel. Nowhere do the words "Convolution" or "Interlaced" appear in the main Monitors control panel window or the Options… dialog.

I see "flicker" on the NTSC monitor, when there should be none.

DISCUSSION ----------

The Quadra Built-in Video Options… dialog of the Monitors control panel is not offering the four "Select monitor type:" options that it should:

- 512 x 384 NTSC
- 640 x 480 NTSC
- 512 x 384 NTSC Convolved
- 640 x 384 NTSC Convolved

This indicates that the built-in video doesn't understand that the NTSC mode is being requested. The configuration of the sense pin connections indicates the request for this mode.

For the built-in video to understand a request for NTSC mode, "sense0" (pin 4) and "sense1" (pin 7) need to be grounded to pin 11, the composite and vertical sync ground.

```
  4      MON.ID1  (sense0) --|
  7      MON.ID2  (sense1) --|
  11     C&VSYNC.GND --------|
```

With these pins grounded, all of the tests we did put the Quadras into the NTSC mode, defaulting to "512 x 384 Convolved." However, by opening the Options… dialog in the Monitors control panel, we could select any of the other three monitor types.

After changing the monitor type, you need to restart the Quadra for the change to take effect.

Macintosh Quadra 950: CD and Sound

==========

Article Created: 18 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

One of the internal storage devices in the Macintosh Quadra 950 computer can be a CD-ROM drive, installed at the front for media access.

DISCUSSION ----------

The CD-ROM drive connects to the internal SCSI bus, and an additional cable takes the audio signals from the CD-ROM to the main circuit board. Therefore audio CDs can be heard through the system speaker. When speakers are connected to the external sound-out on the computer, CD, system beep, and other system sounds will be heard through the speakers as well. This integration of the audio signals into the computer provides three functions that are important for multimedia applications:

- Ability to play audio from the CD-ROM through the internal sound system

- Ability to mix audio from the CD-ROM with computer-generated sound

- Ability to perform digital recording of audio from the CD-ROM

Volume control for an internal AppleCD SC Plus is done through software. The CD Remote DA detects that the CD-ROM drive is internal, and provides volume control. On external drives, the software control isn't visible, and the hardware control is used.

As in the Quadra 900, the AppleCD SC Plus won't be sold as an optional configuration, but the logic still exists, and will work in the Quadra 950.

Note: The existing sound input is 8-bit linear PCM with analog limiting to enhance the power of the signal being digitized. The sample rate may be

set for 22 kHz or 11 kHz. Therefore the results won't be significantly better than a low-cost cassette recorder without noise reduction. This level of performance is adequate for voice annotation, but won't produce the best results with music.

To compensate for some of the shortcomings of the sound input system, the gains for the line input and internal CD input are somewhat higher than normal. This may cause overdrive distortion on loud material, but will boost the signal to mask a lot of digitizing noise on soft material. The user can turn down the input to the digitizer, either by backing off the volume slider on the internal CD control panel or by reducing the volume of the signal driven to the line input jacks. The main point is, some experimentation may be required for best results.

The internal CD drive stereo analog outputs are developed from a source sampled at the CD 44 kHz sample rate. The sound input system samples at 22 kHz or 11 kHz. The sound input system filters the CD signal (and line OR microphone, for that matter) to prevent bothersome aliasing. Therefore, most of the high-end sound is lost. For 22 kHz sampling, the sound is filtered at around 8 kHz, and at 11 kHz the sound is filtered at around 4 kHz. The former may be thought of as "AM radio" quality, the latter as "telephone" quality.

Macintosh Quadra 950: Internal Mass-Storage Devices

Revised: 5/15/92
Security: Everyone

Macintosh Quadra 950: Internal Mass-Storage Devices

==========

Article Created: 18 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the internal mass-storage options in the Macintosh Quadra 950.

DISCUSSION ----------

The floor-standing case provides flexibility for internal mass-storage devices. There are four half-high mounting locations. Two of the four are in the front of the case, accessible for removable media. Any of the four locations can accommodate either a 3.5-inch or a 5.25-inch hard disk drive. The 1.44MB SuperDrive disk drive doesn't take up one SCSI slot, therefore there are four additional SCSI connections possible.

A hard disk drive for the Quadra 950 computer can be a 3.5-inch or 5.25-inch half-height device or a 5.25-inch full-height device. The Quadra 950 comes with either a 230MB or 400MB hard drive. Third party full-height drives are available with even higher capacities. Third parties will have to ship their internal devices with a carrier. Users must keep track of the SCSI IDs of their internal devices, use Get Info on each drive to check the IDs, or use a public domain package such as SCSI Probe to make sure there is no conflict on the SCSI bus. A note on this has been added to the User's Guide.

The upper-front location will always be filled with a 1.44MB SuperDrive. The lower front location can accommodate a backup device, either tape or magneto-optical, or a non-removable SCSI device. One of the internal storage devices in the Quadra 950 computer can be a CD-ROM drive, installed at the front for media access.

Quadra 900, 950, AWS 95, WS 9150: Security Keyswitch (2/95)

Revised: 2/22/95
Security: Everyone

Quadra 900, 950, AWS 95, WS 9150: Security Keyswitch (2/95)

==========

Article Created: 18 May 1992
Article Reviewed/Updated: 22 February 1995

TOPIC ----------

The Quadra 900, 950, Workgroup Server 95, and Workgroup Server 9150 come with a security keyswitch that allows owners to limit access to the computer.

DISCUSSION ----------

The keyswitch has three positions: OFF, ON, and SECURE. The key can be removed while the switch is in any of the three positions. The operation of the keyswitch is designed to provide a first level of security for users who wish to use it, without being inconvenient for those who don't.

Keyswitch OFF Position

When the keyswitch is in the OFF position, the computer can't be turned on. Moving the keyswitch from either the ON or SECURE position to the OFF position turns the computer off.

CAUTION: Turning the keyswitch to OFF when the computer is running turns the power off immediately -- the system software doesn't have a chance to close files. If the computer is turned off by turning the keyswitch to OFF, data can be lost.

Keyswitch ON Position

When the keyswitch is in the ON position, the user controls the power the same way as on any other computer in the Macintosh II, Quadra, and Power Macintosh family. The computer can be turned on from the keyboard and turned off with the Shut Down menu item.

Keyswitch SECURE Position

When the keyswitch is in the SECURE position, the ADB devices and floppy disk

are disabled. For example, the keyboard does not generate characters, or the mouse moves but no menus can be pulled down. Also when power is applied to the computer while the keyswitch is in the SECURE position, the computer automatically starts up. The SECURE position is intended for situations involving remote access, or in which the computer is a network server. In the SECURE position, the computer will automatically power on if power is disrupted (that is, if the cable is removed, or power goes out).

Lost Keys

Naturally, the best thing to do is to make several copies of the key immediately and place them in a secure location. Most key shops have blanks for the type of key used in the 900/950/AWS95/WS9150.

But if the key is already lost, a customer can take the machine to a locksmith shop and have them create a new key to unlock the system. If this option is not viable, a customer can order an entire replacement lock assembly from any Apple service provider. The part number is 705-0175.

For security reasons Apple will not replace individual keys.

If the key is missing out of the box of a new Macintosh, customers should contact the Apple Customer Assistance Center (800-776-2333). A replacement lock assembly will be sent to the customer's authorized Apple service provider, who can install it.

Article Change History:
22 Feb 1995 - Added clarification on key in secure position.
10 Oct 1994 - Clarified Discussion and part number for key.
29 Mar 1993 - Revised to add references to all Quadra 9x0 series computers.

Macintosh Quadra 950: Power Supply

==========

Article Created: 18 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

This article describes the Macintosh Quadra 950 power supply.

DISCUSSION -----

The power supply on the Macintosh Quadra 950 is a 300 watt power supply, and adapts automatically to the AC voltage that is applied. The localization package for the computer includes the appropriate power cord for the destination country.

The power supply includes a 120 mm (4.72-inch) fan that provides quiet cooling for the entire system. The power supply also includes a switched convenience receptacle to provide power for the monitor.

Power Supply Ratings

Load	+5V	+5V TRKL	+12V	–12V	Total Power
Minimum	5 A	1 mA	150 mA	50 mA	27.5 W
Maximum	33 A	125 mA	10 A	1 A	303.25 W
Peak	33 A	125 mA	20 A*	1 A	424 W*

*For a period of 12 seconds maximum

The table shows the minimum, maximum, and peak ratings for the power supply. The output labeled +5V TRKL is a trickle supply that is available whenever the computer is plugged in. That output provides power for the parameter RAM and the power-on logic, along with standby power for the NuBus cards. The +12V output is designed with a peak capacity high enough to meet the combined current demands made by all the peripheral devices

turning on at the same time.

Macintosh Quadra 950: Description

Revised: 5/15/92
Security: Everyone

Macintosh Quadra 950: Description

==========

Article Created: 18 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Macintosh Quadra 950.

DISCUSSION ----------

The Macintosh Quadra 950, which replaces the Quadra 900, features 33 MHz, improved video, and improved I/O. An upgrade will be offered for existing Quadra 900 owners.

The key features of The Quadra 950 are:

- Motorola 68040, 33 MHz
- 8MB to 64MB DRAM using 4MB SIMMs
- Supports 24 bpp up to a 16-inch monitor, 16 bpp on all displays (New CLUT/DAC)
- Improved I/O with a clock frequency of 25 MHz (Quadra 900 is 16 MHz)
- Up to four internal SCSI devices
- Five NuBus slots with support for higher-powered cards
- Floor-standing design
- System Software 7.0.1 and Tune-Up disk (no changes in system software)
- System configurations of 230MB and 400MB available at introduction (no 160MB configuration)

Form Factor

The Macintosh Quadra 950 computer has the same form factor as the Quadra 900, and support up to four internal SCSI devices.

The Macintosh Quadra 950 can have:

- four half-height SCSI drives
  or
- two full-height SCSI drives
  or
- one full-height and two half-height SCSI drives
  or
- two removable media SCSI devices in front (floppy counts as one), and a combination of SCSI devices behind

Termination must be removed from drives whenever installed internally on the Quadra 950.

Motorola MC68040 Microprocessor

Central to the Quadra 950 is a new processor chip from Motorola, the 68040 (040) running at 33 MHz. The 040 running at 25 MHz and the 040 running at 33 MHz are functionally equivalent, and therefore should pose no compatibility issues with the Quadra 950. The hardware changes shouldn't affect application compatibility.

The 68040 is mounted to the logic board with a socket, and a heat sink is clipped onto the socket rather than glued to the 040. This allows easier servicing if required. It's important to close the case when the Quadra 950 is running to assure proper cooling of the 040.

IOPs

Improved I/O features also contribute to the higher performance of the Quadra 950 computer. Like the Macintosh IIfx, the Quadra 950 has intelligent I/O processors (IOPs) on the ports for the floppy disk, ADB, and serial I/O. These ASICs, which feature a built-in microprocessor, DMA controller, timer, and external Static RAM (SRAM) are used to off-load floppy disk, ADB, modem, and printer port interrupts. These are the same IOPs found in the Macintosh Quadra 900.

Configurations and What's in the Box

At introduction, there are three Macintosh Quadra 950 configurations:
- Floppy only
- 8/230MB
- 8/400MB

Each unit includes a power cord, keyboard cable, mouse, microphone, and System 7 Tune-Up disk.

The documentation includes:
- Getting Started with your Macintosh Quadra 950
- Macintosh User's Guide
- compatibility list

The VRAM kit is different from the kit sold initially for the Quadra 700/900. A new kit with faster (80ns) VRAM will replace the 100ns kits sold today.

Upgrades

An Upgrade for Quadra 900 customers to the Quadra 950 is available. The upgrade kit consists of the logic board only.

TOPIC ---

This article describes the Macintosh Quadra 950 video support, including a definition of convolution. Here is what the Quadra 950 gets with Apple monitors:

DISCUSSION ---

Quadra 950	12 Mono	12 RGB	13 RGB	16 RGB	15 Port	21 Mono	21 RGB
1 meg VRAM	8	24	16	16	8	8	8
2 megs VRAM	8	24	24	24	8	8	16

The VRAM slots on the Quadra 950 are located under the power supply, and are therefore difficult to access. It comes standard with 1 MB of VRAM. All four slots must be populated with 256K SIMMs when upgrading the Quadra 950 from 1MB VRAM to 2MB.

Because the Quadra 950 uses 80ns VRAM SIMMs, the frame buffer controller (DAFB) could be reprogrammed to remove one or more wait states from the VRAM access time, thus increasing the video speed 20%. Due to the increased speed of the processor, the total video speed improvement should reach 30%. The Quadra 950 comes standard with 1MB VRAM, which can be

expanded to 2MB using 80ns 256K VRAM.

The built-in frame buffer also supports several non-Apple monitors (VGA and Super VGA-800 x 600) and broadcast standards such as NTSC and PAL for interlaced displays. Convolution is included as an option for NTSC and PAL to reduce the flicker when using interlaced monitors. When connecting to an NTSC or PAL device, the ID pins on the cable indicate whether convolution is turned on. A special video adapter box is needed in order to connect the Quadra 950 to a television. Third parties such as Truevision, RasterOps, and Computer Friends provide the conversion of the RGB signal to a composite signal for NTSC and PAL. Because the video chip on the main logic board provides NTSC and PAL timing, the solution for a television display is significantly lower in cost than on other computers. In 24-bit mode, convolution isn't an option, but it is in black and white mode.

To locate a vendor's addreess and phone numbers, use the vendor name as a search string.

Definition of Convolution

The Macintosh Display Card 8•24, introduced in 1990, addressed the problem of screen flicker by implementing a new way of pixel averaging called Convolution. Convolution runs every pixel through a formula that averages the pixel with its individual neighboring pixels above and below, and its part of the function of the CLUT/DAC chip on Display Card 8•24.

Convolution causes a blurring effect between scan lines so that a horizontal line includes at least a portion of the scan lines above and below its own scan line. A portion of the horizontal line remains visible during display of both the odd and even fields, so flicker is avoided. The convolution formula follows a 1:2:1 ratio, where the current pixel value is given twice the weight of its neighbors above and below.

Convolution is automatically turned on where appropriate. If the on-board video on the Quadra 950 is driving an interlace display in 24-bit mode, convolution is disabled. If the card is driving an interlace display in 8-bit mode, or a lesser pixel depth, convolution is enabled.

Macintosh Quadra 950: SCSI Support (1/97)

Revised: 1/15/97
Security: Everyone

Macintosh Quadra 950: SCSI Support (1/97)

==========

Article Created: 18 May 1992
Article Reviewed/Updated: 15 January 1997

TOPIC ----------

This article describes SCSI support in the Macintosh Quadra 950.

DISCUSSION ----------

As in the Macintosh Quadra 900, the SCSI bus in the Macintosh Quadra 950 is divided into internal and external buses, each controlled by its own identical IC -- an NCR 53C96 device. Therefore, the internal and external SCSI buses are logically connected through software, but are electrically separate. The goal of this design was to develop a combination of controller, cabling, and termination for the internal SCSI devices which permits data transfer rates approaching the NCR 53C96 controller limit of 6MB/s. The cabling and termination of the internal SCSI bus are optimized so that the 53C96 that controls the internal bus can support data transfers at a faster rate: up to 5MB/s with existing faster third-party hard drives. The improved SCSI performance will result in increased system responsiveness when accessing large amounts of data on a fast hard drive.

The internal SCSI channel also supports an active termination which improves SCSI bus signal quality and reliability through improved transmission line and terminator design. This means that only one terminator is needed at the end of the external SCSI chain. The external channel's termination also offers a more uniform impedance and cleaner termination scheme. However, because external cabling and termination are less predictable, performance on the external bus could be lower than the internal. Electrically isolating the two channels ensures that changes in external cabling and termination don't impact the performance of the internal devices.

Even though the internal and external SCSI chains are physically different, they are still logically the same, and can therefore, like all Macintosh systems, accommodate up to seven SCSI devices. You must make sure that every device has a different SCSI ID number, regardless of which SCSI chain the device is connected

to. You cannot use SCSI ID 7, and SCSI ID 0 is usually reserved for the internal hard disk. The added value of the Macintosh Quadra 950 dual-controller design is that the internal hard drive(s) performance won't be affected by problematic devices (like a scanner) attached to the external SCSI connector. Improvements in signal quality on the SCSI bus results in higher SCSI reliability.

Macintosh Quadra 950: Integrated Circuits (6/94)

Revised: 7/1/94
Security: Everyone

Macintosh Quadra 950: Integrated Circuits (6/94)

==========

Article Created: 18 May 1992
Article Reviewed/Updated: 30 June 1994

TOPIC

The circuitry of the Macintosh Quadra 950 computer has many new features along with older features it shares with the Macintosh IIci and IIfx computers. Certain components appeared for the first time in the Macintosh Quadra 900, and are therefore present in the Quadra 950 as well:

- The MC68040 microprocessor
- Several new custom ICs
- The built-in video hardware
- The 68040 PDS slot.

This section describes the circuit design of the Macintosh Quadra 950.

DISCUSSION

There are three buses in the Quadra 950 computer:

- System bus
- I/O bus
- NuBus

The system bus connects directly to the pins of the MC68040 microprocessor and runs at the processor's clock rate of 33 MHz. The system bus is a high performance bus, with the capability to read burst-read and burst-write. Five controller ICs are connected to the system bus:

- Orwell, the custom memory controller
- YANCC, the NuBus controller
- DAFB, the frame-buffer controller
- The two 53C94 SCSI controllers

The I/O bus in the Quadra 950 computer is similar to the I/O bus in the Macintosh IIfx computer. The I/O bus in the Quadra 950 computer runs at a clock rate of 25 MHz. The controller ICs that are connected to the I/O bus include new custom ICs along with ICs originally designed for the Macintosh IIfx, such as the IOPs.

The NuBus runs at a clock rate of 10 MHz and includes several features of NuBus '90, including a clock signal at 20 MHz between cards, which is twice the normal rate. This clock rate doesn't apply from card to CPU.

Integrated Circuits (ICs)

The Quadra 950 incorporates all of the same ICs that the Quadra 900 did, many Apple custom ICs, and some new ASICs.

The Apple custom ICs that the Quadra 950 computer shares with earlier Macintosh models include:

- AC/DC: a custom Color Look-Up Table and Digital-to-Analog Converter (CLUT/DAC) IC developed by Apple and used in the Macintosh Display Cards 4•8, 8•24, and 8•24 GC, but improved in the Quadra 950.
- DFAC (Digitally Filtered Audio Chip): the sound input and filter IC first used in the Macintosh LC
- IOP: the I/O processors first used in the Macintosh IIfx
- SWIM: the IC that supports the SuperDrive disk drive

The Apple custom ICs that are newly designed for the Quadra 950 computer are:

- BATMAN: a custom IC (replaces the Apple Sound Chip) that acts as a sound amplifier
- SPORTY: a custom IC that provides sound output functions
- CABOOSE: a custom processor that manages system power, the real-time clock, and parameter RAM
- DAFB (Direct Attach Frame Buffer): an IC that connects directly to the system bus and controls the video RAM or frame buffer
- ORWELL: a custom IC that connects to the system bus and controls burst-mode data transfers to the main RAM
- JDB (Junction Data Bus): one of two ICs making up the I/O Adapter, connecting the data signals from the system bus and the I/O bus
- RELAYER: one of two ICs making up the I/O Adapter, controlling the bus buffers and proving bus arbitration logic
- YANCC (Yet Another NuBus Controller Chip): a custom IC that controls the NuBus interface

Third-party ICs include:

- SCSI interface ICs: two NCR 53C96
- Sonic: the DP83932 Ethernet controller IC made by National Semiconductor
- Two VIAs similar to those in earlier members of the Macintosh II family

I/O bus adapter ICs: JDB and Relayer

The I/O bus attaches local I/O devices to the system bus in a way that is flexible and highly compatible with previous Macintosh systems, and is fully buffered from the system bus to reduce capacitive loading. By putting Relayer and JDB between the system bus and I/O bus, none of the 040 signals go directly to the I/O chips, thus reducing the loading on the 040 bus signals, and increasing speed and reliability. The I/O bus hardware protocols are a subset of the 68030 bus protocols.

The two-chip set consisting of the Relayer and JDB provide a transparent connection between the system bus and the I/O bus. The I/O bus enables the Quadra 950 computer to use the same I/O device controllers used in the Macintosh IIfx. The I/O bus clock runs at 24.28 MHz and is completely asynchronous to the system bus clock.

This two-chip setup allows any system bus master such as the 040, a NuBus master card, or a master device on the PDS to request bus access and transfer data to slaves located on the I/O bus. It also allows I/O bus masters like SONIC to access main memory which is located on the system bus. This improves the overall speed of the system by isolating the faster bus (system bus) from the slower bus (I/O bus).

The I/O bus adapter is made up of two ICs: JDB and Relayer. Two ICs are used because of the high pin count required.

The functions of the Relayer IC include:

- Generating chip select and DSACK signals for devices on the I/O bus
- Converting timing signals between the system bus and the I/O bus
- Arbitrating between the system bus and the I/O bus
- Acting as watchdog for bus activity and time out
- Controlling the address-bus transceiver ICs
- Generating the clock signal for the VIA ICs

The functions of the JDB IC include:

- Controlling the data path (dynamic bus sizing and data byte lane routing)
- Synchronizing and distributing the reset signals

The ICs making up the I/O bus adapter contain no programmable registers and don't require support from the system software.

Memory Controller IC: Orwell

The Orwell IC connects to the system bus and provides control and timing signals for RAM and ROM. The Orwell IC supports all types of MC68040 memory access, including burst modes. Orwell allows all memory to be marked cache-able, which means cache-inhibit isn't asserted.

When the computer is reset, the Orwell IC maps ROM addresses into memory beginning at address $0000 0000 and disables the system RAM. As soon as the ROM code addresses the normal ROM space ($4000 0000), the Orwell IC automatically remaps the ROM to its normal addresses and restores RAM addressing starting at $0000 0000. The microprocessor always starts upon

reset at address 0. At that time there is nothing in RAM (which resides at address 0 after reset). Therefore, ROM code needs to be accessed, and since its normal addressing starts at $4000 0000, it's remapped down so the processor has some code to fetch upon reset. This is the same process in every Macintosh II.

RAM Control

The Orwell IC controls four banks of dynamic RAM. Each bank accepts standard 80ns SIMMs containing 1MB, 4MB, and perhaps 16MB (256K and 2MB aren't supported), giving total memory sizes from 8MB to 16MB for each bank (256MB if 16MB SIMMs work). Therefore, the Quadra 950 could have a total of 64MB when using the SIMMs currently available. 16MB SIMMs haven't been thoroughly tested on the Quadra 950, and therefore can't be listed as a possible configuration. The Quadra 950 can also use 60ns SIMMs, but Orwell is programmed for 80ns DRAM, so a 60ns SIMM wouldn't improve the speed. If one slot in a given bank is filled, then all slots in the bank must be populated.

Note: When large amounts of DRAM are installed, the memory check upon startup is lengthy and can cause users to think that the computer isn't functioning. There is no software indication that the computer is running memory checks.

The Orwell IC contains registers that the system software uses to set the starting address of each bank of memory. At startup, the system software determines the sizes of the banks and assigns the bank starting addresses so that the banks occupy contiguous memory spaces, unlike that of the Macintosh IIci and IIsi, which have split memory maps.

ROM

The ROM in the Quadra 950 is soldered directly to the main logic board, and consists of two 4MBit ROMs at 150ns (each ROM is a 256K x 16 device)=1MB ROM. As with all instructions, ROM can be cached in the 040. The memory controller, Orwell, supports burst access to the ROM via the 68040 fake burst mechanism. This means that Orwell asserts Transfer Burst Inhibit (TBI) with TA for accesses to ROM, which can't be "bursted." This allows the 040 to try a burst, and then notice that it must do the accesses in four individual long words.

SCSI Controller ICs

In the Quadra 950, the SCSI bus is divided into internal and external buses, each controlled by its own NCR 53C96 device. The internal and external SCSI buses are logically connected, but electrically separate. The external bus is electrically isolated from the internal bus so that changes in external cabling and termination have no effect on the performance of the internal SCSI devices.

The cabling and termination of the internal SCSI bus are optimized so that the 53C96 that controls the internal bus can support data transfers at a faster rate -- up to 5MB/s (the maximum the chip can transfer is 6MB/sec).

Earlier Macintosh computers were capable of a 3MB/s transfer rate.

NuBus Controller IC: YANCC

In the Quadra 950 computer, the interface between the system bus and the NuBus comprises three chips: the YANCC IC and two 16-bit transceiver ICs that are the same as the ones in the Macintosh IIci.

The YANCC IC maps certain system bus cycles to NuBus cycles and certain NuBus cycles to system bus cycles. The features of the YANCC IC include:

- Support for all types of single data transfers in either direction
- A buffer, one long word deep, for appended writes from the MC68040 to the NuBus
- Support for block move transfers between NuBus masters and main memory
- Support for pseudo-block transfers between the MC68040 and NuBus slaves
- Support for some new functions defined in the NuBus '90 specification

Unlike the NuBus controllers in previous Macintosh computers, the YANCC IC generates an interrupt when there is an error involving the write buffer. Software controls this interrupt by means of a control and status register in the YANCC.

Video Frame-Buffer Controller IC: DAFB

The built-in video hardware in the Quadra 950 computer provides high-performance graphics on all current Macintosh monitors. The video hardware is built around a video frame buffer controlled by the DAFB IC.

The video frame buffer comprises four banks of video RAM (VRAM); two of which are soldered onto the logic board. This minimum configuration (1MB soldered on) supports 16 bits per pixel on all Apple monitors up to 16 inch, and 8 bits per pixel on all Apple monitors. The basic VRAM configuration supports 24 bits per pixel on the 12-inch RGB monitor. The standard 1MB VRAM also supports NTSC and PAL monitors, using Apple convolution as well as VGA monitors. By installing VRAM SIMMs into the other two banks (four 256K VRAM SIMMs), the user can expand the frame buffer to support 24 bits per pixel for the 13-inch and 16-inch monitors.

Because the frame buffer in the Quadra 950 computer is connected directly to the system bus, which is now even faster than the Quadra 900, it speeds up all applications, even those that don't use QuickDraw. Given the faster clock speed, and the removal of wait states in the VRAM timing, the Quadra 950 frame buffer can perform graphic operations, such as scrolling, up to 50% faster than the Quadra 900 frame buffer.

The control registers in the DAFB IC and the frame-buffer VRAM are mapped into the memory locations that were assigned to NuBus slot $9 in earlier models.

Sound ICs: DFAC, Batman, and Sporty

The Quadra 950 computer uses a new sound system. Its features are similar

to the features of the sound interface in the Macintosh LC and the IIsi. The features of the Quadra 950 sound interface include:

- ASC compatibility
- Ability to play 8-bit sound files
- 8-bit sound input
- Lower noise and distortion analog circuitry

Four Apple custom ICs provide the sound interface:

- DFAC: provides sound input and an anti-aliasing filter
- Batman: an updated version of the Apple Sound Chip
- Sporty: a custom IC that replaces the two Sony sound ICs
- External digital-to-analog converter (DAC)

The Digitally Filtered Audio Chip (DFAC) is an Apple custom IC that is also used in the Macintosh LC. The DFAC IC includes the anti-aliasing filter and analog-to-digital converter (ADC) for sound input. It also contains a digital filter for conditioning output data before it is sent to the DAC. The DFAC serializes the sound input information and sends it to Batman, where it is put into a FIFO, which software can read.

The Batman sound chip provides ASC compatibility and includes several important new features such as support for sound input, support for an external D/A converter, and large FIFOs which buffer playback and sound input samples. Batman doesn't support the wave table function which was available in the original ASC (this feature was not widely used and should only cause very limited compatibility problems). The Batman transfer acknowledge is generated by Relayer.

For sound output, an external DAC provides higher-quality sound than that generated by the PWM system used in earlier Macintosh models. The Sporty custom IC replaces the two Sony ICs used in earlier models and provides better sound quality (that is, less noise and distortion). Like the Sony ICs it replaces, the Sporty IC also contains digital attenuators. A separate amplifier with power output of 2 watts drives the larger speaker used in the Quadra 950 computer.

Macintosh Quadra 950: Connectors

==========

Article Created: 18 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

This article discusses the Macintosh Quadra 950's:
- microphone and Mic In connectors
- audio Line In connectors
- sound out connector and speaker
- Ethernet connector

DISCUSSION -----

Microphone and Mic In Connector

The Macintosh Quadra 950 computer includes a microphone, and a Mic In connector in the back. The microphone is similar to the one provided with the Macintosh IIsi and LC, but it has a longer cable to allow it to reach the floor-standing case.

Audio Line In Connectors

The audio Line In connectors are standard phono connectors intended for users who wish to use the computer to sample line-level devices such as home stereo systems. The signals from the Line In connectors are internally mixed to a single (monophonic) audio signal; that signal is combined with the input from the Mic In connector and then sent to the sound input circuit.

Note: Even though there are two Line-In connectors, the stereo channels are mixed into a single monophonic signal; therefore stereo information is lost. For the user's convenience, the computer has two connectors so that an external mixer isn't needed when connecting the computer to the most common type of consumer audio equipment.

Sound Out Connector and Speaker

The Sound Out connector on the Quadra 950 computer is similar to the one on the Macintosh II and has the same electrical characteristics. The audio amplifier for the internal speaker is more powerful than those on other Macintosh, models so that it can drive the speaker at higher sound levels (approximately 2 watts per channel compared to .25 watts per channel on the Macintosh II). The higher levels are required because the computer is normally on the floor and thus farther from the user.

Ethernet Connector

The Ethernet implementation on the Quadra 950 is the same as on The Quadra 900. Ethernet is implemented using the National SONIC Ethernet controller chip. This device includes an IEEE 802.3 encoder/decoder (ENDEC), media access control (MAC) unit, separate 32-byte send and receive FIFOs, and DMA controller in one device. SONIC is housed in a 132-pin PQFP package. The Ethernet global address (which provides a unique 48-bit identity for each CPU built) is provided by a small ROM.

The SONIC controller includes DMA capability. It will request the bus and transfer data between its internal registers and main memory.

The Ethernet connector on the Quadra 950 computer is the Apple AUI (AAUI) connector, which accepts any FriendlyNet adapter. There is a different FriendlyNet adapter for each of the different kinds of Ethernet standard cable:

- The AUI (thick) cable

- CheaperNet (thin) cable

- 10BASE-T (twisted pair) cable

The speed of the I/O bus has been improved to 25 MHz over the 16 MHz of the Quadra 900. This speed increase can improve Ethernet throughput by 20%.

Macintosh Quadra 950: Expansion Slots

Revised: 5/15/92
Security: Everyone

Macintosh Quadra 950: Expansion Slots

==========

Article Created: 18 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

The Macintosh Quadra 950 computer has five NuBus slots and one PDS (processor-direct slot) line with NuBus slot $E and uses the same opening in the back. The use of a PDS card precludes the use of a NuBus card in slot $E.

DISCUSSION ----------

NuBus slots

NuBus in the Quadra 950 provides all the benefits found in the Quadra 900:

- Provides higher power

- Accommodates oversized NuBus cards

- Supports some of the NuBus '90 features

Higher Power

The power supply in the Quadra 950 computer is designed to provide additional current on the +5V outputs for the NuBus slots, compared with the current specified in "Designing Cards and Drivers for the Macintosh Family," second edition. The Quadra 950 has enough power to support a total of two 25-watt cards and three 15-watt cards.

Oversized NuBus Cards

Each NuBus slot can accommodate either a standard NuBus card or an oversized card. The oversized card is the same length as a standard NuBus

card, but it is 2 inches taller. Each NuBus slot in the Quadra 950 computer includes a card guide; to install an oversized card, the user removes the card guide.

NuBus '90 Features

NuBus '90 is the 1990 proposal for revision of the IEEE standard for the NuBus (IEEE STD R1196-R-1990). Apple has a representative on the panel designing the new standards, and has had since its inception. The specifications for NuBus '90 are incomplete and still under development, but Apple has implemented the portion of the specifications that are completed. Apple will be updating the implementation as the specifications expand and stabilize. The NuBus slots in the Quadra 950 computer provide the following new features described in that proposal:

- Low current at +5 V is available on the new STDBYPWR pin when main power is off and the AC cord is plugged in.

- New signals /TM2, /CLK2X, and /CLK2XEN support block transfers at double the standard rate (20 MHz). The Quadra 950 computer allows double-rate block transfers between NuBus cards, but doesn't support double-rate transfers to or from the main memory (this remains at 10 MHz).

- NuBus '90 defines new signals SB0 and SB1 for a serial bus on the formerly reserved pins A2 and C2. The serial-bus signals are bused and terminated, but the main circuit board doesn't drive them.

- NuBus '90 defines new signals /CM0, /CM1, /CM2, and /CBUSY to support a cache coherency protocol. Pins on the NuBus connector are assigned to those signals, but the Quadra 950 system doesn't support them.

Processor-Direct Slot

For maximum performance, the processor-direct slot (PDS) is connected directly to the MC68040 microprocessor by way of the system bus. Possible applications for a PDS expansion card include cache memory, a video frame buffer, a DMA-based I/O controller, expansion memory, or even an additional MC68040 microprocessor. When a PDS card is installed, slot $E is unavailable for a NuBus card.

A PDS card can have memory locations in the upper part of the RAM memory space or in the space assigned to NuBus slot $E. If the card uses slot $E addresses, it must decode all addresses in both the slot space and the super slot space, responding to any access to an unused location with a TEA on the processor bus to indicate an illegal address.

A typical PDS card maps into the NuBus space and works with the system software's Slot Manager. Such a card must contain a NuBus declaration ROM and must notify the NuBus controller that it is using the NuBus space by asserting (pulling low) the signal /PDS.SLOT.E.EN on the PDS connector.

WARNING: A PDS expansion card for the Quadra 950 computer must be designed to work with the MC68040 microprocessor; PDS cards designed for computers

that use the MC68020 or the MC68030 won't work in the Quadra 950 computer.

A PDS card for the Quadra 950 computer has the same dimensions as a NuBus card and can include a back-panel connector. When the PDS card is installed, it occupies NuBus slot $E, reducing the number of available NuBus slots from five to four. Any PDS card designed to operate in the Quadra 950 must be capable of meeting the 33 MHz timing specification for the Motorola 68040. This requires shorter output delay times than the 25 MHz timing. Otherwise, PDS connector pinouts, size and placement are identical among the Macintosh Quadra 900, 700, and 950.

IMPORTANT: The signals on the PDS connector are connected directly to the MC68040 with no buffers. Therefore the address, data, and clock lines on a PDS card must present capacitive loads of not more than 40 pF. The control lines must present capacitive loads of not more than 20 pF.

Macintosh Quadra 950: Specifications

==========

Article Created: 18 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

This article gives the technical specifications for the Macintosh Quadra 950 computer.

DISCUSSION -----

Microprocessor

- Motorola 68040, 32-bit architecture, 33 MHz clock speed

- Integral Paged Memory Management Unit (PMMU), Floating Point Unit (FPU), and 8-kilobyte cache architecture

I/O Speed

- 25 MHz

Memory

- Comes with 8MB of RAM standard and eight memory expansion slots for 80ns SIMMs (Single In-line Memory Modules).

- Expandable to 64MB of RAM by installing 4MB SIMMs in all 16 slots.

Disk Drives

- Built-in Apple SuperDrive 1.4MB floppy disk drive

- 230MB or 400MB internal Apple SCSI hard disk drive (optional)

- Support for four internal SCSI devices, such as a CD-ROM or DAT drive, or SCSI hard disk drive (several capacities available)

Video Display

- Up to 16 bpp video support for most Apple monitors standard (15-inch portrait and 21-inch landscape require 2MB VRAM)

- Supports all Apple monochrome and color monitors, including:
  - Macintosh 12-inch RGB Display
  - Macintosh 12-inch Monochrome Display
  - AppleColor High-Resolution RGB Monitor
  - Macintosh Portrait Display
  - Macintosh Two-Page Monochrome Monitor
  - Macintosh 21-inch Color Display

- Supports some other non-Apple monitors, including VGA, NTSC, and PAL.

- 24 bpp video support on 12-inch (1MB VRAM), 13-inch, NTSC, PAL, 16-inch with 2MB VRAM.

Video RAM

- 1MB, upgradable to 2MB for display of more colors or shades of gray

Interfaces

- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other devices daisy-chained through a synchronous serial bus

- Two serial (RS-232/RS-422) ports, 230.4 kilobits per second maximum (up to 0.920 megabits per second if clocked externally)

- SCSI bus interface

- Video port to support RGB and monochrome monitors of various sizes and resolutions

- Five internal NuBus expansion slots

- One 68040 PDS (processor-direct slot) provides access to the CPU for highest possible performance.

- Stereo sound output port capable of delivering sound to both channels of a stereo device

- Sound input port for monaural sound input

- Two audio line input ports (stereo input is mixed to a monophonic signal)

- AUI-15 Ethernet connector

Keyboard

- Supports all ADB (Apple Desktop Bus) keyboards.

Mouse

- Apple Desktop Bus Mouse; mechanical tracking, optical shaft, or contact encoding

Sound Generator

- Custom sound chip drives stereo miniature phone jack headphones or stereo equipment.

Clock/Calendar

- Custom chip with long-life lithium battery

Microphone

- Electret, omnidirectional; output voltage is 4 millivolts, peak-to-peak, at normal volume.

Disability Access

- CloseView, Easy Access, and visible beep included with system software. These built-in features and third-party options provide alternative input and output tools for people with disabilities.

Electrical Requirements

- Line voltage: 100 to 240 volts AC, RMS automatically configured

- Frequency: 59 to 60 Hz, single phase

- Power: 303 watts maximum, not including monitor power

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 milliamps (a maximum of three ADB devices is recommended)

- Mouse draws 80 milliamps.

- Keyboard draws 25 to 80 milliamps, depending on the keyboard model used.

Operating Environment

- Operating temperature: 50 F to 104 F (10 C to 40 C)

- Storage temperature: -40 F to 116.6 F (-40 C to 47 C)

- Relative humidity: 20% to 80% noncondensing

- Maximum altitude: 10,000 ft. (3,048m)

Size and Weight

- Main unit
  - Height 18.6 inches (47.3 cm)
  - Width 8.9 inches (22.4 cm)
  - Depth 20.6 inches (52.3 cm)
  - Weight 36 lb. 12 oz. (16.7 kg)*

- Mouse
  - Height 1.1 inches (2.8 cm)
  - Width 2.1 inches (5.3 cm)
  - Depth 3.8 inches (9.7 cm)
  - Weight 6 oz. (.17 kg)

 * Weight is greater with an internal hard disk.

Noise Level

  < 40 db (floor standing position) measured from the seated operator position.

AppleTalk Remote Access: V.42bis Data Compression

Revised: 5/21/92
Security: Everyone

AppleTalk Remote Access: V.42bis Data Compression

==========

Article Created: 18 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I heard that using AppleTalk Remote Access uses software to turn off the V.42 compression built into some modems. Do you know if this is the case? If it is, is there some way to prevent it?

DISCUSSION -----

Here are a few terms clarified for this discussion:

MNP Level 4 = Error Correction
MNP Level 5 = Data Compression (2:1)

v.42 = Error Correction
v.42bis = Data Compression (4:1)

v.32 = 9600 baud
v.32bis = 14.4K baud

AppleTalk Remote Access (ARA) provides MNP Level 4 error correction and v.42bis data compression in software. There's no way to disable these features in ARA. ARA doesn't do MNP Level 5 data compression nor v.42 error correction.

The main reason ARA does MNP Level 4 error correction and v.42bis data compression in software and inside the Macintosh is for reliability. The Macintosh serial connection isn't nearly as reliable at 57.6K baud as it is at 9600 or 19.2K baud. If ARA were to use the v.42bis ability of a 9600 baud modem, the connection between the Macintosh and the modem would have to be 57.6K baud for maximum performance. By doing the compression and decompression in the Macintosh via software, the connection between the

Macintosh and the modem need only be at 9600 baud for v.32 modems. For v.32bis modems (14,400 baud) the connection should be 19.2K baud.

ARA also uses a proprietary technique called "Smart Buffering" that is only possible if the error correction and data compression are done in software. Due to the more reliable serial connection and the "Smart Buffering," ARA provides superior performance using software-based error correction and data compression.

Macintosh LC and LC II: Expansion Card Differences

Revised: 7/21/92
Security: Everyone

Macintosh LC and LC II: Expansion Card Differences

==========

Article Created: 18 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

We purchased a large number of Macintosh LC II computers and Avatar Ethernet cards. The cards aren't working. According to Avatar, they tested the card, along with their coax and Token Ring cards on a prototype Macintosh LC II, and they worked fine. The coax and Token Ring cards are working in the production LC II, but the Ethernet card seems to have a problem.

When the card is in the Macintosh LC II, it hangs when the computer restarts. When we remove the card and restart the computer, AppleTalk is off. We then replace the card, and the computer starts, but if we turn AppleTalk on and restart, it hangs again. We get a message to restart the computer to toggle AppleTalk on and off.

DISCUSSION ----------

There are some basic differences between the Macintosh LC and the Macintosh LC II that developers of expansion cards need to consider. These differences are documented in the Macintosh LC II developer notes.

These are the two primary differences:

- The 68030 generates a bus error when addressing a non-existent memory, and the 68020 does nothing to detect these errors.

- The NuBus FC3 function code signal is always driven high on the Macintosh LC II. This determines whether 24- or 32-bit addressing is used.

These differences could be enough to cause some cards/drivers to have problems in the Macintosh LC II. We provided this information to our

developers and encouraged them to offer software patches/ROM upgrades for any affected cards.

Macintosh Quadra: Internal CD-ROM Players

Revised: 7/21/92
Security: Everyone

Macintosh Quadra: Internal CD-ROM Players

==========

Article Created: 18 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What internal CD-ROM players are available for the internal bay of a Macintosh Quadra 900 or 950?

DISCUSSION ----------

There are a number of third-party options, including MicroNet Technology, Peripheral Land, Inc., and MicroTech. You can obtain these CD-ROMs from computer retailers, or directly from the manufacturers.

Apple CD-ROM players fit, but we don't (nor does anyone else to our knowledge) provide the mounting hardware or audio and power cables.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Macintosh Quadra 950: Color Addition Extension (10/94)

Revised: 10/3/94
Security: Everyone

Macintosh Quadra 950: Color Addition Extension (10/94)

==========

Article Created: 18 May 1992
Article Reviewed/Updated: 3 October 1994

TOPIC ----------

When a color monitor is connected to the on-board video circuitry of some early Macintosh Quadra 950 systems, AND the Monitors control panel is set to millions of colors, certain color manipulation commands may not work in some graphics application programs. The problem isn't destructive. The system won't crash, and data won't be corrupted.

To correct the problem, upgrade to system software version 7.1 or later. Or install the system extension called 950 Color Addition, as described below.

DISCUSSION ----------

What Is the 950 Color Addition Extension?
---
950 Color Addition is a system software extension that fixes a minor problem on Macintosh Quadra 950 computers. This extension has no function on other Macintosh models.

Where Do I Get It?

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates"
  Lists online services for "free" Apple software updates.

- "Obtaining Apple Product Support in the USA"
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

How To Install It
---
1) Insert the "Macintosh Quadra Extra" floppy disk in the floppy disk

drive.

2) Drag the 950 Color Addition icon into the System Folder on your startup disk.

3) When a message asks you if you want the 950 Color Addition to be stored in the Extensions folder, click OK.

   Note: If the 950 Color Addition is already installed in your Extensions folder, you don't need to reinstall it. When you are asked whether you want to replace the 950 Color Addition, click Cancel.

4) Restart your Macintosh Quadra 950.

If you Reinstall System Software

If you later reinstall system software, you will need to repeat the above procedure.

Article Change History:
03 Oct 1994 - Removed file from article and added new "Where Do I Get It?" information.
19 Jan 1993 - Updated with System Software version 7.1 information.

Apple Internal 230MB Hard Drive: Specifications

Revised: 7/21/92
Security: Everyone

Apple Internal 230MB Hard Drive: Specifications

==========

Article Created: 18 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

This article provides the technical specifications for the 230MB internal hard disk drive.

DISCUSSION -----

Capacity

Formatted capacity: 232MB
Formatted sector size: 512 bytes
Sectors per track: 44 to 87
Total data tracks/surface: 1,930
Total data sectors (blocks): 471,140

Performance

Track to track: 4 milliseconds, including settling
Average access time: 16 milliseconds, including settling
Full stroke: 28 milliseconds, including settling
Average latency: 7 milliseconds
SCSI Data Burst Rate: ≥ 5.0 megabytes/second (CPU/bus dependent)
Time to ready from power on: <20 seconds
Time to stop from power down: <20 seconds

Environmental

Exceeds all Macintosh system environmental specifications: operating and non-operating temperature, humidity, altitude, vibration, and shock.

Size and Weight

Dimensions: 150 x 102 x 25.4 millimeters (1/3 height, 3.5-inch form factor)
Weight: 0.85 kilograms (30 ounces) not including mounting carrier

Miscellaneous

Encoding Method: 1,7 RLL (Run-Length Limited)
Servo mechanism: optical encoder servo
Actuator type: balanced rotary voice coil
Landing zone: dedicated (not on data)
Head park and lock: the actuator automatically parks and locks in the
landing zone at power down.
Mounting: any mounting orientation is supported.

PowerBook: Using HyperCard To Dial Voicemail and Play Messages

Revised: 5/16/94
Security: Everyone

PowerBook: Using HyperCard To Dial Voicemail and Play Messages

==========

Article Created: 17 June 1992
Article Reviewed/Updated: 13 July 1992

TOPIC ----------

I'm trying to use HyperCard to dial my Macintosh PowerBook modem to call my voicemail, so I can listen to my messages through the speaker.

I can use the dial command in HyperCard to dial the modem, but when I try to enter my extension and password, the modem resets.

I can also use the serial XCMDs, send the ADT command, get a constant dial tone, and then use the dial command to send the number, but this doesn't work either.

DISCUSSION ----------

You need to modify your dial command and write button scripts to send the appropriate serial commands to the modem.

1) Issue the command ATM1 to tell the speaker to remain on.

2) Time the necessary pauses for the voicemail system when it asks you to select/press buttons for options, and so on.

   Each comma you insert into the dial string adds 1 second to the dial time. For example:

   ATDT 9,,555-1212;

   dials 9, waits 2 seconds for the phone system (usually for PBX) to respond, and then continues to dial the number.

3) Add a semicolon to the dial string (as shown in the example above). When the semicolon is reached, the modem drops back into command state -- instead of trying to make a connection.

If your string is longer than 40 characters, you must use multiple dial strings since the PowerBook Fax/Data Modem has a 40-character limit. You can enter multiple dial commands by issuing a semicolon, which puts the modem back into the command state. Then type the ATDT XXXXXXXXX; for additional tones you need to send.

4) Issue an ATH0 when you want to hang up the modem.

System 7.0.1: False "Disk Unreadable" Message w/Removable Media

==========

Article Created: 19 May 1992

Article Change History

01/12/93 - CORRECTED
- To show the correct version of system software

TOPIC ----------

Occasionally, my Macintosh Quadra gives me the error message, "This disk is unreadable, do you want to initialize?" -- with "Eject or Initialize" as my options. This happens only when I have a CD-ROM or other removable media (such as a cartridge drive) connected.

DISCUSSION ----------

This is caused by a harmless SCSI Manager bug that is fixed in System Software version 7.1. This seems to happen randomly with Quadras and System 7.01 when you have a CD-ROM or other removable-media devices connected.

When you get this error message, click the Eject button. If you click the Initialize button, you'll get this message, "Initialization failed! This disk is write-protected!" with an "OK" button.

AppleShare Print Server: Hiding the Chooser's Non-Spool Listing

==========

Article Created: 19 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I leave AppleShare Print Server (version 2.0 or 3.0) running 24 hours a day and have a LaserWriter captured -- bypass disabled, so that users see the Print Server entry in the Chooser, but not the print-direct entry.

At night, I turn off the LaserWriter. In the morning, when I turn on the LaserWriter, both the LaserWriter and the spooler version of the LaserWriter appear in the Chooser. Should this happen?

DISCUSSION -----

This a known problem, and there are two ways to correct it:

- Release the printer and recapture it.

- Send a print job to the LaserWriter through the spooler.

Printing directly to the LaserWriter does not remove the direct Chooser listing.

Networks: How to Have a Server Control Time Stamps

Revised: 7/16/92
Security: Everyone

Networks: How to Have a Server Control Time Stamps

==========

Article Created: 19 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

How is the "Last Modified" column for servers affected when users have different times set on their Macintosh computers -- for example, when some users reset their clocks for daylight savings time and some don't?

DISCUSSION -----

The time stamp shown in the Last Modified column for servers changes from machine to machine, depending on USER'S clock setting. To see this, mount any server and note the time stamp of a file. Dismount the server, and change your clock by 1 hour. Now re-mount the server, and the time stamps have all changed by 1 hour.

This is a known problem that can affect applications that depend on time stamps; however, there are utilities available that synchronize all Macintosh computers with the server's clock.

One free utility for this is Macintosh Timelord/Tardis 1.3. Timelord (Chooser Extension) lets a networked Macintosh act as timeserver to other Macintosh computers connected to it. Tardis (Control Panel) is the client.

Macintosh Timelord/Tardis is available through ftp on the Internet and from user groups.

Macintosh Quadra 900 Tech Procedures: Pixel Depth Correction

Revised: 7/14/92
Security: Everyone

Macintosh Quadra 900 Tech Procedures: Pixel Depth Correction

==========

Article Created: 14 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Currently we have two sources of information on pixel depth for the Macintosh Quadras:

- Technical Procedures for the Quadra 900, p. 5.4 (Additional Procedures)

- A Tech Info Library article titled "Macintosh Quadra: Pixel Depth for Various VRAM Configurations"

There is a discrepancy between them when comparing "PAL with convolution." Technical Procedures says "millions" of levels, while the Tech Info Library article says 256 levels.

DISCUSSION -----

The Quadra 900 Technical Procedures are incorrect, and will be corrected in a future version.

A/UX 3.0: "scn_open request for write" Error & Wrkaround (6/96)

==========

Article Created: 13 May 1992
Article Reviewed/Updated: 28 June 1996

TOPIC ----------

I recently attempted to launch A/UX 3.0, the boot process halted with the screen displaying, in the upper left hand corner, scn_open : request for write. What happened? How I can get A/UX to launch properly?

DISCUSSION ----------

We searched for the "scn_open : request for write" error message, and this bug was reported in an A/UX bug report. Here is the description of this bug and workaround:

After running newconfig/autoconfig and moving the root disk to another machine, the error message "scn_open: write failed" may occur, and the toolbox will not startup.

The problem is that if "launch" detects that autoconfig needs to run, it will boot /newunix instead of /unix. /newunix's major device numbers in this case no longer match the major device numbers of the root file system. This causes the toolbox "startmac -o minimal..." to bail as the major number for the uinter driver doesn't match the entry position in the device switch table. Instead, it now matches the scanners entry point, and scn_open() is being called instead of ui_open()!

The correct solution is to hard-code the major device numbers within the master.d files, but as this solution is not viable at this time, a quicker hack is to have "launch" from Startup set the verbose flag "-v" when it detects that it must do an autoconfig. This is very simple, and will fix most cases. There may be cases where other devices have "moved" with respect to /unix vs. /newunix, which may be catastrophic, but not sure at this point.

Other scenario has also been found to produce the same problem, like Ctrl C out

of newconfig debugger after asking for IP address information. The workaround to this is to run "launch" from A/UX Startup with the verbose "-v" flag.

Ofoto: Saving Images as MacPaint Files

Revised: 7/14/92
Security: Everyone

Ofoto: Saving Images as MacPaint Files

==========

Article Created: 12 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm using the Apple OneScanner and Ofoto 1.0 with system software version 6.0.7 or 6.0.8, and I'm attempting to save a file as a MacPaint file.

The manual said to scan at 72 dpi in black and white, which I did. When I tried to "Save As…" a MacPaint file format, the option was grayed out. Is there a way to use the MacPaint option?

DISCUSSION ----------

In versions 1.0, 1.0.1, and 1.1 of Ofoto (in other words, all versions to date), you must use one of the following settings in the Scan Controls windoid to have the MacPaint option available in the "Save As…" dialog:

Calibration: Screen Blk & Wht
Image Type: Line Art (Autodetect unchecked)
Auto radio button selected

- or -

Calibration: Screen Blk & Wht
Image Type: Photo (Autodetect unchecked)
Auto radio button selected

- or -

Calibration: Screen Blk & Wht
Image Type: Autodetect checked
Auto radio button selected

The choice of Manual or Auto radio buttons is an important one. None of the Manual settings provide the MacPaint option in the "Save As…" dialog.

The first setting above allows you to scan a color or gray-scale image as a high contrast black and white line art image without any dithering. The saved MacPaint file will also be a black and white line art image without dithering.

The second setting allows you to scan a color or gray-scale image as a gray-scale image. The saved MacPaint file will be a dithered black and white image.

The third setting produces one of two results, based on the type of original artwork scanned:

- A black and white line art image results if the original is line art. The MacPaint file will be line art.

- A gray scale image will be created if the original is a color/gray scale image. The MacPaint file will be a dithered black and white image.

ImageWriter LQ: Using with Apple IIe Card

==========

Article Created: 14 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm trying to use the ImageWriter LQ with my Macintosh LC with the Apple IIe Card installed. When I print from Macintosh software, everything works fine. When I try to print from Apple IIe software, it looks like printing is going to start, but the printer never responds and the program never returns from trying to print.

DISCUSSION ----------

The ImageWriter LQ defaults to a baud rate of 19,200. The Macintosh defaults to 19,200. However, the Printer Card device in the Option Panel defaults to 9600. This is what causes the print job to fail.

To get the Apple IIe Card out of the attempt to print to the ImageWriter LQ, power off the ImageWriter LQ. This will cause most applications to abort the attempt to print, and return to normal operation, thus retaining any unsaved work.

There are two workarounds:

- If you AREN'T using the ImageWriter LQ from the Macintosh, set the DIP switches on the LQ to 9600. This is SW2-1 closed and SW2-2 closed. It's the opposite of the default (both switches open), and allows use of the Printer Card device in the IIe Card Option Panel.

- If you're using the ImageWriter LQ from both the Macintosh and the IIe Card, then you need to make changes in the IIe Card Option Panel.

  1) Go to the Slots device, and move the Printer Card icon from slot 1 to the Spare Cards area.

2) Select the appropriate Serial Card icon (modem port or printer port), and place it in slot 1.

3) Select the appropriate Serial Card icon (printer port or modem port) from the scrolling device list.

4) In the Serial Card's settings make sure the following are set:

Device Connected:

- Other Device (Use Settings Below)

Port Characteristics:

Baud Rate:	19200	Auto Line Feed:	Off
Data Format:	8 Data/1 Stop	Interrupts:	Off
Parity:	None	Serial Card Mode:	Printer
Line Length:	80 Characters	Handshaking:	XON/XOFF

Macintosh Quadras: Using AppleTalk Phase 1

Revised: 7/14/92
Security: Everyone

Macintosh Quadras: Using AppleTalk Phase 1

==========

Article Created: 12 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I'm connecting Macintosh Quadra systems using the internal Ethernet card and the AppleTalk Phase 1 driver on an AppleTalk Phase 1 internetwork. I want to stay with AppleTalk Phase 1. Why must Macintosh Quadra systems use AppleTalk Phase 2 only?

DISCUSSION -----

It's possible to attach a Macintosh Quadra, using its built-in Ethernet port, to an AppleTalk Phase 1 EtherTalk network using the EtherTalk 1.2 adev. However, this configuration isn't supported because it wasn't tested. In fact, using a NuBus Ethernet card like the Apple Ethernet NB Card or EtherTalk NB Card (Rev. M or later) isn't supported, but appears to work as well. Again, this configuration wasn't tested and isn't supported.

The bottom line here is that everything will most likely work properly. However, if it doesn't, our advice will be to upgrade to AppleTalk Phase 2 EtherTalk.

Security: Everyone

Macintosh Quadra: NSI 1.2 Resolves LocalTalk Conflict (1/95)

==========

Article Created: 27 May 1992
Article Reviewed/Updated: 31 January 1995

TOPIC ----------

Did AppleTalk 57 shorten the data packet, thus correcting some problems between the Macintosh Quadra and Farallon's Star Controller?

DISCUSSION ----------

General Information

Some customers have experienced problems when using Macintosh Quadra computers on LocalTalk networks, including the inability to access LocalTalk services, and poor LocalTalk network performance. These problems are caused by the Quadra transmitting a number of abort bits (used to demarcate the end of a frame) outside the recommended range. The workaround is to update your LocalTalk resources with the NSI (Network Software Installer) 1.2 or later.

Those encountering the problem might report that:

- LaserWriters or servers disappear from the Chooser.

- Documents print fine once, then subsequent print commands yield PostScript errors or "printer not found" messages.

- Network performs slowly (for example, slow printing and file transfer, and device times out).

The problem most often occurs on a Quadra 700, since a Quadra 900 or 950 is out of compliance only when the PICs are turned off. Turning the PICs off is possible with the Serial Switch, which isn't commonly available or used.

Note that some third parties previously advised all Quadra owners encountering this problem to update to AppleTalk v57.0.1, which helped in many cases, but doesn't resolve this problem entirely. Therefore, customers encountering this

problem should use the NSI 1.2 or later.

Abort Bit Problem Only with LocalTalk

AppleTalk v56 is located in the Quadra's ROMs. The NSI 1.2 or later patches out AppleTalk in ROM and also installs two updated 'ltlk' resources.

Note that Apple never shipped AppleTalk v57. Before releasing AppleTalk v57, we found a bug in ADSP at the last minute, fixed that problem, then changed the name of the code to AppleTalk v57.0.1.

This abort bit problem, if it occurs, will only occur with LocalTalk. That is, if the Quadra is connected directly to a LocalTalk network, particularly one having third-party repeater-type devices, then it may have problems. If the Quadra is using the on-board Ethernet, it won't have this problem, even if its packets are routed to devices using LocalTalk connected elsewhere on the network.

Macintosh 12-Inch Monochrome Display: Description (Discontinued)

Revised: 6/7/94
Security: Everyone

Macintosh 12-Inch Monochrome Display: Description (Discontinued)

==========

Article Created: 26 May 1992

TOPIC ----------

This article describes the Macintosh 12-inch Monochrome Display.

DISCUSSION ----------

The Macintosh 12-Inch Monochrome Display is the lowest-cost high-resolution display for modular Macintosh computers. The combination of "page-white" phosphor screen and dark glass provides high brightness and sharp contrast. It displays up to 256 levels of gray simultaneously, depending on the Macintosh computer or video card.

Features

- 12-inch monochrome CRT
- 640 horizontal pixels by 480 vertical lines at 76 dots per inch (dpi)
- 67-hertz screen refresh rate
- "Page-white" phosphor screen and dark glass
- Antiglare screen
- Brightness and contrast controls

Benefits

- Sharp display of text and graphics on a full-size screen
- Superior resolution and focus for displaying small type and fine graphic details
- Full-width display (including margins) and more than half the height of a letter-size page
- Maintains close size integrity between the screen and printed documents.
- Reduces eyestrain by eliminating flicker.
- Improves brightness and contrast.
- Minimizes reflected glare.
- Lets you work comfortably in bright rooms.
- Lets you adjust the display to suit your preferences and environment.

If you're using a Macintosh IIsi, Macintosh IIci, or modular Macintosh personal computer equipped with an appropriate video card, you can display up to 256 shades of gray simultaneously. If you're using a Macintosh LC, you can display 16 shades of gray.

To use the Macintosh 12-inch Monochrome Display, you'll need the following:

- A Macintosh personal computer with a built-in video port or an appropriate video card, such as the Macintosh Display Card 4•8, the Macintosh Display Card 8•24, or the Macintosh Display Card 8•24 GC.
- A video cable, which is supplied with the display.

Apple Two-Page Monochrome Monitor: Description (Discontinued)

==========

Article Created: 26 May 1992

TOPIC ----------

This article describes the Apple Two-Page Monochrome Monitor.

DISCUSSION ----------

The Apple Two-Page Monochrome Monitor (M0402) is a high-quality, high-resolution, 21-inch monitor that can display two pages of text and graphics plus the Macintosh menus and scroll bars. This monitor is suited for page layout, desktop publishing, engineering and scientific applications, and higher education applications, especially for users of the A/UX operating system.

Features

- Active display area measures 15 inches horizontal by 11.3 inches vertical
- 1,152 by 870 pixel resolution at 77 dots per inch
- 75Hz refresh rate
- Flat antiglare screen

To enhance gray scaling, the Macintosh II Video Card Expansion Kit (M0213) is available as an option.

Apple Token Ring 4/16 NB Card: Description (3/94)

Revised: 3/18/94
Security: Everyone

Apple Token Ring 4/16 NB Card: Description (3/94)

==========

Article Created: 26 May 1992
Article Reviewed/Updated: 18 March 1994

TOPIC ----------

This article describes the Apple Token Ring 4/16 NB Card.

DISCUSSION ----------

The Apple Token Ring 4/16 NB Card is a 9-inch bus master network interface card. It allows Macintosh computers with NuBus expansion slots to connect to Token Ring networks that operate at either 4 or 16 megabits per second (Mbps). The card is based on the Macintosh Coprocessor Platform, and includes its own Motorola 68000 microprocessor, 512K of RAM, and A/ROSE, a real-time, multitasking operating system that runs on the card. The card operates independently of the main Macintosh processor, executing multiple networking protocols or network application programs concurrently. This maximizes both system and network performance.

The Token Ring 4/16 NB Card uses the IBM Token Ring chip set, ensuring compatibility and interoperability with all IBM Token Ring networks that operate at 4 or 16 Mbps. The card also supports a variety of software environments, including AppleTalk, 3270, and APPC. This flexibility provides users connected to Token Ring networks with access to both local area network (LAN) and mainframe-based services.

NOTE: The Apple Token Ring 4/16 NB Card is a 9-inch NuBus card and will not fit into Macintosh computers which take only 7-inch NuBus cards. These computers are: Centris and Quadra 610, 660AV, and Power Macintosh 6100/60.

Features

- Connection to IEEE 802.5 and 802.2 industry-standard Token Ring networks
- Software-switchable 4 and 16 Mbps speeds
- IBM Token Ring chip set; DB-9 connector formatting to IBM-type cabling
- Includes TokenTalk software

- Password-protected speed selection, timer settings, and locally administered address
- Multiprocessor, bus master architecture
- Motorola 68000 microprocessor
- 512K RAM, expandable to 2.5MB RAM
- Apple Real-time Multitasking Operating System Environment (A/ROSE)

Order Numbers

- Apple Token Ring 4/16 NB Card
  M0415LL/A
- Macintosh Coprocessor Platform Memory Expansion Kit
  M0145LL/A

Article Change History:
18 Mar 1994 - Updated to indicate that card is a 9-inch NuBus card.

Apple Token Ring 4/16 NB Card: Specifications (4/94)

==========

Article Created: 26 May 1992
Article Reviewed/Updated: 10 April 1994

TOPIC ----------

This article gives technical specifications for the Apple Token Ring 4/16 NB Card.

DISCUSSION ----------

Hardware

- Chip set: IBM Token Ring
- Connector: DB-9 connector for attaching to IBM Type 1 cabling. External adapters for Type 3 cabling are available from other vendors
- Processor: Motorola 68000 running at 10 Mhz
- Bus interface: 9-inch NuBus bus master
- Memory: 512K RAM, expandable to 2.5MB
- Power requirements: 1.5 amps at 5 volts
- Certification: FCC Class A; VDE
- Expansion memory: When increasing memory on the card, the following specifications must be met:
  - Type: Dynamic RAM
  - Size: 256K x 4 (for expanding to 1MB) or 1MB x 4 (for expanding to 2.5MB)
  - Configuration: 4 bits wide
  - Package: ZIP
  - Speed: 120 ns or faster

To expand the Token Ring 4/16 NB Card memory to 1MB, order the Macintosh Coprocessor Platform Memory Expansion Kit.

To expand the Token Ring 4/16 NB Card memory to 2.5MB, contact:

- Andrew Corporation in Austin, TX. Telephone number is 512-314-3000

Software

- Application interface: AppleTalk, Apple 3270 API, APPC verb interface
- LLC implementation: Type 1 and Type 2
- Routing: Supports IBM source routing

Software-Configurable Card Settings

- Transmission speed: 4 or 16 megabits per second
- Token Ring address: burned-in or locally administered address
- Timers: Response (T1), Acknowledge (T2), and Inactivity (Ti)
- Card settings can be password-protected

Token Ring Cabling Specifications

- Shielded twisted-pair (IBM Type 1 cabling)
  - Maximum distance from multistation access unit (MAU) to device (lobe length) = 300 meters
  - Maximum distance between two MAUs (trunk length) = 200 meters
  - Maximum devices per ring = 260
- Unshielded twisted-pair (IBM Type 3 cabling)
  - Maximum distance from MAU to device (lobe length) = 100 meters
  - Maximum distance between two MAUs (trunk length) = 120 meters
  - Maximum devices per ring = 72

For further information on third party products, please use the vendor name as a search string.

Article Change History:
10 April 194 - Updated information on where to get Memory upgrades.
18 Mar 1994 - Updated information to include this is a 9-inch Nubus card.
23 Sep 1992 - Updated by adding another third-party source of RAM SIMMs to upgrade the card.

Apple 3.5 Drive: Description

==========

Article Created: 26 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Apple 3.5 Drive.

DISCUSSION ----------

The Apple 3.5 Drive adds 800K of data storage to the Apple IIGS, Macintosh 512K, Macintosh 512K Enhanced, Macintosh Plus, and Macintosh SE personal computers. The Apple 3.5 Drive uses 3.5-inch, 800K, double-sided disks.

Features

- Over 5 times the storage capacity of 5.25-inch drives.
- Daisy-chaining capability (for Apple IIGS only). An additional port on the back of the unit allows you to connect another Apple 3.5 Drive or Apple 5.25 Drive directly. Up to three extra drives can be daisy-chained for a total of 3.2MB of external storage. (3.5 drives must come first in the chain.)
- In-use light that indicates when the drive is running.
- Direct connection to the Apple IIGS without an interface card.
- Platinum finish that matches the Apple IIGS, Macintosh Plus and Macintosh SE.

Benefits

- Multiple programs and increased data can be stored on a single disk; disk swapping is reduced.
- All ProDOS- or Pascal-based Apple II software can be run on 3.5-inch media.
- Users can load programs and retrieve data faster.
- For the Apple IIGS only, the Apple 3.5 Drive provides flexibility by

allowing connection of up to three extra drives (3.5-inch or 5.25-inch) to the first drive; users can mix a 3.5-inch and 5.25-inch drive in the same system. (3.5 drives must come first in the chain.)

Apple Keyboard II: Description (Discontinued 6/94)

==========

Article Created: 26 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

This article describes the Apple Keyboard II.

DISCUSSION -----

Key Layout

Key location on the Apple Keyboard II differs from the earlier Apple Keyboard:
- The caps lock and control key exchanged places.
- The tilde key is where the escape key was.
- The vertical line key was moved to a new location above the new return key.
- The escape key took the vertical line's old spot.
- The return key was made smaller.
- The space bar was enlarged.

The international ISO version has a new key with ± and § characters and the escape key replaced the right-hand side command key.

Both keyboards' numeric keypads have the + and - keys reversed. It is the same as the extended keyboard. In addition, this is the same arrangement as a 10-key adding machine.

With the exception of the arrow and escape keys, Apple Keyboard II has a layout which is identical to the comparable parts of the Apple Extended Keyboard II.

Tilt Legs

At the ends on the back, the keyboard has two legs the user can extend to provide a greater tilt.

Compliance

The Apple Keyboard II is fully ANSI and ISO compliant.

TOPIC ----------

This article describes the AppleColor Composite Monitor IIe.

DISCUSSION ----------

The AppleColor Composite Monitor IIe allows users to add color capabilities to their Apple IIe systems.

Features

- Displays high-resolution color graphics, 80-column text in monochrome, or color graphics with text in a 40-column format.

- Can work with composite (NTSC) video output instead of RGB output, so users simply plug the monitor into the video jack of their Apple IIe, Apple II Plus, Apple II, or Apple IIc computer. No need for special cards or adaptors.

- The 13-inch screen provides a large display area for easy viewing.

The monitor provides higher resolution than standard video or television screens. It provides a cost-effective solution for users who require color display and 80-column text, and is compatible with all Apple software.

Apple Ethernet LC Card: Description (Discontinued)

==========

Article Created: 26 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Apple Ethernet LC Card.

DISCUSSION ----------

The Apple Ethernet LC Card is a network interface card for the Macintosh LC personal computer.

The Apple Ethernet LC Card and the Apple Ethernet Thin Coax Transceiver provide a high-performance (10 megabits per second) network option that is easier to install and configure than traditional Ethernet systems.

The Ethernet LC Card, Apple Ethernet Thin Coax Transceiver, and 2-meter thin coaxial cable (included with the Transceiver) are all you need to connect Macintosh LC computers together on an Ethernet network. The Ethernet Thin Coax Transceiver is self-terminating.

Apple Ethernet media adapters are available to integrate the Ethernet LC Card into twisted-pair and thick coaxial cable Ethernet environments.

Features

- Apple Ethernet Cable System compatibility
- Includes EtherTalk software
- Compliance with IEEE 802.3 standards

Benefits

- Provides plug-and-play networking for the Macintosh LC computer. Allows the Macintosh LC computer to connect to any Ethernet cabling environment.

- Provides AppleTalk network system users with a higher-performance connection to network services.
- Allows Macintosh LC computers to connect to industry-standard Ethernet networks and interoperate in multivendor Ethernet environments.

Apple Ethernet LC Card: Specifications

Revised: 6/26/92
Security: Everyone

Apple Ethernet LC Card: Specifications

==========

Article Created: 26 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

This article gives technical specifications for the Apple Ethernet LC Card.

DISCUSSION -----

The Apple Ethernet LC Card provides physical and link level access to data communications networks meeting IEEE 802.3 and 802.2 Logical Link Control (LLC) type 1 standards.

Connector

• Apple Ethernet

Transmit/Receive Data Rate

• 10-megabits-per-second maximum data rate

Power Dissipation
• < 4 watts

Environmental Requirements

• Operating temperature
  50 to 104 degrees F (10 to 40 C)

• Humidity
  20% to 95% noncondensing at a temperature range of 25 to 40 degrees C

Ethernet Controller

- National Semiconductor DP83932 (SONIC)

System Requirements

- Macintosh LC
  In addition to the Apple Ethernet LC Card and accompanying software, the following are required to connect a Macintosh LC personal computer to an Ethernet network:
  - The Macintosh Operating System.
  - If you're using AppleTalk network services, the network must use AppleTalk Phase 2 protocols.
  - An Apple Ethernet Cable System external transceiver or AUI adapter.

- Apple Ethernet Thin Coax Transceiver
  The Apple Ethernet Thin Coax Transceiver provides plug-and-play networking in a high-performance Ethernet environment. The Ethernet LC Card, the Apple Ethernet Thin Coax Transceiver, and the 2-meter segment of thin coaxial cable included with the Transceiver are all you need to connect a Macintosh LC computer to an Ethernet network. You need no terminators or other Ethernet hardware.

  The Apple Ethernet Self-Terminating Cable -- 5 Meter and Apple Ethernet Self-Terminating Cable -- 13-Meter Plenum, or other RG 58 A/U thin coaxial cable, can be used to connect devices that are more than 2 meters apart.

- Apple Ethernet Twisted-Pair Transceiver The Apple Ethernet Twisted-Pair Transceiver is used to connect the Ethernet LC Card to an Ethernet network using unshielded twisted-pair cable.

  To use Ethernet with unshielded twisted-pair media, you need an IEEE 802.3 10BASE-T-compatible hub, sold separately from third-party vendors.

- Apple Ethernet AUI Adapter
  The Apple Ethernet AUI Adapter provides the Ethernet LC Card with a standard IEEE 802.3 Attachment Unit Interface (AUI). The AUI can be used to connect the Ethernet LC Card to an external transceiver.

Apple Ethernet NB Card: Description (Discontinued)

Revised: 6/7/94
Security: Everyone

Apple Ethernet NB Card: Description (Discontinued)

==========

Article Created: 26 May 1992

TOPIC ----------

This article describes the Apple Ethernet NB Card.

DISCUSSION ----------

The Apple Ethernet NB Card is a bus master network interface card that provides connectivity to IEEE 802.3 Ethernet networks for the Macintosh II family of personal computers.

The Ethernet NB Card has its own 68000 microprocessor, memory, and real-time multitasking operating system. Operating independently of the main Macintosh processor, the card supports the concurrent execution of multiple networking protocols while maximizing both system and network performance.

The Ethernet NB Card includes an Apple Ethernet port. With the addition of the appropriate Apple Ethernet Cable System media adapter, which plugs into the port, Ethernet NB Card users can connect to any standard Ethernet cabling environment:

- Thin coax
- Thick coax
- Unshielded twisted-pair

Because all Apple Ethernet Cable System components are IEEE 802.3 compliant, they can interoperate in multivendor environments.

This easy-to-install card lets you use a variety of networking protocols with a Macintosh computer, including AppleTalk, TCP/IP, and DECnet.

Features

- Compliance with IEEE 802.3 standards
- Apple Ethernet Cable System compatibility
- Includes EtherTalk software
- A/UX local area networking support

Benefits

- Allows the Macintosh II family of computers to connect to industry-standard Ethernet networks and interoperate in multivendor Ethernet environments.
- Can be used in any standard Ethernet cable environment with the appropriate Apple Ethernet media adapter.
- Provides AppleTalk network system users with transparent access to network services.
- When used with the A/UX operating system from Apple, provides a complete solution for connecting to local area network environments based on the UNIX operating system, including TCP/IP and the Network File System (NFS).
- Handles all communications processing for the Macintosh II family of computers. Allows concurrent execution of multiple networking protocols. Optimizes system and network performance.

ImageWriter II: Description

==========

Article Created: 26 May 1992

TOPIC ----------

This article describes the ImageWriter II printer.

DISCUSSION ----------

The ImageWriter II printer is an entry-level, dot-matrix printer. It offers fast drafts, sharp graphics, near-letter-quality output, easy paper handling, and color printing.

Features

- Three printing speeds
  - Fast draft
  - Mid-speed correspondence mode
  - Near-letter-quality mode
- Color printing in six colors with one change of ribbon
- Printing on cut-sheet or continuous paper, including labels
- Push-button paper loading for single sheets

The ImageWriter II can be expanded by these options:

- Sheet feeder option
- 32K Memory option increases buffer space so that you can use Apple IIe, IIc, or IIGS computer while the ImageWriter II prints
- LocalTalk option allows sharing the printer on any AppleTalk network.

The mini circular-8 connector and cable, available as a separate item, connects the ImageWriter II to Apple CPUs. The Apple II, II Plus, and IIe require a Super Serial Card to connect with an ImageWriter II.
The ImageWriter II color printing feature requires an ImageWriter II Color Ribbon and color-compatible software.

Article Last Updated:

TOPIC ----------

This article describes the LaserWriter IINT.

DISCUSSION ----------

The LaserWriter IINT is Apple's mainstream network laser printer, ideal for producing sophisticated text and graphics. The LaserWriter IINT features a 68000 microprocessor, providing fast 300 dpi output. It also offers 2MB of RAM and 1MB of ROM, allowing you to store a wide variety of fonts. Eleven font families (35 typefaces) are included with the LaserWriter IINT.

The LaserWriter IINT features built-in support for the AppleTalk Personal Network, allowing up to 31 users to share the printer. The LaserWriter IINT works with any software that outputs PostScript-compatible files, offering unlimited flexibility in creating and manipulating text and graphics.

An RS-232 port provides easy connection to MS-DOS computers. The LaserWriter IINT supports the Diablo 630 Emulation Mode. MS-DOS users can access the printer by purchasing an AppleTalk PC Card or the appropriate RS-232 cable.

The LaserWriter IINT is compatible with Macintosh Plus, Macintosh SE, Macintosh II, and Apple IIGS, as well as the Apple LaserShare Print Spooler.

TOPIC -----

This article describes the LaserWriter IINTX.

DISCUSSION -----

The LaserWriter IINTX is a high-performance expandable network laser printer for individuals and workgroups.

The first laser printer from Apple to feature a 68020 microprocessor running at 16 Mhz, the LaserWriter IINTX prints significantly faster than previous LaserWriters. The LaserWriter IINTX is configured with 2MB of RAM and 1MB of ROM. Eleven font families (35 typefaces) are included with the LaserWriter IINTX.

The LaserWriter IINTX features several expansion options -- up to 12MB of RAM. When expanded, its capacity for downloading typeface fonts is increased and page processing and printing is even faster. An external SCSI port lets users connect up to seven external hard disks for the storage of additional fonts. Font expansion cards, to be offered by third parties, can be installed directly in a single slot in the controller board, increasing the number of high-speed ROM-resident fonts in the printer.

The LaserWriter IINTX features built-in support for the AppleTalk Personal Network and works with any software that outputs PostScript-compatible files.

An RS-232 port provides easy connection to MS-DOS computers. The LaserWriter IINTX support the Diablo 630 Emulation Mode and LaserJet Plus Emulation Mode. MS-DOS users can access the printer by purchasing an

AppleTalk PC Card or the appropriate RS-232 cable.

The LaserWriter IINTX is compatible with the Macintosh Plus, Macintosh SE, Macintosh II, and Apple IIGS, as well as the Apple LaserShare Print Spooler.

Article Last Updated:

TOPIC ----------

This article describes the LaserWriter IISC.

DISCUSSION ----------

The LaserWriter IISC is Apple's entry-level, single-user laser printer. It brings the individual Macintosh user full-page, high-resolution text and graphics.

The LaserWriter IISC features a 68000 microprocessor providing high-speed performance. A SCSI interface provides high-speed data transfer for faster printing.

Because it relies on QuickDraw in the Macintosh -- instead of PostScript -- to process documents, there are no fonts resident in the LaserWriter IISC.

The LaserWriter IISC is compatible with the Macintosh Plus, Macintosh SE, and Macintosh II computers, and connects through a SCSI port.

This article describes the LaserWriter Plus.

DISCUSSION ----------

The LaserWriter Plus has all the features and power of the LaserWriter, with seven additional typeface families including ITC Avant Garde, ITC Bookman, Helvetica Narrow, New Century Schoolbook, Palatino, ITC Zapf Dingbats and ITC Zapf Chancery. The LaserWriter Plus has one full megabyte of ROM (one-half megabyte more than the LaserWriter). The LaserWriter Plus is available as a pre-assembled package.

The LaserWriter Plus Kit enables users to upgrade a LaserWriter into a LaserWriter Plus. Here are the kit components:

- Sixteen 512K ROM chips contain 11 built-in type families
- A Printer Installation Disk with print drivers for the LaserWriter (All LaserWriter users' systems must be updated with the Printer Installation Disk.)
- A Fonts Disk which includes a copy of the Font/DA Mover and the screen fonts for all printer fonts shipped in the LaserWriter Plus Kit
- A revised LaserWriter Manual, describing all the new software features
- A Dealer Instruction Sheet, return mailer with label, and return form
- A LaserWriter Plus label to affix to the outside of the LaserWriter after the ROMs have been installed

Macintosh 12-Inch RGB Display: Specifications (Discontinued)

==========

Article Created: 26 May 1992

TOPIC ----------

This article gives technical specifications for the Macintosh 12-inch RGB Display.

DISCUSSION ----------

Picture Tube

- 12-inch (30.5 cm) diagonal
- Phosphor EIA Type P22 (aluminized)
- High-contrast antiglare (international versions only)
- Shadow mask

Input Signal

- Video: RS-343 standard
- Sync: Separate sync, negative going, TTL

User Controls

- Power Switch (back panel)
- Brightness, with detent reference (right side)
- Contrast (right side)

Scanning Frequencies

- Horizontal 24.48 kHz
- Vertical 60.15 Hz
- Dot Clock 30.24 MHz

Resolution

- 512 (H) dots by 384 (V) lines - Macintosh II

• 560 (H) dots by 384 (V) lines - Mac LC with Apple IIe Card

Active Video Display Area

Adjusted at the factory to produce an active video area of 8.08-inch (205 mm) horizontal by 6.02-inch (153 mm) vertical. The remainder of the screen is used for the dark border around the display.

Size

• Height: 12.2 inches (31.0 cm)
• Width: 14.4 inches (36.5 cm)
• Depth: 10.2 inches (25.9 cm)
• Weight: 24 lbs (10.8 kg)

Power Requirements

• 90 watts maximum

Input Voltage

• Operating range 100 to 120 volts
• Frequency   50-60 Hz

Environmental

• Operating Ambient Temperature 50 to 104 degrees F (10 to 40 degrees C)
• Operating Humidity 95% maximum, non-condensing
• Operating Altitude 10,000 feet (3,000m) maximum

Fuse Protection

The monitor contains internal power line fuse protection. This fuse should be replaced with the same type by a qualified service technician.

Article Last Updated:

TOPIC ----------

This article describes the Personal LaserWriter LS.

DISCUSSION ----------

The Apple Personal LaserWriter LS offers text and graphics printing, versatility, and ease of use. It's designed for individual use. It is compact to fit on any desktop, and you don't need to purchase additional cabling, interface cards, or software drivers.

A built-in multipurpose tray holds different sizes of paper and envelopes, as well as labels. With optional cassettes you can print automatically up to 250 sheets of letter- or legal-size paper or 15 envelopes.

You have the flexibility of printing high-quality text in a wide range of styles in any size you like. The personal LaserWriter LS comes with 39 TrueType fonts, including Times, Helvetica, Palatino, ITC Avant Garde Gothic, and Symbol. You can use TrueType fonts available from other suppliers, including text and headline fonts, symbol fonts for special purposes, display fonts, and novelty fonts for decoration.

Features

- Print Quality
  - 300-dot-per-inch (dpi) resolution for high-quality text and graphics
  - 39 TrueType fonts for printing a wide range of styles in any size

- Affordability
  - Complete, ready-to-use printer; no additional cabling, interface cards, or software drivers necessary

    - Outstanding durability and nearly maintenance-free performance

- Flexibility
    - Built-in multipurpose tray for print materials used most commonly, including letter- and legal-size paper, and envelopes
    - Optional cassettes for 250 sheets of paper or 15 envelopes

Personal LaserWriter NT: Description (Discontinued)

==========

Article Created: 26 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Personal LaserWriter NT.

DISCUSSION ----------

The Apple Personal LaserWriter NT printer features a compact, space-saving design and offers affordable high-quality laser printing. It has an integral paper cassette as well as a multipurpose tray that can handle different printing materials and paper sizes automatically.

Features

- 300 dot-per-inch resolution which produces near-typeset quality text, graphics and scanned images.
- Motorola 68000 processor, which supports printing up to 4 pages per minute.
- Canon LBP-LX laser xerographic print engine which offers durability and nearly maintenance-free performance. It provides a minimum performance life of 150,000 pages (equivalent to printing 100 pages/day, 5 days/week, 52 weeks/year for 5 years).
- PostScript support, which offers virtually unlimited versatility in creating and manipulating text and graphics. You can print documents from nearly all Macintosh applications, some Apple IIGS programs, MS-DOS and OS/2 applications, and, using additional software, AT&T UNIX programs.
- AppleTalk Network System Interface, which offers cost-effective printing by allowing multiple user access. This interface also allows printing from Macintosh, Apple IIGS, MS-DOS, or OS/2 computers (using the LocalTalk PC card).
- HP LaserJet Plus and Diablo emulations, which allow anyone whose computer

supports an RS-232-C interface to print documents similar to the way they print documents on HP LaserJet Plus or Diablo 630 printer.
- 37 built-in fonts let you print documents in virtually any type size and a wide range of styles.
- Support for different printing materials which lets you print on a variety of media, such as overhead transparency film, photocopy bond, and so on.
- Integral paper cassette provides automatic feeding of up to 250 sheets of paper.
- Multipurpose tray simplifies printing on different paper sizes, envelopes, or labels.
- Optional envelope cassette lets you print up to 15 envelopes automatically.
- Background printing lets you continue to work on your Macintosh computer while you print.

Personal LaserWriter NT: Specifications (Discontinued)

==========

Article Created: 26 May 1992

TOPIC ----------

This article gives technical specifications for the Personal LaserWriter NT.

DISCUSSION ----------

Marking Engine

• Canon LBP-LX laser xerographic

Controller

• The LaserWriter controller hardware contains a 12MHz 68000 CPU, 1.25MB of ROM, 2MB of RAM, LocalTalk interface, and RS-232-C serial interface

Print Quality

• 300 dots per inch for text and graphics

Built-in Font Families

• ITC Avant Garde Gothic, ITC Bookman, Courier, Helvetica, Helvetica Narrow, New Century Schoolbook, Palatino, Symbol, Times, ITC Zapf Chancery, ITC Zapf Dingbats, and IBM PC Graphics Extended Character Set (ECS)

Support for Additional Fonts

• Any PostScript font from a variety of suppliers

Speed

• Four pages per minute maximum (actual speed depends on the images printed)

Interfaces

- LocalTalk, RS-232-C, and RS-422

Printing Protocols

- PostScript, HP LaserJet Plus, and a subset of the Diablo 630 command set

Recommended Duty Cycle

- Toner cartridge: 3,500 pages
- Printer: minimum 150,000 pages, with no monthly page limit

Paper Feed

- Input
  - Automatic with paper cassette
  - Automatic or manual with multipurpose tray
- Output
  - Face down or face up options

Print Materials

- Media: Apple recommends 20-lb. photocopy or typewriter bond (75 g/m^2), though the printer also accepts 16-lb. (60 g/m^2) to 28-lb. (105 t/m^2) paper. For best results, use envelopes that are recommended for laser printers.
- Sizes
  - Paper: U.S. letter, U.S. legal, A4, B5 (Japanese Industry Standard)
  - Envelopes: minimum 3.5 x 7 inches (86 x 178mm); maximum 7.4 x 10.5 inches (188 x 267mm)

Paper Capacities

- Paper cassette: 250 sheets of 20-lb. (75 g/m^2) paper
- Multipurpose tray: up to 50 sheets of paper or 5 envelopes
- Optional envelope cassette: 15 envelopes (To print envelopes, you can use the multipurpose tray with automatic or manual feed, or the optional envelope cassette. To print labels, use the multipurpose tray using manual feed.)

Printable Surface

- Maximum printable line: 8.1 inches (205.9mm)
- Minimum top and bottom margins: 0.235 inches (6.0mm)
- Minimum left margin: 0.197 inches (5.0mm)
- Minimum right margin: 0.197 inches (5.0mm)
  (The actual printable area may vary depending on the application.)

Emulation

- HP LaserJet Plus and Diablo 630

Size and Weight

- Height: 9.8 inches (24.8cm)
- Width: 15 inches (38cm)
- Depth with letter-size cassette: 18.3 inches (46.4 cm)
- Weight: 32 lb. (15 kg)

Operating Environment

- Temperature: 50 to 90 F (10 to 32 C)
- Humidity: 20 to 80 percent
- Toner cartridge transit environment:
  -4 degrees F to +104 degrees F (-20 degrees C to +40 degrees C)

Power Requirements

- U.S./Japan: 100 to 115 volts AC, 50 to 60 hertz
- Europe/Australia: 220 to 240 volts AC, 50 to 60 hertz

Power Consumption

- 600 watts maximum at 115 volts
- 550 watts maximum at 220 volts

System Requirements

To use the Personal LaserWriter NT, you'll need one of these systems:

- One or more Macintosh (minimum 512K of RAM) or Apple IIGS computers connected via the LocalTalk cabling system
- One or more Apple IIe computers equipped with an Apple II Workstation Card and connected via the LocalTalk cabling system
- An MS-DOS or OS/2 computer with a LocalTalk PC Card or an RS-232-C cable and appropriate software
- Any other computer with an RS-232-C cable and appropriate software

Personal LaserWriter SC: Description (Discontinued)

==========

Article Created: 26 May 1992
Article Reviewed/Updated: 21 September 1995

TOPIC ----------

This article describes the Personal LaserWriter SC.

DISCUSSION ----------

The Apple Personal LaserWriter SC printer is compact enough to fit on a desktop, offers improved paper handling, and comes with a selection of fonts in six sizes. It has one paper cassette that can handle 250 sheets and a second multipurpose tray that can handle different printing materials and paper sizes automatically. The Personal LaserWriter SC can be upgraded to a Personal LaserWriter NT by having the controller board replaced by an authorized Apple dealer.

Features

- 300 dot-per-inch resolution, which produces near-typeset quality text, graphics and scanned images.
- Motorola 68000 processor, which supports printing of up to 4 pages per minute.
- Canon LBP-LX laser xerographic print engine, which offers durability and nearly maintenance-free performance. It provides a minimum performance life of 150,000 pages (equivalent to printing 100 pages/day, 5 days/week, 52 weeks/year for 5 years).
- A variety of Macintosh typefaces and type sizes: Times, Helvetica, Courier and Symbol.
- Support for different printing materials, which lets you print on a variety of media such as overhead transparency film, photocopy bond, and so on.
- Integral paper cassette provides automatic feeding of up to 250 sheets of paper.
- Multipurpose tray simplifies printing on different paper sizes, envelopes, or labels.

- Optional envelope cassette lets you print up to 15 envelopes automatically.
- Background printing lets you continue to work on your Macintosh computer while you print.
- Upgrade path protects your investment by letting you upgrade to the Personal LaserWriter NT through replacement of the controller board.

System Requirements

- Macintosh computer with the Personal LaserWriter SC driver.

Personal LaserWriter SC: Specifications (Discontinued)

Revised: 9/27/93
Security: Everyone

Personal LaserWriter SC: Specifications (Discontinued)

==========

Article Created: 26 May 1992

TOPIC ----------

This article gives technical specifications for the Personal LaserWriter SC.

DISCUSSION ----------

Marking Engine

- Canon LBP-LX laser Xerographic

Controller

- The LaserWriter controller hardware contains an 8MHz 68000 CPU, 64 kilobytes of ROM, 1MB of RAM, and SCSI interface.

Print Quality

- 300 dots per inch for text and graphics

Macintosh Fonts (On Disk)

- Courier, Helvetica, Symbol, and Times in 9-, 10-, 12-, 14-, 18-, and 24-point sizes, with their corresponding 4 x fonts (36-point, 40-point, 48-point, 56-point, 40-point, 48-point, 56-point, 72-point, and 96-point)
- Font styles: plain, bold, italic, and bold italic, with additional styles depending on the application. (For best results, these fonts should be installed in the System file in your Macintosh computer from the disks shipped with the Personal LaserWriter SC.)

Support for Additional Fonts

- The Personal LaserWriter SC can support additional fonts from Apple and from other suppliers. For best results, install two sizes for each font:

One should be the point size you want to work with on the screen, and the other should be four times that size for the printer to use.

Speed

- Four pages per minute maximum (actual speed depends on the images printed)

Interface

- SCSI (Small Computer System Interface)

Recommended Duty Cycle

- Toner cartridge: 3,500 pages
- Printer: minimum 150,000 pages, with no monthly page limit

Paper Feed

- Input
  - Automatic paper cassette
  - Automatic or manual with multipurpose tray
- Output
  - Face down or face up options

Print Materials

- Apple recommends 20-lb. photocopy or typewriter bond (75 g/m^2), though the printer also accepts 16-lb. (60 g/m^2) to 28-lb. (105 g/m^2) paper. For best results, use envelopes that are recommended for laser printers.
- Sizes
  - Paper: U.S. letter, U.S. legal, A4, B5 (Japanese Industry Standard)
  - Envelopes: minimum 3.5 x 7 inches (86 x 178mm); maximum 7.4 x 10.5 inches (188 x 267 mm)

Paper Capacities

- Paper cassette: 250 sheets of 20-lb. (75 g/m^2) paper
- Multipurpose tray: up to 50 sheets of paper or 5 envelopes
- Optional envelope cassette: 15 envelopes (To print envelopes, you can use the multipurpose tray with automatic or manual feed. To print labels, use the multipurpose tray using manual feed.)

Printable Surface

- Maximum printable line: 8.1 inches (205.9mm)
- Minimum top and bottom margins: 0.235 inches (6.0mm)
- Minimum left margin: 0.197 inches (5.0mm)
- Minimum right margin: 0.197 inches (5.0mm)
  (The actual printable area may vary depending on the application.)

Size and Weight

- Height: 9.8 inches (24.8cm)
- Width: 15 inches (38cm)
- Depth with letter-size cassette: 18.3 inches (46.4cm)
- Weight: 32 lb. (15 kg)

Operating Environment

- Temperature: 50 to 90 F (10 to 32 C)
- Humidity: 20 to 80 percent
- Toner cartridge transit environment: -4 to +104 F (-20 to +40 C)

Power Requirements

- U.S./Japan: 100 to 115 volts AC, 50 to 60 hertz
- Europe/Australia: 220 to 240 volts AC, 50 to 60 hertz

Power Consumption

- 600 watts maximum at 115 volts
- 550 watts maximum at 220 volts

System Requirements

- To use the Personal LaserWriter SC, you'll need a Macintosh personal computer with the Personal LaserWriter SC driver.

Apple Serial NB Card: Specifications

Revised: 6/8/92
Security: Everyone

Apple Serial NB Card: Specifications

==========

Article Created: 26 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

This article gives technical specifications for the Apple Serial NB Card.

DISCUSSION -----

Connector

- DB-62 connector for multiple-port connectivity (cable available separately from Apple Computer)

Interface

- NuBus plugs into any computer in the Macintosh II family

Processor

- Motorola 68000 running at 10 megahertz

Memory

- 512K of RAM, expandable to 1MB

Power Dissipation

- 10 watts

Transmit/Receive Data Rates

- 19.2 kilobits per second

• 64 kilobits per second using the specified IMA-backed ports

System Requirements

To use the Apple Serial NB Card, you'll need:

• A computer system in the Macintosh II family
• Macintosh system software version 6.0.3 (or later)

Apple StyleWriter: Description (Discontinued)

Revised: 6/7/94
Security: Everyone

Apple StyleWriter: Description (Discontinued)

==========

Article Created: 26 May 1992

TOPIC ----------

This article describes the Apple StyleWriter printer.

DISCUSSION ----------

The Apple StyleWriter printer is designed for individual use, providing near-laser-quality print at 360 dots per inch (dpi) while using thermal ink-jet technology. The Image utility allows conversion of 300 dpi halftone images (PICT format) for printing at 360 dpi, which is the maximum resolution of the StyleWriter printer. The StyleWriter works with any Macintosh and is an ideal companion for the Macintosh Classic, the Macintosh LC, and Macintosh IIsi personal computers. This printer offers a printing alternative for users sharing a networked Apple LaserWriter printer.

No additional cables, memory, or interface cards are needed to use the StyleWriter. The detachable sheet feeder automatically feeds up to 50 sheets. This printer can be used without the sheet feeder with front and rear manual feed options. The front and rear manual feed options simplify the printing of single sheet paper, envelopes, labels, or transparencies. The user replaceable ink cartridge prints up to 500 pages of text and graphics.

Apple's TrueType advanced font technology is incorporated into the package with Times, Helvetica, Courier, and Symbol font designs standard with each StyleWriter. Additional compatible TrueType fonts are available from other suppliers, including headline, text, symbol, and novelty designs. TrueType, in conjunction with the Apple StyleWriter, allows for production of documents containing equations and formulas. Virtually any type size and a wide range of styles can be used.

System Requirements

• Macintosh personal computer with at least 1MB RAM

- System software 6.0.7 or later

Order Number

StyleWriter B0438LL/C

Apple SuperDrive, External: Description (Discontinued)

Revised: 6/7/94
Security: Everyone

Apple SuperDrive, External: Description (Discontinued)

==========

Article Created: 26 May 1992

TOPIC ----------

This article describes the Apple External SuperDrive.

DISCUSSION ----------

The Apple SuperDrive is a floppy disk drive that offers high-capacity storage to owners of Macintosh and Apple II personal computers. Because it uses high-density, double-sided 3.5-inch floppy disks, the Apple SuperDrive gives you access to almost twice the storage capacity of standard 800K disk drives.

The Apple SuperDrive used with a Macintosh computer makes it possible for you to exchange information between Macintosh and MS-DOS, OS/2, and ProDOS systems. Using the Apple File Exchange utility or third-party translators, the Apple SuperDrive works with files stored in many different formats. For example, it can read from and write to Macintosh 400K disks, Apple II and Macintosh 800K and 1.4MB disks, as well as MS-DOS and OS/2 720K and 1.4MB disks.

The disk drive also comes with a high-density disk detector that allows the drive to automatically format to the correct disk capacity (800K or 1.4MB). It plugs directly into the floppy drive port on the back panel of most Macintosh systems or the connector in the back of the Apple II 3.5 Controller Card.

Features

- Capacity
  - 1.4MB of storage for most Macintosh and Apple II computers -- almost twice the capacity available from 800K disks
  - 800K of storage for Macintosh Plus and Apple IIc Plus computers, as well as Apple IIGS computers that aren't equipped with the Apple II 3.5

Controller Card
- Flexibility
  - Can read from and write to 400K, 800K, and 1.4MB disks on a Macintosh computer and 800K and 1.4MB disks on an Apple II computer.
  - Allows you to work on your Macintosh with files stored on MS-DOS, OS/2, or ProDOS disks using the Apple File Exchange utility or third-party translators
- Ease of Use
  - Plug-and-play simplicity with any Macintosh or Apple II computer
  - Automatic formatting to correct disk capacity

Apple SuperDrive (External): Specifications (Discontinued)

==========

Article Created: 26 May 1992

TOPIC

This article gives technical specifications for the Apple External SuperDrive.

DISCUSSION

Recording Media
- Disk diameter: 3.5 inches
- Recording surfaces: 2
- Number of cylinders: 80

Capacity
- Formatted data: 1.416MB
- Unformatted data: 2.0MB

Drive Characteristics
- Seek time (track-to-track): 6 milliseconds maximum
- Settle time: 30 milliseconds maximum
- Data transfer rates: 500 kilobits per second
- Drive startup time: 600 milliseconds maximum

Interface
- Apple proprietary interface

Electrical Requirements
- +12 volts
  - Typical: 185 milliamps
  - Peak: 600 milliamps
- +5 volts
  - Standby: 20 milliamps
  - Typical: 220 milliamps

Operating Environment
- Temperature: 50 to 104 degrees F (10 to 40 degrees C)
- Relative humidity: 5% to 90% noncondensing

System Requirements
- Any Macintosh Classic or Classic II, Macintosh SE (with upgraded ROMs to support an internal SuperDrive), Macintosh IIcx, Macintosh IIci, or Macintosh IIsi personal computer
- Any Apple IIGS, Apple IIc Plus, or Apple IIe personal computer with the Apple II 3.5 Controller Card

Size and Weight
- Height: 2.01 inches (51 mm)
- Width: 4.72 inches (120 mm)
- Depth: 7.87 inches (200 mm)
- Weight: 2.8 lb. (1.3 kg)

AppleColor High-Res. RGB Monitor (13"): Descr. (Discontinued)

==========

Article Created: 26 May 1992

TOPIC ----------

This article describes the AppleColor High-Resolution RGB Monitor (13-inch).

DISCUSSION ----------

The AppleColor High-Resolution RGB Monitor is a high resolution color display for the Macintosh.

Features

- 640 x 480 pixel resolution and analog input format.
- A 13-inch Trinitron CRT that allows users to display information in either color or black and white (with a resolution of 69 DPI).
- With the Macintosh II Video Card, the AppleColor High-Resolution RGB Monitor can display 16 colors or gray scales simultaneously from a palette of 16 million, or 256 colors or gray scales simultaneously with Macintosh II Video Card Expansion Kit.

TOPIC -----

This article describes the AppleColor RGB Monitor.

DISCUSSION -----

The AppleColor RGB Monitor simultaneously displays high-resolution text color graphics for the Apple IIGS.

Features

- A 12-inch screen.
- High-resolution analog RGB color.
- Direct connection to the RGB port of the Apple IIGS; the connector cable is supplied and no adaptor or interface card is necessary.
- Display of all 4,096 colors generated by the Apple IIGS; 256 colors can be displayed at one time.
- Crisp 80-column text as well as graphics, eliminating the need for separate monitors for your applications.
- Platinum finish that matches the Apple IIGS.

Benefits

- Presentation of a full range of colors in a sharp, true image.
- Presentation of color text and graphics clearly at the same time.
- Easy installation; no interface card is required.
- A complete color solution for Apple IIGS.

Order Number

- AppleColor RGB Monitor

DISCUSSION ----------

Picture Tube

- 14-inch diagonal (13-inch view)
- 0.52 mm slot pitch
- High contrast (black matrix)

Input Signal

- Composite-only sync negative 1.0 +- 0.5 volts peak to peak, internally terminated with 75 ohm resistor

User Controls

- Front power switch
- Contrast
- Brightness
- Color
- Tint
- White Only button
- Vertical height (back)
- Vertical hold (back)
- Horizontal hold (back)

Scanning Frequencies

- Horizontal
  - 15.734 kHz NTSC/60
  - 15.659 kHz NTSC/50
- Vertical
  - 60 Hz NTSC/60
  - 50 Hz NTSC/50

Color Reference Frequency

- 3.579545 MHz NTSC/60
- 3.562456 MHz NTSC/50

Video Bandwidth

- Text (Monochrome) 8.0 MHz NTSC
- Graphics (Color) 3.0 MHz NTSC

Weight

- 12.5 kg (27.56 lbs) maximum

Power Requirement

- 50 watts under normal viewing conditions; 75 watts maximum

Input Voltage

- 120 v Model: 108-132 operating range, 50-60 Hz power frequency
- 220 v Model: 198-242 operating range, 50-60 Hz power frequency
- 240 v Model: 216-264 operating range, 50-60 Hz power frequency

Operating Ambient Temperature

- 0 to 50 C

Fuse Protection

- The monitor contains internal power line fuse protection. This fuse should be replaced with the same type by a qualified service technician.

Apple Token Ring 4/16 NB Card: Setup and Insertion Sequence

Revised: 6/8/92
Security: Everyone

Apple Token Ring 4/16 NB Card: Setup and Insertion Sequence

==========

Article Created: 2 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I can get the Token Ring 4/16 card to work on a Macintosh IIci, but not on a Macintosh Quadra. The system just reverts to the LocalTalk connection. I'm using the latest Network Installer Disk and have made sure that AppleTalk is active BEFORE installing the software.

What causes this problem?

DISCUSSION ----------

We suspect that you haven't connected the Macintosh/card to a MAU, or a problem prevents the card from becoming inserted on the ring.

Follow these steps to connect to a Token Ring:

1) Install the card and software (using Network Software Installer 1.1 or better yet, 1.2), and restart the Macintosh.

2) Open the Network CDEV and choose TokenTalk. You'll receive a dialog warning you that "Changing your AppleTalk connection will interrupt current network services..." Click OK.

3) Switch off the previous AppleTalk network connection.

4) If you have never configured this card before, you'll get a dialog asking if you want a 4MB or 16MB connection. After selecting this, insert the Token Ring card onto the ring with the parameters specified in the TokenRing CDEV.

5) If you can get close enough to the MAU that the Macintosh device cable

is attached to, you should listen for the sound of the MAU relay closing (audible click) inserting the Macintosh onto the ring. If there is no click, then you have one of the following situations:

- The TokenTalk software isn't properly installed on the Macintosh.
- The device cable isn't attached or is defective.
- The MAU port needs to be reset with the MAU set-up tool.
- The MAU port is defective.

Be sure the card isn't connected to the Ring-in or Ring-out ports on the MAU. They are for Trunk cables, and don't have relays to allow proper ring insertion.

If you hear a click, followed by another click, this indicates that the card tried to insert, and, based on network feedback, determined that it wasn't welcome. Two common causes for this are:

- Attempting to use the wrong network speed
- The address assigned is in use by another active device.

If you hear just one click, then the Macintosh has inserted successfully on the Token Ring.

Caution: When installing or removing NuBus cards from a Macintosh Quadra, turn it off, AND unplug the power cord! Macintosh Quadras continue to supply power to the NuBus, as stated in the NuBus '90 specifications. This is a potential hazard to NuBus cards being installed or removed. Specifically, low current at +5V is available on the new STDBYPWR pin when main power is off, and the AC cord is plugged in.

Apple Products That Contain Non-Volatile Memory (3/94)

Revised: 3/31/94
Security: Everyone

Apple Products That Contain Non-Volatile Memory (3/94)

==========

Article Created: 18 June 1992
Article Reviewed/Updated: 31 March 1994

TOPIC ----------

Which Apple products contain non-volatile memory, and how much? Can user-generated data be stored there? If yes, how is it erased?

DISCUSSION ----------

Through March 1993, the only Apple products that contain non-volatile memory are the Macintosh computers and the LaserWriter printers.

Here are some details:

The Macintosh 128K, Macintosh 512K, and Macintosh 512Ke contain 20 bytes of parameter RAM (PRAM). These 20 bytes of PRAM are documented on pages II-369 through II-371 of Inside Macintosh Volume II.

The Macintosh Portable has 128 bytes of PRAM, and the remaining computers in the Macintosh family have 256 bytes of PRAM.

PRAM contains only configuration information, not user data.

The same is true for non-volatile memory in Apple LaserWriter printers -- only configuration information, like page count, baud rate, emulation mode, and port to use, is stored. The printer memory, like computer memory, is erased when the power is turned off.

With System 6, to clear PRAM, press and hold the Command, Shift, and Option keys while opening the Control Panel. Not all PRAM is cleared with this method -- the original 20 bytes of PRAM (refer to Inside Macintosh Volume II, pages II-369 through II-371) are not cleared. Only the remaining bytes, which are considered confidential, are.

With System 7, to clear PRAM, press and hold the Command, Option, P, and R

keys while you restart the Macintosh. This clears all PRAM.

Macintosh PC Exchange: Workaround to Get AFE to Recognize DOS

Revised: 9/1/94
Security: Everyone

Macintosh PC Exchange: Workaround to Get AFE to Recognize DOS

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 01 September 1994

TOPIC ----------

When I have Macintosh PC Exchange installed (or DOS mounter, AccessPC, and so on), Apple File Exchange (AFE) or MacLink Plus PC don't recognize DOS disks as DOS disks. Because Macintosh PC Exchange makes a PC disk appear as a Macintosh disk, AFE thinks it's a Macintosh disk and won't display the MS-DOS menus.

DISCUSSION ----------

This is how we would expect AFE and Macintosh PC Exchange to behave.

The workaround for AFE is as follows:

1) Insert the MS-DOS disk.

2) From the "Mac to Mac" menu, select the "Other translations..." menu item.

3) Select the translator you want to use.

4) Make sure the "Add" radio button is selected and click "OK".

5) Repeat the process for all of the translators you want to use.

This will add the translator(s) to the "Mac to Mac" menu. Now all you have to do is select the translator(s) so it's checked in the menu and you will be able to use it.

Alternatively, you can disable Macintosh PC Exchange during the session with Apple File Exchange or MacLink Plus PC.

A/UX 3.0: Macintosh Quadra 900 Ethernet NB Card Address (12/94)

Revised: 12/14/94
Security: Everyone

A/UX 3.0: Macintosh Quadra 900 Ethernet NB Card Address (12/94)

==========

Article Created: 21 September 1992
Article Reviewed/Updated: 14 December 1994

TOPIC ----------

The Macintosh Quadra 900 on-board Ethernet hardware address vendor code isn't the standard Apple code. The Apple identification for all Apple Ethernet-based hardware is 080007. The older EtherTalk NB card was actually a 3COM card, and carried their identification of 02608C.

Under A/UX, I ran the program etheraddr, and this was the result:

```
bedevere.root # etheraddr
10:00:e0:29:a6:c3
```

(My computer name is bedevere.usc.edu and I'm logged in as root.)

I get the same address when I'm just running System 7 and ask for the Ethernet address in the MacTCP CDEV (by using option-click on the network icon in the MacTCP CDEV).

I also see this address in the ARP caches of Novell servers and cisco routers that I ping.

DISCUSSION ----------

This problem was fixed after the release of A/UX 3.0. The information has also been posted on both ftp.support.apple.com, and aux.support.apple.com servers. Here is the description of the Read Me file:

The enclosure file contains two new Ethernet modules, 'ao' (on-board) and 'as' (Ethernet NB card), and an executable file, 'etheraddr', for A/UX 3.0. These are the patches for where the internal Ethernet physical address appears on Ethernet NB card, and the Sonic chip set on Quadra 900/ 950 main logic board in which the address was burned in bitwise reverse from the original EtherTalk NB (ae6) card.

LaserWriter IIf and IIg: Serial Configuration

Revised: 6/8/92
Security: Everyone

LaserWriter IIf and IIg: Serial Configuration

==========

Article Created: 2 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I have a SPARCstation connected to a LaserWriter IINT via serial cable at 38.4 Kbaud. I use the PostScript program shown on page 120 of the LaserWriter IINT/NTX Owner's Guide. I just recently upgraded the printer to a LaserWriter IIf, and haven't successfully downloaded the same PostScript file.

Here are my questions:

1) Can the LaserWriter IIf communicate at 38.4 Kbaud?

2) Is the PostScript command to download changes different?

DISCUSSION -----

In answer to your questions:

1) The LaserWriter IIf and IIg can't communicate at 38.4Kbaud. The available rates are 300, 600, 1200, 1800, 2400, 3600, 4800, 7200, 9600, 19.2, and 57.6.

2) While PostScript Level 2 does these things a bit differently than previous implementations, a compatibility operator does exist for setsccbatch. This allows old programs to work as before, assuming they use the proper arguments. An advantage of the new methods would be more detailed control over the parameters for each push-wheel position. For instance, the below code sets position 9 to 9600 baud with 8 data bits, 1 stop bit, no parity, DTR flow control, and PostScript Binary mode to allow software-controlled emulation switching:

```
(%Serial_NV4)                %We're going to modify the 4th changeable pos.
<< /Baud 9600                %Mark a dictionary on the stack with key/value
   /DataBits 8               %pairs for the various settings.
   /StopBits 1
   /Parity /None
   /FlowControl /Dtr
   /Protocol /Binary
   /Interpreter /PostScript
   /On true
   /Enabled true
>> setdevparams              %Create the dictionary and execute
setdevparams.
                             %(which uses it to modify the parameter set.)
```

A large number of combinations are available, just as when using the setsccbatch operator. The difference is that this is a little more flexible, a little easier to read, but is also device specific (at least currently) to the LaserWriter IIf and IIg.

LaserWriter IIf and IIg: Aldus PPD Files and Print Area

==========

Article Created: 2 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

The printable area of the LaserWriter IIf and IIg is much smaller than the earlier Apple LaserWriter printers. These are the actual print areas in the PPD files from PageMaker 4.2:

- General: 197.2 x 280.8mm
- LaserWriter IIf & IIg: 191.9 x 275.2mm
- LaserWriter IINTX: 199.0 x 290.0mm

Is there a fix to this problem?

DISCUSSION ----------

Aldus purposely created their PPD files for the LaserWriter IIf and LaserWriter IIg this way. Their reason is that a 2MB LaserWriter IIf or a 5MB LaserWriter IIg with PhotoGrade turned on, have a smaller imageable area as compared to previous Apple LaserWriter printers.

If you use a LaserWriter IIf with 4MB of RAM or a LaserWriter IIg with 8MB of RAM, Aldus suggests using the "General" PPD and modifying the "PDX" file to adjust the number of lines and screen angle. To do this, look on page 67 of the "New Features Manual." If you need more information, please contact Aldus Technical Support.

You can find contact information for the various vendors in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Macintosh: PDS Expansion Slot Differences (2/95)

Revised: 2/24/95
Security: Everyone

Macintosh: PDS Expansion Slot Differences (2/95)

==========

Article Created: 2 June 1992
Article Reviewed/Updated: 24 February 1995

TOPIC ----------

Are all Processor Direct Slot (PDS) connectors in various Macintosh models different? If so, what are the differences?

DISCUSSION ----------

Macintosh computers use two main types of hardware expansion:
• A single processor-direct expansion slot
• NuBus expansion slots

A single PDS is used by the Macintosh SE, SE/30, LC, LC II, Portable.

Models that provide both PDS and NuBus slots are the Macintosh IIci, IIfx, Quadra 610 (smaller, 7-inch NuBus slot), 650, 700, 800, 900, and 950, the Power Macintosh 7100 series, and Power Macintosh 8100 series.

Note: The Macintosh Classic, Classic II, and PowerBook computers have no hardware expansion slots, although they do provide for internal memory expansion.

A PDS implementation brings the microprocessor address, control, and data lines, along with clock, power, and a few model-specific signals, to a single expansion connector on the main logic board. Apple uses the PDS expansion interface on compact, or small-footprint Macintosh computers such as the Macintosh SE, the SE/30, LC, or any design for which NuBus is inappropriate. The Macintosh II class of computers, such as the IIfx and the Quadras, also include a PDS connector, but their primary means of expansion is the NuBus interface.

Apple attempts to limit the number of PDS configurations available without compromising the Macintosh design, but since the PDS expansion interface is an extension of the microprocessor, the configuration of the slot connector will change whenever a newer, more powerful microprocessor is used.

68000 and 68020 PDS Interfaces

The Macintosh SE was the first Macintosh offering a PDS expansion. The SE uses a 96-pin expansion connector. The 96-pin expansion connector on the Macintosh Portable is physically identical to that of the SE, but the pinouts and signals available are different. The 68020 PDS interface in the LC is also a 96-pin connector that is physically identical to that in the SE and Portable; however, the pinouts and signals are different.

68030 PDS

Both the SE/30 and the IIfx have 120-pin connectors. Once a PDS adapter card is installed in the IIsi, it also provides a 120-pin PDS expansion connector. Whereas most of the signals on the 68030 PDS connector are the same on all models, a few signals are computer-specific. Therefore, PDS cards developed to take advantage of computer-specific signals may not work in other "030" Macintosh computers.

Macintosh LC and LC II

The 68020 PDS in the Macintosh LC uses a Euro-DIN 96-pin connector, as does the 68030 PDS in the LC II and the LC III. The PDS in LC-class models are electrically and physically identical.

The PDS used in the Macintosh 630 family is similar to that used in the LC, many PDS cards designed for the LC family will work in a Macintosh 630 class computer with the exception of the IIe Card.

68040 PDS

The 68040 PDS in the Macintosh Quadra is a 140-pin connector. The Macintosh Quadra's PDS cards aren't compatible with other Macintosh computers, and vice versa. The connectors are physically different, and the signals and logic were designed to support the 68040.

AV Macintosh computers

The 660AV and Quadra 840AV do not have a PDS connector. The 660AV has only a NuBus adapter slot.

Macintosh 630 family computers

The Macintosh 630 family, including the LC 630 and the Performa 63x computers, have three unique internal expansion slots. They include:

- One 114-pin LC compatible PDS
- One 112-pin communication port for modem and ethernet
- One 60-pin video-in slot for real time video display, capture and overlay

To verify that a particular third-party product is compatible with a specific Macintosh, we recommend you check with the supplier of that product. Additional technical information on PDS is documented in these manuals:

- Designing Cards and Drivers for the Macintosh Family
- Guide to the Macintosh Family Hardware

Article Change History:
24 Feb 1995 - Corrected Macintosh II systems that have PDS and NuBus slots.
17 Aug 1994 - Revised Macintosh 630 family details.
18 Jul 1994 - Added Quadra 630 family to discussion.

Personal LaserWriter NTR: Added RAM for Font Storage and Cache

Revised: 6/29/92
Security: Everyone

Personal LaserWriter NTR: Added RAM for Font Storage and Cache

==========

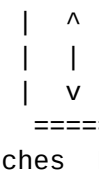
Article Created: 11 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What page sizes are available with the Personal LaserWriter NTR? Will adding memory increase the printable area?

DISCUSSION ----------

With 3MB of RAM (standard configuration), the Personal LaserWriter NTR provides these page sizes:



Page Type	Inches	Points	Inches	Points
a4	7.89	568.32	11.42	822.00
a4small	7.57	545.28	11.00	792.00
b5	6.72	483.84	9.81	706.56
legal	8.11	583.68	13.67	984.00
letter	8.11	583.68	10.67	768.00
lettersmall	7.89	568.32	10.30	741.84

Adding RAM does not increase the printable area -- added RAM is used for font storage and font cache.

Kodak Photo CD: Session Format, Compression, and QuickTime

==========

Article Created: 2 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I understand that the existing CD-ROM drives are single session. Is Kodak's service of putting slides on CD going to be single, multiple, or both session format? Secondly, will the images be compressed using Kodak's compression? If so, will we get a new QuickTime compression INIT?

DISCUSSION ----------

Kodak's Photo CD incorporates the Orange book specification. This is the multisession specification. However, it's possible to have a "single multisession" or one session while using the Orange book specification. In other words, if the first session of a multisession CD fills the entire CD, it will be considered a single session, while still providing all the appropriate disc information to comply with the multisession specification. There just won't be a second session on the disc.

The AppleCD SC Plus and the AppleCD 150 both read the first session of a multisession CD. If the first session fills the entire disc, then these two Apple drives will be able to read the entire disc. The first CD-ROM drive from Apple, the AppleCD SC, won't be able to read a Kodak Photo CD.

Kodak will be using their own lossless compression technique. The compression 'codec' (COmpressor-DECompressor) will be supplied in a new release of QuickTime. The details of how the Photo CD codec will be supplied haven't been stated yet. It's possible to create a codec that doesn't require a new version of the QuickTime extension. However, as with the codecs that ship with the current version of QuickTime, they can be incorporated directly into the QuickTime extension itself. Since this is possible, it's unclear how the Photo CD codec will be shipped.

PowerBook: Terminal Emulation and Cursor Keys 8/92

==========

Article Created: 2 June 1992
Article Reviewed/Updated: 5 August 1992

TOPIC ----------

I'm using emulation software such as MacTerminal 3.0 and Mac330 in VT320, VT220, and VT100 emulation mode on a PowerBook. When run on other Macintosh desktop units, I get correct cursor key emulation. On Mac330 program, cursor keys work, but on MacTerminal they don't. What is the mapping of the cursor keys for the MacTerminal software? Is this a problem with MacTerminal or the PowerBook?

DISCUSSION ----------

This is a known problem with the VT320 and VT102 Tools. They don't recognize the PowerBook keyboards. Mac330 probably uses its own VT330 emulation either in its own Tool, or application, and therefore doesn't have this problem.

Engineering is working on the next version of the Tools to fix this problem. The Arrow keys in the MacTerminal Keys menu should work. You can use a macro program such as QuicKeys to map the PowerBook's arrow keys to those keys in the menu.

Apple PC 5.25 Drive: Description

Revised: 6/8/92
Security: Everyone

Apple PC 5.25 Drive: Description

==========

Article Created: 28 May 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

This article describes the Apple PC 5.25 Drive.

DISCUSSION ----------

The Apple PC 5.25 Drive, in combination with the Apple File Exchange utility and the Macintosh II PC Drive Card or the Macintosh SE-Bus PC Drive Card, enables users to exchange data between their Apple and MS-DOS formatted 5.25-inch disks.

Both the Macintosh II and Macintosh SE-Bus PC Drive Cards are designed to work with the Macintosh II and Macintosh SE as controllers for the Apple PC 5.25 Drive. Internally mounted, these cards provide the interface that allows the Macintosh II and Macintosh SE to read and write files in the format familiar to MS-DOS programs.

Apple File Exchange provides the software link to the data in the 5.25 drive. Apple File Exchange also provides a translation capability. For example, with the proper translator, it can translate a WordStar document to a MacWrite document. Apple and other companies will provide Apple File Exchange application-to-application translators.

Third-party developers market coprocessor cards that work with the Apple PC 5.25 Drive, and are designed to allow the Macintosh II or Macintosh SE to run MS-DOS application software.

Apple Hard Disk 80SC: Description (Discontinued)

==========

Article Created: 1 June 1992
Article Reviewed/Updated: 20 May 1994

TOPIC ----------

This article describes the Apple Hard Disk 80SC.

DISCUSSION ----------

The Apple Hard Disk 80SC provides disk storage for Macintosh, Apple IIe, and Apple IIGS computers. It allows you to access data up to six times faster than 3.5-inch floppy-disk drives. SCSI expansion lets you connect as many as three additional SCSI devices to an Apple IIe or Apple IIGS or as many as six to a Macintosh.

Features

- 80 megabytes of storage
- Fast data access: 30 milliseconds
- Industry-standard SCSI (Small Computer System Interface)

Benefits

- Provides space for data-intensive files, large documents, and sophisticated applications.
- Lets you build an AppleShare system.
- Makes it easy to work in the AT&T UNIX environment.
- Provides faster data transmission than a serial interface.
- Allows expansion with additional hard disks, tape backup systems, or other SCSI peripherals.
- Provides connection to the Apple Tape Backup 40SC for efficient file backup and restoration.
- Assures a growth path.

Order Numbers

- Apple Hard Disk 80SC M2688
- Apple SCSI System Cable M0206
- Apple Cable Terminator M0209

Security: Everyone

Apple SuperDrive, Internal: Upgrade Description

==========

Article Created: 1 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

This article describes the Apple Internal SuperDrive.

DISCUSSION -----

The Apple Internal SuperDrive maximizes internal floppy disk storage for the Macintosh SE, Macintosh II, and Macintosh IIx computers. It also exchanges information between Macintosh files and MS-DOS, OS/2, and ProDOS files.

It provides access to 75 percent more storage space than 800K disk drives. It can format, read from, and write to Apple 400K, 800K, and 1.4MB disks, as well as MS-DOS 720K, 1.44MB, and compatible 3.5-inch disks.

Features

- Uses high-density (HD), double-sided 3.5-inch floppy disks
- Compatible with Macintosh, MS-DOS, OS/2, and ProDOS formatted disks
- High-Density disk detector
- Internal drive

Benefits

- Provides almost twice the capacity of on-line data storage available from 800K disks.
- Holds large data files and applications on one disk, reducing the need to swap disks.
- Protects data, because disks are rugged and easy to carry.
- Can read from and write to Macintosh 400K, 800K, and 1.4MB disks.

- Allows Macintosh users to work with files stored on MS-DOS 720K or 1.44MB MFM disks and ProDOS disks, using the Apple File Exchange utility.
- Automatically formats to correct disk capacity (Apple 800K or 1.4MB format, or MS-DOS 720K or 1.44MB format).
- Saves desk space.

Order Number

- Apple Internal SuperDrive
  M0247

Apple SuperDrive, Internal: Specifications (9/95)

==========

Article Created: 1 June 1992
Article Review/Updated: 19 September 1995

TOPIC ----------

This article gives technical specifications for the Apple Internal SuperDrive.

DISCUSSION ----------

Recording Media

- Disk diameter: 3.5 inches
- Recording surfaces: 2
- Number of cylinders: 80

Capacity

- Formatted data: 1.416MB
- Unformatted data: 2.0MB

*

Drive Characteristics

- Seek time (track-to-track): 6 milliseconds maximum
- Settle time: 30 milliseconds maximum
- Data transfer rates: 500 kilobits per second
- Drive startup time: 600 milliseconds maximum

Interface

- Apple proprietary interface (same as existing 800K drive)

Environmental Requirements

- Operating temperature: 50 to 104 F (10 to 40 C) ambient
- Storage temperature: -40 to 140 F (-40 to 60 C) no condensation

• Relative humidity: 5% to 90%

Size

• Height: 1.60 inches (4.1 cm)
• Width: 4.16 inches (10.6 cm)
• Depth: 6.56 inches (16.7 cm)

System Requirements

To use the Apple Internal SuperDrive Upgrade, you need the following:

• Macintosh SE, Macintosh II, or Macintosh IIx computer.
• System software 6.0.3 or later

NOTE:
This upgrade has been discontinued.

Article Change History:
19 Sep 1995 - Revised to show discontinued upgrade.

Apple File Exchange: Contrasted to File System Translators

==========

Article Created: 11 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What are the technical differences between translating AppleWorks files with AFE, and using the GS/OS HFS FST to copy them to an HFS disk? I tried this, and got the following results:

AFE:
Type:1A__
Creator: pdos
1 resource, type pdos, size 10 bytes, ID 0

HFS FST
Type: p___
Creator: pdos
No resource fork present.

The purpose of this is to translate some AppleWorks files into GreatWorks or ClarisWorks using the XTND translators. If I translate them with AFE, everything works as intended. Why doesn't it work with the HFS FST, and why didn't the creators of the FST make it produce the same results as the previous translation standard (AFE)?

DISCUSSION ----------

The most important difference between AFE and any FST is that AFE is a file CONTENT translator, while FST (File System Translator) is a file SYSTEM translator.

A file translator does the following:

• Changes any filetype-specific information.

- Translates the specific information into a different layout.
- Adds any needed datatypes or header information.
- Possibly eliminates unneeded data.

This is specific to content of individual files, such as converting AppleWorks documents to ClarisWorks documents.

FST, on the other hand, translates the file system, including the following:

- Directory structures
- Subdirectory structures
- File types
- Block structures
- Other elements of the filing system

An FST DOESN'T translate the contents of an individual file. An FST DOES allow a foreign file system to reside on a native computer. For example, the Apple IIGS Finder desktop can display Macintosh HFS diskettes.

The results obtained are in line with each of the procedures. Translating the file contents from ProDOS to Macintosh OS requires adding some items, such as the resource fork and a specific file type. Generally a program that translates the contents of a file will also add a file type. This often allows double-clicking the translated file to open the file and application.

The contents of a file aren't touched when copying a file while an FST is in use. In the case presented, the 'p___' type is a generic type representing "some type of (unknown) ProDOS file."

AFE is an appropriate procedure for translating the contents of a file from one application format to another application format. FST is an appropriate method for allowing a disk from one operating system to mount while using a different operating system.

Thinking of FSTs as the "current translation standard" and AFE as the "previous translation standard" is an incorrect approach to understanding the purpose of these two entirely different operations. The creators of FST didn't have anything close to AFE in mind when they began to design their product. Their intention was to translate the filing system information, not the file contents. AFE was designed to translate the file contents, not the system of filing.

AppleTalk Remote Access: Using Long Phone Numbers

Revised: 8/13/92
Security: Everyone

AppleTalk Remote Access: Using Long Phone Numbers

==========

Article Created: 11 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I need to allow about 40-50 digits in the AppleTalk Remote Access dial string to use the corporate phone network.

DISCUSSION -----

Remote Access can accommodate a phone number up to 128 characters. The real limitation lies in a modem's command buffer, which is typically 30 characters. Keep in mind that the modem command to dial (ATDT) takes up 4 of those characters; so the maximum length for a phone number is actually 26.

The workaround is to break the long phone number into two parts. Hard code the first part within the modem script. Users enter the second part as they would normally enter a phone number.

Most modems support the ";" command, which tells the modem to return to local command state after dialing. This allows the modem to dial the first part of the phone number, go back to command state, then dial the second part of the phone number.

To do this, you need to modify the Remote Access modem script and add the following two lines:

```
write "ATDTxxx...xxx;\13"
pause 80
```

"xxx...xxx" indicates the first part of the phone number, and can be up to 26 characters. "pause 80" tells Remote Access to wait 8 seconds before continuing. This gives the modem time to complete the first dial command.

You may need to modify this value for your particular modem. The Apple Data Modem 2400 takes about 8 seconds to dial a 26-character phone number.

Here's an example of the Apple Modem 2400 modem script with the modification:

```
!
! The modem is ready so enable answering, or originate a call
!
@LABEL 8
pause 5
ifANSWER 30
note "Dialing ^1" 3
write "ATDTxxx...xxx;\13"
pause 80
write "ATDT^1\13"
```

A/UX: Configuring to Access Name Server (9/94)

==========

Article Created: 11 June 1992
Article Reviewed/Updated: 21 September 1994

TOPIC ----------

How do you configure an A/UX box to use an existing Domain Name Server on the network?

DISCUSSION ----------

The easiest way to make A/UX use an existing name server on the network, is to create a file called /etc/resolv.conf. The file should contain the domain you belong to and the IP address of the name server for that domain.

For example, the following lines would be the content of the /etc/resolv.conf file that points to the name server for the domain called testing.com:

```
domain testing.com
nameserver 192.1.1.1
```

This says that the domain you belong to is called testing.com, and that the nameserver is located at 192.1.1.1.

Macintosh: What's Needed to Network with Altos 5000 (SCO UNIX)

==========

Article Created: 11 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

An Altos 5000 running SCO UNIX, and TCP/IP net BIOS are necessary to connect a Macintosh IIci computer and a Macintosh Quadra 700 into a UNIX platform. As far as I know, I should be using 10Base-T with 64K buffered EtherNet cards and a TCP/IP hardware router. I'm uncertain of the software necessary.

DISCUSSION ----------

Using Ethernet to make the basic connection to the Altos 5000 sounds like an excellent choice. If the Altos is already connected to an existing network, all you need is an Ethernet card for the Macintosh and a TCP/IP-based connection application to start exchanging data with the UNIX host. As for the Ethernet card, we recommend the Apple Ethernet NB card.

There are several ways to access the server, and more specifically the data stored on the server. You could use any of the UNIX-based AFP packages available from various vendors. Using one of these packages allows the Macintosh ease of use without throwing in the complications of UNIX, FTP (File Transfer Protocol), Telnet, and so on.

Depending on what type of data you need to access and user expectations, you could use any of the MacTCP-based packages to log on to, and transfer files from, the server. You could also use a Macintosh NFS application, such as that available from Intercon or Cayman. This would allow the Macintosh users to access UNIX-resident files as though they were local files. You might consider the Intercon or Wollongong commercial products or the widely-used NCSA public-domain package. You might also consider a CommToolBox-based application. You could use any CommToolBox-based communications program, such as MacTerminal 3.0, VersaTerm Pro, and

so on. Or you might use a telnet/ftp tool available from a variety of sources, like InterCon and VersaTerm (ships the product with a telnet tool).

For details about these products, use "Macintosh and TCP/IP and Applications" as a search string. To locate a vendor's address and phone numbers, use the vendor name as a search string.

Apple IIGS: Using American Micro Research Floppy-Disk Drives

==========

Article Created: 12 June 1992

Article Change History

11/03/92 - CORRECTED
- The vendor search string information

TOPIC ----------

I have an American Micro Research (AMR) 3.5-inch floppy disk drive connected to my Apple IIGS running GS/OS 6.0. The AMR drive hangs or continues to spin when accessing other drives. In addition, my AMR 5.25-inch drive does not appear on the desktop under GS/OS 6.0, or it spins forever. Both drives work fine under GS/OS 5.0.4.

DISCUSSION ----------

According to American Micro Research Technical Support, the 5.25-inch drive should boot properly under GS/OS 6.0. We suggest that you contact AMR directly to discuss this problem.

AMR said that their 3.5-inch drive will hang if a disk is not inserted in the drive before you boot the system. The recommended workaround is to insert a disk in the AMR 3.5-inch drive before you power up the computer.

AMR also said that using either GS/OS 5.0.4 or 6.0 is fine, but using the 5.0.4 driver with GS/OS 6.0 will not correct the problem.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

PowerBook Series: Conditions that Block Sleep Mode (7/95)

==========

Article Created: 26 June 1992
Article Reviewed/Updated: 21 July 1995

TOPIC ----------

My Macintosh PowerBook won't go into the Sleep mode when the PowerBook AC Adapter is plugged in.

DISCUSSION ----------

Here are the conditions under which the PowerBook computers will not go into Sleep mode:

Software

- The "Stay Awake when plugged in" box is checked in the Portable control panel.
- The PowerBook is connected to a network, or has network volumes mounted.
- File Sharing is enabled.
- AppleTalk is active, and the AC Adapter is plugged in.
- AppleTalk Remote Access is installed and the "Answer Calls" option is selected.
- Update SCSI driver with formatting software.
- Verify that third-party hard drive supports the sleep function.
- Verify that the formatting software is compatible with the system version on the PowerBook; update if appropriate.
- Some third-party applications keep the CPU busy, not allowing idle

processor time for sleep to occur.

• If you have any 7.5 Apple Guide help file open.

Hardware

• Check for failure of hard drive or hard drive cable.

• Check for possible logic board failure.

If none of these conditions is present, you may have a system software problem. Try re-installing the system software.

Article Change History:
21 Jul 1995 - Added information about 7.5 Guide files.
15 Apr 1994 - Additional possible causes added to article.

Aldus Freehand: Use 3.0 or Later w/ PostScript Level 2 Printers

==========

Article Created: 15 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

The LaserWriter IIf evidently can't print documents with two or more logos. It hangs or times out. The font is a Type 3 PostScript font, created with Art Importer. It consists of various company logos.

I have tried printing over the network as well as printing to a single printer directly connected to a Macintosh. The results were the same. We use AppleTalk over twisted-pair.

DISCUSSION ----------

The problem is that the characters were created with Aldus Freehand 2.2 or earlier.

Aldus Freehand 2.2 and earlier versions improperly use the "setcolor" PostScript operator. This misuse causes problems with the LaserWriter IIf, LaserWriter IIg, Personal LaserWriter NTR, and any other PostScript Level 2 printer.

Use Aldus Freehand 3.0 or later to create the graphics and the problem should no longer occur.

Macintosh Quadra 950: Video Characteristics

==========

Article Created: 15 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

What are the statistics for the Macintosh Quadra 950 computer's video with respect to scan rates, resolution, and sense line configuration?

DISCUSSION -----

Here's the information on the Quadra 950 computer's support for 1024 x 768 (19-inch) monitors. Though Apple doesn't sell a monitor with these characteristics, there are third-party monitors that work with this timing. One example of a compatible monitor is the standard SuperMac 19-inch Trinitron display (we believe their Hitachi-tube display works also). The higher end multisync type of display, such as the NEC Multisync 5fg is another example. Other solutions exist, and you will want to contact your supplier to determine your options.

Extended Sense Codes

Note for extended sense codes: A sense pin pair value of 0 means those pins should be tied together (as opposed to grounding the pins to pin 11); a value of 1 means don't connect the pins. DON'T wire any of these pins to ground.

Macintosh Quadra 950 Video Port Characteristics

Display	Sense pins 4-10 10-7 7-4	Hor x Vert Pixels	Dot Clock	Vert Refrsh	Horiz Refrsh

19-inch	1	1	0	1024 x 768	80	74.93	60.241

Maximum Pixel Depths Supported

Display size	512K VRAM	1MB VRAM	2MB VRAM
19-inch Color	4 bpp	8 bpp	16 bpp

AppleTalk: Isolating from SNA Traffic

Revised: 6/19/92
Security: Everyone

AppleTalk: Isolating from SNA Traffic

==========

Article Created: 15 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I have two separate rings on one Token Ring network with the following set up:

• An AS400 on one ring, and

• An AppleShare file server on the other.

On one Macintosh, I would like to have access to the AS400 (not acting as a Gateway) and the AppleShare file server. I want to keep AFP/PAP on its own ring for now. Of course, I have two Token Ring cards in the Macintosh.

Configuration for SNA•ps 1.1 and Andrew Token Access software will be easy. How do I configure the Macintosh workstation (AppleTalk) software to access only the other TR card? Do I need the Internet router to accomplish this?

DISCUSSION -----

You can come close to the configuration that you describe, but there will be one twist, as you will see later. You can certainly limit the AppleTalk traffic to one of the rings. Using the network control panel on the computer connected to both rings, you choose the AppleTalk access to be the TokenTalk icon corresponding to the ring that has the AppleShare server on it. The Network control panel will have a TokenTalk icon representing each card installed in the computer, so it's just a matter of choosing the correct icon.

You don't want to have an Internet Router on this computer because that would imply that you would be routing AppleTalk to other physical networks (that is, the other Token Ring network).

Now, on the SNA•ps and Andrew side of things, you will have a SNA•ps gateway configured on this same computer. The gateway will be configured for APPC communications with the AS400 (necessary for the Andrew software). One note of caution at this point -- any Macintosh on the AppleTalk ring will be able to use this gateway if it has the appropriate SNA•ps client software. You won't be restricting this to just the gateway computer. There's still no AppleTalk on the other ring, but that's just a slightly different look at things. Of course, if you don't want other computers to have access to the gateway, don't give them the client software.

Macintosh Portable Data Modem 2400: Description (Discontinued)

Revised: 6/20/94
Security: Everyone

Macintosh Portable Data Modem 2400: Description (Discontinued)

==========

Article Created: 8 June 1992

TOPIC ----------

This article describes the Macintosh Portable Data Modem 2400.

DISCUSSION ----------

The Apple Macintosh Portable Data Modem 2400 allows the Macintosh Portable computer to communicate with other personal computers, minicomputers, and mainframes to access and exchange information.

A standard asynchronous 2400-bps modem, the Macintosh Portable Data Modem 2400 can communicate with any standard data modem operating at 2400, 1200, or 300 bps.

Its low-power design preserves the battery power of the Macintosh Portable computer. And it can operate unattended; the modem is designed to receive files when the user is away from the computer.

Features
- Industry-standard modulation techniques: Bell 103, Bell 212A, CCITT V.22, CCITT V.22bis
- Automatic "wake up" feature
- Low-power design
- Auto dial and auto/manual answer
- Supports a subset of the AT command set

Benefits
- Lets you communicate with any computer that uses a standard data modem.
- Lets you receive files when away from the Macintosh Portable computer.
- Preserves the battery power of the Macintosh Portable computer.
- Saves time and effort by permitting unattended operation.
- Lets you control your modem through the use of direct modem commands.

Order Number

- Macintosh Portable Data Modem 2400
  M0250

Empower: Modifies SCSI Drivers

==========

Article Created: 16 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Does Empower substitute its own hard disk driver for the installed driver (Apple or PLI)? Sometimes when starting up, the system gets confused.

Does Apple recommend not using products like Empower that substitute hard disk drivers?

DISCUSSION -----

Empower does indeed modify the SCSI driver on the startup disk of systems where it's installed.

Apple doesn't have any specific recommendations to make in this area. If a customer requires the features provided by a product such as Empower, it's up to the customer to decide what product to purchase, if any. The use of such a product doesn't void any warranties nor relieve Apple of support responsibilities for the Apple hard disk.

If a customer is having problems with an Apple hard disk, Apple will ask the customer to install only Apple drivers on the hard disk. If the problem is resolved by this, Apple will tell the customer that the problem isn't related to the Apple equipment and to contact the manufacturer of the problem product.

If the third party can't solve the problem, Apple recommends not using the product, at least in that particular case.

PowerBook: Re-Chooses AppleTalk Network ID After Sleep 10/92

Revised: 5/16/94
Security: Everyone

PowerBook: Re-Chooses AppleTalk Network ID After Sleep 10/92

==========

Article Created: 19 October 1992

TOPIC ----------

If I understand the AppleTalk protocol correctly, a CPU has a unique ID when it's connected to a network. A desktop Macintosh will assume that the network ID is the same even if it has been disconnected from the network (without reboot). This can of course cause a problem if the network ID has been assigned to another CPU in the meantime. Does this apply to the Macintosh PowerBook systems when they are put in sleep mode as well, or will the PowerBook ask if the old ID is still available when it wakes up?

Does the message displayed when I put it into sleep mode mean that I lose my network connections?

DISCUSSION ----------

When a Macintosh PowerBook system goes into "sleep" mode, the following alert is displayed:

> "Putting the computer to sleep may cause you to lose some network services. Check your connections in the Chooser next time you wake the Macintosh."

Actually, if the PowerBook is asleep for more than a minute or so, you will lose all of your AppleTalk connections.

If your PowerBook is put into sleep mode and another AppleTalk device acquires the PowerBook's AppleTalk node ID, the PowerBook will select another AppleTalk node ID.

We tested this with a PowerBook 170. First we determined what AppleTalk node ID the PowerBook 170 was using via Inter•Poll. We then put the PowerBook 170 into sleep mode. We connected a Macintosh SE to the same LocalTalk network and gave it the AppleTalk node ID the PowerBook 170 was using. We woke up the PowerBook 170, and it selected a new AppleTalk node ID.

Personal LaserWriter NTR: Printing Legal Size with PC Software

Revised: 11/11/92
Security: Everyone

Personal LaserWriter NTR: Printing Legal Size with PC Software

==========

Article Created: 19 October 1992

TOPIC ----------

I purchased a Macintosh Quadra 700, a 16-inch color monitor, and a Personal LaserWriter NTR. I have an application from VAR that I run under SoftAT. I found it impossible to print to the Personal LaserWriter NTR from within SoftAT.

I purchased an i386 PC just to run this software. Now I can print to the Personal LaserWriter NTR, but not legal size. The printer is set to HP Emulation. A setup string is in a dialog box that comes up in the UAR software. The book from UAR states that to print to an HP requires the setup string to read: HPII Chr(27);"&l3A". This string in the dialog box along with the switch on the HP set to legal will produce legal output, but there's no switch on a Personal LaserWriter NTR. Also, when I include the lower case "L" in the setup text string, I get a PostScript error.

Personal LaserWriter NTR Configuration:

- Thumb wheel set to position 8: This should yield HP IIP emulation.
- Baud rate of 9600
- Parallel port on the Personal LaserWriter NTR from the i386 PC
- DB-25 male to Centronics 36-pin parallel cable

DISCUSSION ----------

Our testing indicates that the only way to print legal size documents without a legal size paper tray installed is to set the port, in this case the parallel port, to PostScript mode and prepend all HP LaserJet IIP jobs with the following:

```
legal
currentfile /LaserJetIIP statusdict /emulate get exec
```

and end the job with a control-D (eof character).

The "legal" operator in the first line tells the LaserWriter to use a legal size frame buffer for the current job.

If you install a "Personal LaserWriter 250 Sheet Cassette Base" and use a legal tray, you should have no problems using the parallel port in HP LaserJet IIP emulation mode and printing legal size documents.

TCP/IP: Available TCP/IP-Based Macintosh Applications (12/95)

==========

Article Created: 15 June 1992
Article Reviewed/Updated: 13 December 1995

TOPIC ----------

Here is a summary of TCP/IP-based applications available for Macintosh.

DISCUSSION ----------

For more information on a third-party vendor's applications, contact the vendor directly. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Novell, Inc.

LAN WorkPlace for Macintosh provides Apple Macintosh users access to a broad range of hosts, servers, and workgroups on an Ethernet network. The components that make up LAN WorkPlace include:

- Telnet, which provides VT220, VT100 terminal emulation.
- FTP, for transferring files between hosts.
- Novell TCP/IP (or optionally MacTCP), the underlying transport layer.
- NetStat, a desk accessory for displaying network statistics.

Using the familiar Macintosh interface, users can access resources on an industry-standard TCP/IP network, including PCs, VAX minicomputers, IBM mainframes, UNIX workstations, and host-connected peripherals such as printers and plotters.

White Pine Software

White Pine Software Inc. offers a family of TCP/IP-based VT300 terminal-emulation and other applications for Macintosh.

The programs let Macintosh computers log on to VAX and UNIX computers to run text and graphics applications designed for DEC and compatible terminals.

Software Ventures Corporation

The MicroPhone communications software comes with a comprehensive set of tools for quick and easy TCP/IP access. Targeted to users of TCP/IP-based networks, such as the worldwide Internet. It feature new multisession communications capability, an improved scripting language and editor, new terminal emulation and new transfer protocols.

The Wollongong Group Inc.

Pathway Access for the Macintosh is a multiplatform graphical front end to TCP/IP services. With PathWay Access, users can transfer files between the Macintosh and any other computer that supports the open standard TCP/IP protocols. PathWay Access includes terminal emulations for DEC VT100, VT220, VT240, VT320, VT330 and VT340 terminals, as well as IBM 3278 Model 2, 3, 4 and 5 mainframe terminals.

Intercon

TCP Connect II is an integrated application that offers users the tools needed to become true hosts on a TCP/IP network. Using standards-based protocols, TCP/Connect II provides the user with a Macintosh interface to the most commonly used features of heterogeneous TCP/IP computing networks.

NFS/Share is a solution for Macintosh users wanting to take advantage of distributed file sharing within a multivendor environment.

NetShark is a next generation Internet application. NetShark includes a World-Wide Web browser and Email client. Both are designed to maximize function and performance letting you switch back and forth between web and mail.

InterServer Publisher is software that supports Web, FTP, and Gopher server functionality. The Web server includes support for forms and multiple connections. The FTP server supports different levels of access, from secure to anonymous. The Gopher server is background-friendly and self-configuring to let users quickly make information available on the Internet.

InterPrint will let Macintosh computers choose a UNIX PostScript printer on a TCP/IP network from the Chooser.

InterPPP II Lite is a standards-based solution that implements PPP according to published Requests for Comment (RFCs). Developed by the IETF, in cooperation with network vendors, PPP is a documented standard for connecting workstations to networks that is being deployed by many router and terminal server vendors as the standard solution for dial-in network access.

Planet X is an X Window System client for Macintosh computers. Any X Window System server, such as a Sun, Digital, HP, IBM workstation, X terminal, or even another Macintosh running an X server such as MacX can utilize the power of Planet X. The X server display shows exactly what is seen on the Macintosh screen, and the X server keyboard and mouse can be used to control the remote Macintosh.

UUCP/Connect provides a complete environment for reading electronic mail and USENET news via the UUCP protocol. Using Apple's Communications Toolbox, UUCP/Connect can be used over straight serial links, modems, AppleTalk, TCP/IP, ISDN, X.25, and more. It works with a number of common UUCP services, such as the service provided by Performance Systems International.

WatchTower is designed with network managers in mind, using the power and availability of the SNMP (Simple Network Management Protocol) standard combined with the Apple Macintosh to gain control over your network.

Advanced Software Concepts

TCPack provides all the necessary basic TCP/IP connectivity options. Advanced Software Concepts' products are Comm ToolBox tools which allow IBM terminal sessions and general telnet TCP/IP connectivity via a standard terminal emulator. There's no need to learn a new program. You just drop the tools in the System Folder, and start up a Comm ToolBox compatible terminal program. TCPack supports telnet and FTP (client and server) protocols.

Walker Richer & Quinn, Inc.

Reflection connectivity software gives Mac OS users the easiest possible access to host applications and data. A simple point-and-click of the mouse leads to a whole new world of information -- and dramatic improvements in productivity:

- Host connections are quick, simple, and reliable.
- Power Macintosh acceleration helps get the job done in record time.
- Routine tasks are easily automated with WRQ's powerful command language and support for Apple events and AppleScript.

Terminal emulations:

- HP 700/98, 700/96, 700/94, 700/92, 2392A, 2393A, and 2623A
- VT420, VT320, VT220, VT102, and VT52
- VT340 with ReGIS and sixel graphics, 330, 241, 240, and Tektronix 4010/4014

Specialized features: Full Macintosh functionality with Power Macintosh acceleration, Apple events support, multiple-session capability, fast drag-and-drop file transfer, keyboard mapping, extensive scriptability, and feature control tools.

Synergy Software

The VersaTerm family of applications (VersaTerm, VersaTerm-PRO, VersaTilities) provide high quality terminal emulations, TCP/IP network connections (including SLIP), and a graphical interface for exchanging information over the Internet.

Xinet

Xinet develops and markets Unix/Macintosh connectivity products. They specialize in client/server solutions that let Macintosh and Unix systems work together

efficiently and reliably. Xinet products include:

- FullPress: integrated OPI (Open Pre-press Interface) server software for prepress production.
- K-AShare: AppleShare file server software for Unix.
- K-Spool: A bi-directional print spooler for Unis and Macintosh.
- K-FS: AppleShare client software for Unix.
- MediaShare: High speed file sharing solution for prepress and media production.

AGE Logic, Formerly Pacer Software

AGE Logic is a leader in desktop connectivity software. Specializing in interoperability and connectivity software, AGE has developed a wide range of products that facilitate desktop to enterprise connectivity. AGE's family of high performance X servers are offered under the XoftWare (pronounced zoft'ware) brand name. A complete line of Macintosh to UNIX connectivity and interoperability products are offered under the Pacer brand name.

AGE's Macintosh family of UNIX connectivity products includes:

- XoftWare for Mac OS
- PacerTerm
- PacerShare
- PacerPrint
- PacerForum
- AppleTalk Technology
- DAL/ODBC Servers

Information Presentation Technologies, Inc. (IPT)

IPT's solution is based on configurations of Macintosh computers and a central UNIX database, file, print and mail server. Below are some of the IPT family of products:

- Canopi: AppleTalk file and print server including OPI.
- LessTalk: Reduces network "chatter" on AppleTalk networks.
- Partner: Allows Unix machines to be AppleTalk clients.
- TurboTalk: Speeds up netwrok transfers.
- uShare: AppleTalk file and print server.

Helios USA

EtherShare is a Macintosh file server for Unix computers running any of the standard versions of Unix, Digital, AIX RS-6000, Data General, HP, Sun OS and SGI. It integrates a high-performance file server, a print server handling PostScript protocols and an AppleTalk Internet router. It also provides terminal services and access to Unix mail.

Helios OPI is a high-performance desktop
publishing document server and printing enhancement system based on Unix computers that have been equipped with EtherShare.

Alisa Systems

AlisaMail is an easy-to-use enterprise electronic mail and corporate directory service integration system designed for demanding messaging environments that require support for standard and proprietary mail protocols. Based on Sybase relational database, its distributed architecture and comprehensive directory service make electronic message integration more reliable and simple to administer in a large E-mail environment. AlisaMail fully integrates a broad base of PC, Macintosh, Unix and DEC VAX E-mail systems. By allowing various hardware and software platforms to seamlessly and transparently exchange electronic messages, fully editable documents and binary files, AlisaMail integrates corporate E-mail with Microsoft Mail, Lotus cc:Mail, CE Software QuickMail, WordPerfect Office, X.400, SMTP and Digital's VMSmail, ALL-In-1 and Message Router (with access to PROFS, SNADS, PMDF, and so on) mail systems.

Rasmussen Software, Inc.

MacQT (Macintosh Quick Terminal) provides solid terminal emulation for any Macintosh. It emulates ADDS Viewpoint extended, with line-drawing set, attributes and function keys (emulated on minimal keyboards). It supports sizeable text, 80/132-column display, ASCII file transfer, pass-through print and pass-through PostScript. Host software is provided where necessary for file transfer.

Public Domain Software

There are several non-commercial (public domain) products that provide telnet and FTP services for the Macintosh. One of the most popular is NCSA Telnet. NCSA Telnet offers telnet and FTP (client and server) services to the Macintosh. NCSA Telnet supports MacTCP.

University of Illinois
Internet: softdev@ncsa.uiuc.edu

For people interested in doing TCP/IP programming, a MacTCP based socket library is available from the University of Toronto. This is a non-supported public domain product.

University of Toronto
Internet: milligan@utcs.utronto.ca

The Columbia AppleTalk Package (CAP) is a public domain software package that offers an AppleShare-compatible file server that can make a UNIX directory available to Macintosh users via the AppleShare client software. It also offers bi-directional print services to both the UNIX users and the Macintosh users. For spooling Macintosh files, CAP uses a UNIX program that behaves as a virtual LaserWriter, allowing any device that can print to a LaserWriter to use the spooler.

Available from several archive servers on the Internet.

A/UX 3.0: Installing on Magneto Optical Drive (9/94)

Revised: 9/21/94
Security: Everyone

A/UX 3.0: Installing on Magneto Optical Drive (9/94)

==========

Article Created: 18 June 1992
Article Reviewed/Updated: 21 September 1994

TOPIC ----------

I'm having difficulty with A/UX 3.0 and the Liberty 128 Magneto Optical.

To summarize several calls to Liberty Systems and FWB (FWB makes the Hard Disk Toolkit formatter that ships with the drive), the problem is with A/UX 3.0. According to them, 3.0 won't install on any third-party software partitioned hard drive, even if the partitions follow Apple's specifications. I must use the special version of HDSC Setup that comes with A/UX 3.0. Unfortunately, HDSC Setup won't format Magneto Opticals. FWB says there's nothing they can do; it's Apple's problem. And they say that no Magneto Optical works with A/UX 3.0.

DISCUSSION ----------

We called A/UX engineering to see which drives were tested with the Installer. There's an entry in the /etc/disktab file for a Sony E501 and it's referenced as SMOE501.

When a drive is partitioned with software other than HDSC Setup included with A/UX, the Installer assumes that the A/UX partitions are ready to have the software loaded into them. This means that the partition must exist in the partition map, be of the correct type, have a BZB (block Zero Block), and have a file system on it.

Most of the third-party disk partitioning tools create everything correctly, with the exception of the file system. The cause of the problem you describe could be the absence of a file system.

If you have this problem, here are two workarounds:

- Use HDSC SetUp that came with A/UX to create the partition.
  1) If you don't choose Easy Install in the Installer, you use Customize.
  2) Customize has 3 steps. The first one is "Prepare the Disk." Select

this step to call HDSC SetUp.
3) Choose "Partition" and then "Customize."
4) Once in the Customize screen, remove the A/UX partitions (Root, Autorecovery, Usr, and so on), and recreate them. This creates the entries in the partition map, but also creates a file system on them.
5) Exit HDSC and continue with the installation.
Note: If you run this HDSC while in the Macintosh operating system, the partitions will be created properly, but without a file system on them. So avoid running it under the Macintosh operating system unless you're prepared to create the file systems manually.

- Create the file system manually.
To create the file systems manually, you need to run the UNIX command "newfs" at a shell prompt. To get to a shell prompt you need to run the Installer in "debug" mode and quit from it.

1) Boot the system you'll be installing on with the appropriate installation disk.
2) When you get the first "A/UX Installer" screen, press Command-. (the Command key and period) to interrupt the boot process.
3) You should get a text window with a prompt "installer#." At this prompt enter the command:

```
boot_cd debug
```

This will start the installer in debug mode.

4) Once the Installer has loaded, press the "Quit" button and you'll be at a UNIX "#" prompt. At this point you need to type the command:

```
newfs /dev/dsk/c5d0s0 other
```

For this example, 5 is the SCSI ID of the drive. Replace the number 5 in the previous command with the appropriate number.

5) After this command is completed and you get your prompt back, enter

```
installer
```

and go into Custom installation. You should be able to perform steps 2 or 3.

AppleTalk: Can't Enable DDP Checksums on All Out-Going Packets

Revised: 6/30/92
Security: Everyone

AppleTalk: Can't Enable DDP Checksums on All Out-Going Packets

==========

Article Created: 18 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

From "Inside AppleTalk" 2nd Ed, Chapter on DDP, pages 4-17:

> "The DDP checksum is provided to detect errors caused by faulty operation (such as memory and data bus errors) within routers on the internet. Implementers of DDP should treat generation of the checksum as an optional feature...
>
> [algorithm for computing 16-bit checksum (CkSum)]
>
> Reception of a datagram with CkSum equal to 0 implies that a checksum is not performed."

Looking at DDP packets on our network shows that the DDP checksum is set to 0 on all packets. Is there a way to turn on DDP checksum generation and destination checking on Macintosh computers?

We also plan to AppleTalk subnet behind cisco routers. So the problem may localize to a few zones behind the cisco (usually a building or department).

DISCUSSION -----

There's no way to enable DDP checksums on an over-all basis. Individual applications can choose to implement DDP checksums, but there's no way to enable it for all out-going DDP packets.

All data link protocols such as LocalTalk, 802.3, 802.5, HDLC, PPP, SLIP, and so on, build in CRC or checksum validity routines. These checks are usually implemented in hardware, and are therefore very quick. Doing the

CRC calculation at the network layer adds a fair amount of overhead to the transaction and effectively adds CRC checking to data that has already passed a CRC check.

It's true that the data in the network part of the packet could be damaged by random bit flipping within the hardware of the router after the packets were checked by the data link layer. But this should be a rare condition (a real hardware problem with an interface card), and not just caused by random noise on a T1 line.

The CRC fields in the DDP header are meant to guard against forwarded packets. In other words, if you send a packet to Joe's Macintosh which is on the same Ethernet cable as you, then you needn't concern yourself about end-to-end data integrity because the data link layer will handle it.

On the other hand, in the case where you send a packet to Sue, and Sue's Macintosh is 10 states away, several routers could be involved, and your packet could be damaged while one of them is routing your packet across its bus or one of its interface cards. Again, this form of error checking is meant for applications that need to ensure end-node to end-node data integrity for forwarded packets, and not meant for data link layer type checking. That's a job best left up to the data link layer.

RTMP and ZIP packets are broadcast onto the local Ethernet/Token Ring/LocalTalk by routers that believe these packets are destined for nodes on this cable. For this reason, we let the data link layer handle the CRC checking for the RTMP and ZIP protocols.

The Apple Internet router doesn't generate CRC for RTMP or ZIP packets. It will honor and check CRC if it receives packets from a router that generates RTMP and ZIP packets with a valid CRC (CRC field set to something other than 0).

LaserWriter IIf and IIg: Raw, Normal, and Binary Protocols

==========

Article Created: 19 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

In reference to the LaserWriter IIf and IIg, what are the differences among the normal, raw, and binary protocols?

DISCUSSION -----

Definitions

- Raw: Lets all data pass through unfiltered. Control characters such as End-of-file (CTRL-D) and status queries (CTRL-T) are passed through and not acted upon.

- Normal: Data passing through is filtered. Control characters perform their intended function. Status queries (CTRL-T) will have a status returned; End-of-file (CTRL-D) characters will end print job.

- Binary: We took the following from pages 15 to 17 of the "LaserWriter IIf and LaserWriter IIg Printers Developer Note" (APDA R0230LL/A):

  Binary serial protocol

  LaserWriter printers support an alternate protocol for the serial communication channels. While this protocol allows all character codes to be transmitted as data, it also allows certain characters to be used for specifying control functions, which may be handled asynchronously by the communications driver. Those control functions include requesting status, aborting a job, marking ends of jobs, and controlling flow for the serial channels.

  Because this protocol can transmit any character code, it can be used for

sending PostScript language jobs that contain binary images or for sending commands with any sequence of control characters to emulators.

Because this protocol can be used for sending both PostScript language programs and emulation jobs, it provides a way of switching between the PostScript interpreter and the emulators without flushing the input buffers. The manner of switching between PostScript language programs and emulations is described in Chapter 3 of the "LaserWriter Reference".

To select the binary serial protocol, set the operating mode switch to position 6, or use the LaserWriter Utility to set one of the changeable parameter sets to use binary protocol.

The binary serial protocol requires the host computer to insert a quoting character at certain places in the data stream and to modify the character codes for certain characters. (This procedure is described later in this section.) That means that the host computer must filter the data before sending it to the printer. The filtering may be done by an application program or within the operating system of the host computer.

When the binary serial protocol is enabled, it operates on communications in both directions. Therefore, the host computer must also filter any data it receives from the printer.

There are eight control characters that are treated as control functions rather than as data when they are received by the communications driver. The control characters are defined in Table 2-1.

Table 2-1 Control characters in the binary serial protocol

Hex value	ASCII name	ASCII function	Control function
01	SOH	CTL-A	Quote data byte
03	ETX	CTL-C	Abort job and flush to end of file
04	EOT	CTL-D	End-of-job marker
05	ENQ	CTL-E	None
11	DC1	CTL-Q	XON in XON/XOFF flow control
13	DC3	CTL-S	XOFF in XON/XOFF flow control
14	DC4	CTL-T	Request printer status
1C	FS	CTL-\	None

To transmit these characters as data, they must be quoted, as follows. To quote a character, the program replaces the character with the two-character sequence consisting of CTL-A followed by the result of the exclusive-OR (XOR) of the character to be transmitted with $40 (the dollar sign indicates hexadecimal). For example, to send a byte with the value $14, a program must send the 2-byte sequence $01$54. This method of quoting guarantees that whenever any of the eight special characters is received, the control function is intended, regardless of whether the preceding character is a CTL-A. Because of that character independence, the generation and processing of asynchronous control characters can take place at a lower level than the generation and consumption of the data

stream. In particular, on the host computer, the CTL-A quoting convention can be implemented by a user program while XON/XOFF processing is performed independently by the operating system.

All byte values other than those of the eight special characters are transmitted by simply sending the value.

After a CTL-A is received, the next character received that is not one of the eight special characters must be the result of XORing one of the special characters with S40. The reception of any other character constitutes an error in the input data. Between the CTL-A and the XORed character, any number of special characters may appear, except for the special characters that are handled synchronously—CTL-A and CTL-D. Reception of CTL-A or CTL-D between a CTL-A and the XORed character constitutes an error.

When one of the special characters arrives unquoted and it specifies no control function for the channel, the character is discarded. For example, if XON or XOFF is received and XON/XOFF flow control is not in use, the XON or XOFF character is discarded. The characters CTL-E and CTL-\ currently do not specify any control functions. They are included among the characters that must be quoted in case new control functions are added in the future.

The binary serial protocol is different from the simple serial protocol in that there is no mapping between end-of-line conventions with the binary protocol. Whatever end-of-line character (<CR>, <LF>, or <CR><LF>) is sent by the host is received by the interpreter or emulator in the printer. The PostScript interpreter handles different end-of-line characters in a uniform way, but a program that reads data (by means of a read or readstring operator) receives whatever characters were sent by the host. Likewise, whatever output is generated by a PostScript program (by means of a print or = operator) is sent unchanged.

Note: The standard end-of-line character in the PostScript language, corresponding to '\n' in a PostScript language string, is <LF>.

PostScript 51.8 & Earlier: Difficulty Printing Complex Graphics

==========

Article Created: 19 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Large print jobs in Word or Excel don't seem to print out on a LaserWriter IINT, but will print out on a LaserWriter IINTX. Normally they will print to a certain point and then get "hung" for at least a half hour, and then we get a printer time-out message.

We tried printing the same documents using different Macintosh computers, different system software, and different LaserWriter driver versions. We also tried boosting memory on applications, PrintMonitor, and so on.

We tried a NetMinder LocalTalk trace, which showed the failed print job to the LaserWriter IINT. After 9 pages, there was an increased number of packets going between the Macintosh and printer, but the job never printed.

DISCUSSION -----

The problem is due to the print job being too complicated for the amount of memory in the printers, and how the version of PostScript in these printers handles graphics.

There are two possible workarounds for the LaserWriter IINT printers:

1) In Page Setup, deselect "Graphics Smoothing?" and "Faster Bitmap Printing?". This will allow the LaserWriter IINT to print the documents that have been causing the problems.

2) Upgrade the printers with LaserWriter IIf logic boards.

Apple LaserWriter printers with PostScript versions prior to 51.8, such as the LaserWriter IINTX with revision 1 ROMs (PostScript 47) and the

LaserWriter IINT (PostScript 47), experience problems when printing complex graphics. In fact, workaround option 1 doesn't work with the original LaserWriter printer.

Newer LaserWriter printers, such as the LaserWriter IINTX with revision 3 ROMs (PostScript 51.8) or the LaserWriter IIf and IIg (PostScript Level 2) are much better at handling the complex graphics that are becoming more common.

AppleShare 3.0: Improper ProDOS Pathname Error

Revised: 9/18/92
Security: Everyone

AppleShare 3.0: Improper ProDOS Pathname Error

==========

Article Created: 19 June 1992

Article Change History

09/18/92 - REVISED
- Changed title to indicate issue.

TOPIC ----------

Network Configuration:

- Classic II 4/80 file server
- AppleShare 3.0
- Macintosh Classic, LC, and LC II (At least one of the LC systems has an Apple IIe Card with IIe software version 2.1 installed.)
- Apple IIe systems with the Apple IIe Workstation Card.

If the privileges are set to "All privileges enabled" then everything works great. When "All privileges enabled" isn't allowed (OFF), we get this message on the Macintosh LC with IIe card: "This volume does not have the proper ProDOS pathname and cannot be used: (volumename)."

We have four other sites all set up the same, but using AppleShare 2.0. When my version of AppleShare 2.0 is launched on the network, the LC with IIe card works fine.

DISCUSSION ----------

The only time we could duplicate this situation was when the Share button wasn't selected in the Privileges/Access Privileges… dialog. Once the server volume was highlighted in this dialog and the Share button was pressed, the error message about ProDOS pathnames didn't appear. (When the Share button has been pressed and the volume is being shared, the Share button's label changes to Unshare.)

The procedure for using the Share/Unshare button is different in AppleShare 2.0. This difference in procedure may be causing the problem.

Once this issue is resolved you may discover a problem with the ProDOS 1.9 Selector (the menu that appears when you type "bye"). ProDOS 2.0.1 needs to be used for the Selector to work correctly with network volumes. ProDOS 2.0.1 ships with GS/OS 6.0 and should be available from various information services and bulletin boards.

AppleTalk Phase 1: Nodes Send RTMP Packets On Different Routes

==========

Article Created: 18 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

It appears as if nodes on our nonextended (Phase 1) backbone (containing many routers) don't necessarily send data destined for a different zone along the route with the shortest distance. For example, during a copy, a node starts out sending packets to one router, and then switches, sending to different routers while still sending the same file. This creates excess traffic, as the routers have to forward the packets to the proper routers.

"Inside AppleTalk" Chapter on RTMP, pp. 5-17, 5-18 says that a node may listen for RTMP data packets and update its routing tables, causing its default router to "change continually (if there is more than one router on the network)."

With so many routers on one network, are the RTMP broadcasts causing all nodes to send data along different routes?

We plan to move completely to Phase 2 this summer, so the problem may not pertain to extended networks.

DISCUSSION ----------

Your assumptions are correct. Each end node captures RTMP packets which are broadcast onto its cable segment. If you have multiple routers attached to a single cable, the end nodes will set their "AROUTER" (a low mem global) variable to the address of the router that sent the last RTMP packet. This can cause data to take a less than optimal route to its destination, but this is only true for AppleTalk Phase 1.

AppleTalk Phase 2 has an enhancement to DDP called "best route" which

allows DDP to obtain a router to a remote node and then use that route for all future data transactions for the session. See "Inside AppleTalk" 2nd edition for more information concerning best route. As you stated, this won't be a problem as soon as the network is upgraded to Phase 2.

Macintosh: Compatibility with SCSI-2 Devices (6/96)

Revised: 6/26/96
Security: Everyone

Macintosh: Compatibility with SCSI-2 Devices (6/96)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 26 June 1996

TOPIC ----------

Does any Macintosh computer support SCSI-2 either fully or partially? If not, are there any methods to add that functionality?

DISCUSSION ----------

Power Macintosh 7500, 7600, 8500, and 9500 computers

The Power Macintosh 7500, 7600 8500, and 9500 series computers partially support SCSI-2; they support Fast but not Wide SCSI. These computers have two SCSI buses: an external and internal SCSI bus. The external SCSI channel is SCSI-2 compliant but does not support Fast SCSI-2. The internal SCSI channel supports the Fast SCSI-2 standard at 10 MB per second for a hard disk array. Both internal and external buses are 8-bit only, not wide. For more detailed information about the SCSI-2 implementation in these computers, see Tech Info Library article, "Power Macintosh 7500, 8500, 9500 Series: SCSI-2 Compliance."

Other Macintosh computers

SCSI-2 commands are very similar to SCSI, but SCSI-2 is not a superset of SCSI. There is a chance a SCSI-2 drive will work on any of the Macintosh computers as long as the drive does not implement specific SCSI-2 functions (such as Fast SCSI or Wide SCSI). Since Apple does not make a SCSI-2 drive, any SCSI-2 drive would also need a device driver.

But there are other caveats too, so we highly recommend that if you want to purchase a SCSI-2 device check with the distributor for Macintosh compatibility information. The best solution for using SCSI-2 devices is to use a third-party SCSI-2 NuBus or PDS interface card. Compatibility and performance of any SCSI-2 device depends on the device itself, the interface card, and how these devices implement SCSI-2 protocols. You can get Information on compatibility from the third-party companies that supply these products.

SCSI Manager 4.3

SCSI Manager 4.3 helps provide additional SCSI-2 support on Macintosh computers, but it does not provide full SCSI-2 support. The Macintosh Quadra 660AV/840AV and Power Macintosh computers contain SCSI Manager v4.3 in their ROMs. Other Macintosh computers can take advantage of SCSI Manager 4.3 through the SCSI Manger 4.3 extension. This software is part of System 7.5 and is also available from online services Apple provides software updates to.

The additional SCSI-2 support provided though SCSI Manager 4.3 is still a limited implementation of SCSI-2. SCSI Manager 4.3 among other things, provides support for SCSI-2 messages and protocol actions.

What SCSI Manger 4.3 Provides

The SCSI Manager v4.3 is fully asynchronous, allowing each of several devices to have multiple requests outstanding. By queuing requests in this manner, it improves overall throughput. Other features such as DMA (Direct Memory Access) support, further enhance overall performance. It improves functionality through support for multiple buses and hardware configurations, and as mentioned above, support for SCSI-2 messages and protocol actions.

Article Change History:
26 Jun 1996 - Added additional computer model.
04 Jan 1995 - Added information about new Power Macintosh computers.
26 May 1995 - Added additional information on SCSI Manager 4.3.

Frame Relay: Overview, and Sending AppleTalk Packets

==========

Article Created: 25 June 1992

Article Change History

11/03/92 - CORRECTED
- The vendor search string information

TOPIC ----------

Can I send AppleTalk packets via frame relay technology from AT&T or WilTel?

DISCUSSION ----------

Summary

Yes, you can send AppleTalk packets via frame relay, but you need to consider many factors that may adversely affect AppleTalk performance across frame relay.

First, there's no guaranteed maximum time delay between frames. This could significantly affect performance/usability of some AppleTalk-based services. AppleTalk services have many time-dependent functions that are hard-coded to a very low value and may fail in the presence of long frame delay times.

Second, frame relay has no recovery/re-transmission mechanisms to allow it to recover from lost frames. This forces the recovery mechanism to the higher level services (AppleTalk in this case), which may not be tuned for re-transmissions on such data links. The AppleTalk ATP TRel timer is a perfect example of this problem. If a TRel packet was lost while in transit across the frame relay network, you'd be forced to wait at least 30 seconds before the recovery process completed.

The third problem with frame relay and AppleTalk is related to the second problem, but with a slightly different slant. Frame relay supports the ability to drop packets in order to adjust the data stream for congestion reasons. For AppleTalk, this can lead to the same types of problems discussed in the last example.

Several router vendors (ACC, cisco, Coral, Network Equipment Technologies, Newbridge, Proteon, 3Com, and Wellfleet all currently offer AppleTalk routing services over frame relay.

We're not sure whether anyone has extensively tested AppleTalk over frame relay.

Frame Relay Compared to X.25

Frame relay is a packet-switching data link technology which can be thought of as a close cousin to present day X.25. Frame relay defines an interface, or access protocol, between two data communications devices. It operates at line speeds up to 2.048 Mbits/sec and can accommodate the bursty nature of LAN traffic without wasting link capacity or causing significant average delay.

Compared to the X.25 protocol, frame relay is a streamlined approach to wide-area packet switching and provides superior performance by eliminating the X.25's inherent overhead. Frame relay is also faster than X.25 because it uses the fidelity and reliability of modern digital facilities; the access speeds of frame relay can reach 2 megabytes per second, compared to 64,000 bytes per second for X.25.

Defined by ANSI, frame relay is a packet-mode service in which data is organized into individually addressed units. As a result, it retains the statistical multiplexing capabilities of X.25; multiple data streams can be multiplexed over a single serial line, allowing for port-sharing. However, frame relay eliminates most of the other X.25 functions. Frame acknowledgment, automatic retransmission in case of errors, and other X.25-like capabilities are handled by higher-layer protocols, such as TCP/IP and OSI Transport Class 4, in the source and destination devices. By essentially restricting its role to multiplexing and routing, frame relay is able to operate more efficiently -- and therefore more quickly -- than X.25.

Frame Relay Limitations

Because it is a stripped-down protocol, frame relay has certain limitations. It doesn't have error handling and flow control, so frame relay needs an error-free transmission path, such as a digital carrier circuit or fiber-optic span, and intelligent higher-layer protocols in the devices at each end of the connection. Although it recognizes transmission errors through a standard CRC, frame relay discards data with errors as well as excess packets that result from network congestion. Frame relay discards these frames without notifying the sender that they need to be retransmitted.

As with X.25, frame relay allows for frames of variable length, so the delay that network traffic encounters will vary. Because of this, frame relay isn't suitable for delay-sensitive traffic such as voice and compressed video.

Another important factor to consider is the service provider's committed information rate (CIR), usually available for each virtual circuit established.

Frame-relay data communications networking services are appealing due to their relatively low cost, but their burst-mode transmission makes reliability a big issue. Users are greatly concerned about the performance and quality of their wide area network (WAN) and local area network (LAN) communications systems. In bursty transmissions, congestion is a crucial concern, for the networks have the potential to become over-burdened if many users on a public frame-relay network send a lot of data at the same time.

Early frame-relay users, many of them customers of WilTel Communications Systems, Inc. and other large carriers, currently operate without a lot of traffic management control on their systems. WilTel has approached the issue conservatively, engineering its network so that users can't transmit at speeds above a certain level unless their burst is momentary. This approach is considered inefficient by some, due to the slim chance that WilTel's customers would all transmit at once.

Frame Relay NuBus Card Information

Multiaccess Computing Corp. offers a 1.544-Mbps frame-relay NuBus card that can be upgraded to SMDS. This is for users who want fast wide-area networks now, but hesitate to upgrade to not-ready-for-prime-time Switched Multimegabit Data Service. The MCC-1000F card lets you connect to frame-relay services expected from the regional Bell operating companies, AT&T Co., MCI, Sprint USA, or other interexchange carriers.

Frame relay is a technology that links remote network sites by dedicated virtual circuits, allowing access to multiple sites through a single physical connection. To speed transmission, it assembles network packets in super packets called frames, and routes them across a telephone network to remote sites. The technology offers a high-speed, expandable WAN environment, because it's easy to add new sites by subscribing to the same frame-relay service.

Multiaccess will ship software with the MCC-1000F card that provides AppleTalk-to-frame relay translation. Network resources, such as printers and servers, connected to a Macintosh by frame relay will appear in the Chooser as though they were on a local network. The MCC-1000F also supports applications that use Apple's MacTCP TCP/IP communications stack to access network resources. The card includes an integrated CSU/DSU (Channel Service Unit/Data Service Unit), hardware that provides the physical interface to long-haul digital telephone lines.

To locate a vendor's address and phone numbers, use the vendor name

as a search string.

Macintosh: Localizer Tool for International Resources

Revised: 11/11/92
Security: Everyone

Macintosh: Localizer Tool for International Resources

==========

Article Created: 19 October 1992

TOPIC ----------

I'm interested in finding software for remapping the keyboard for German, and other languages.

DISCUSSION ----------

The software you need is called the Localizer, a development tool that enables you to install the country-specific international resources you desire: keyboard mapping, sorting order, International resources for such things as the proper currency indicator or format, date and time convention, proper Bundle resources, and so on. And after you've used the Localizer, your system file defaults to the keyboard and international resources of the version you selected.

System 6 and System 7 versions of the Localizer are available on the E.T.O., the "Essentials • Tools • Objects" CD-ROM. This subscription CD contains almost every major Macintosh software development tool created by Apple. The subscription for E.T.O. gives you four CDs per year, is available from APDA, and is targeted to software developers.

The Localizer is not posted on AppleLink or commonly available elsewhere, because Apple usually doesn't make localized software available outside of the target market for a number of good reasons. The Localizer is made available on the E.T.O. CD because our developers are creating software for use in multiple countries.

Another way to obtain localized software is to purchase it in the country where it's distributed. Use ResEdit to copy (from a copy of localized software) those specific resources needed, such as the appropriate KCHR, itlk, and kcs resources. Or subscribe to "develop," a quarterly periodical that includes a CD called Developer Essentials. On the Developer Essentials CD is virtually every current localized operating

system Apple distributes. That subscription is from APDA, and is also targeted toward developers.

Serial Switch: Using with Quadra 900 and 950 (5/95)

Revised: 5/18/95
Security: Everyone

Serial Switch: Using with Quadra 900 and 950 (5/95)

==========

Article Created: 29 June 1992
Article Reviewed/Updated: 18 May 1995

TOPIC ----------

I found that some third-party MIDI software requires running Serial Switch for the Quadra to work correctly. The switch is in the MIDI Manager Tools Diskette from APDA.

What is this serial switch, and how does it differ from the IIfx serial switch?

DISCUSSION ----------

As you surmise, the Macintosh IIfx, Quadra 900, and 950 all have intelligent I/O processors (IOPs) on the ports for the floppy disk, ADB, and serial I/O. These ASICs feature a built-in microprocessor, DMA controller, timer, and external Static RAM (SRAM), used to off-load floppy disk, ADB, modem, and printer port interrupts.

Those programs that don't use the I/O ToolBox routines, but instead directly address the I/O hardware (contrary to our programming recommendations) will have compatibility problems with these IOP-equipped systems. However, Apple wrote a utility called the Serial Switch that overrides the IOP controlling the serial ports, to help make compatible those applications that write directly to the serial hardware.

The first utility was called the Macintosh IIfx Serial Switch 1.0, which was revised and renamed to Serial Switch, to better reflect that it may also be used on the Quadra 900 and 950.

This newer version of the Serial Switch hasn't been as widely distributed as the previous version because most of the third-party incompatibilities have long since been corrected. But since there are still third parties who wish to use their own serial drivers, most notably MIDI developers, Apple provides the switch to developers to distribute with their applications should their applications require it.

NOTE: The latest version of the Serial Switch is 1.1. After launching it, you will read ver 1.1a1 in the top right corner of the switch's window.

The CDEV has two modes:

• Faster - When using the IOP.

• Compatible - Enables third-party developer's code to address the SCC hardware directly, bypassing the IOP.

NOTE: You will have to restart your computer after choosing a different mode for the change to take affect.

Since there's no way to bypass the IOP that controls the SWIM and ADB, applications that address that hardware must be modified to work on the Macintosh IIfx, Quadra 900, or Quadra 950.

You can obtain the Serial Switch from the MIDI Manager Tools Disk as you mention, as well as from:

• The E.T.O. CD (sent to developers on a subscription basis)
• Software Licensing
• AppleLink in Software Sampler

Note the Serial Switch is still sometimes referred to as the "Macintosh IIfx Serial Switch"; however, regardless of the name, version 1.1 will work on Quadras too.

Bernoulli Drive: Using as A/UX Volume

Revised: 6/30/92
Security: Everyone

Bernoulli Drive: Using as A/UX Volume

==========

Article Created: 29 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I'm using a Bernoulli 90MB dual cartridge drive with A/UX 3.0.
I'd like to use the second drive as a UNIX volume. Can you give
instructions on how to do this?

DISCUSSION -----

The SCSI driver supports 32 partitions per drive. This means we can put partitions 0-30 on the drive and use 31 to access the whole device. For a SCSI ID with more than 2 disks, the second disk can be addressed with the next set of 32 partitions; this is 32-63, using 63 to access the whole device. The devices for the needed partitions must be created in the /dev/dsk and /dev/rdsk directories. For consistency sake, use the following format for the names — /dev/dsk/cCdDsS where:

C is the SCSI address of the drive — the whole Bernoulli box.
D is the disk number — In the case tested, 0 was left and 1 was right.
S is the slice number — For drive 0 from 0 to 31, for drive 1, 32-63.

The same format applies for the character devices in /dev/rdsk.

Create Devices

Devices must be created for the second disk. The SCSI driver major device numbers range from 24 through 30 and correspond to SCSI addresses 0 through 6. For the purpose of example, we'll assume the SCSI address is 5, making the major device number 29 (since 0=24, 5=29). Therefore, based on the above paragraph and the information we know about major device numbers, we will create devices for the second disk as follows, using the mknod command.

- To access first partition:

  mknod /dev/dsk/c5d1s32 b 29 32 – creates block device file with major device number 29 and minor number (partition start number) 32

  mknod /dev/rdsk/c5d1s32 c 29 32 – creates character device file with major device number 29 and minor number (partition start number) 32

- To access whole disk:

  mknod /dev/dsk/c5d1s63 b 29 63 – creates block device file with major device number 29 and minor number (whole partition number) 63

  mknod /dev/rdsk/c5d1s63 c 29 63 – creates character device file with major device number 29 and minor number (whole partition number) 63

  *Note: You could use:

     mknod /dev/dsk/c5d1s0 29 32

  and access the device using slice number 0.

Format The Bernoulli Cartridge

Now you need to format the Bernoulli cartridge with an A/UX partition on it with SilverLining, CMS Utilities, or something with similar capabilities.

Make sure that when the software created the partition it created a bzb block (Block Zero Block) for that partition. If it's there, you'll see some information at the end of the entry for that partition that says something like:

  Made: [0]
  Mount: []...etc

If this is there, then check that it has a slice specified. If it doesn't, you'll have to modify the bzb for that partition using the dp command. Be sure you define the A/UX partition as Slice 0 when you created the partitions. (This is the only slice number you can access if you use 32.)

Use the dp command:

  dp /dev/rdsk/c5d1s63

and look at the partition map. You can use a 'P' (capital P) in order to print all the partitions in the drive. The A/UX partition you're trying to use should have a slice number associated with it. If it doesn't, you will need to assign one to it using the dp command. Be very careful with dp, since it can trash your whole partition map very easily if you type the wrong command.

Create A File System

Once you have the A/UX partition, you can use the newfs command to create a file system on the cartridge, and then mount it with the mount command.

Be sure to test that the device you're accessing is the correct one. You can use:

```
dd if=/dev/dsk/c5d1s32 of=/dev/null
```

If disk 0 is accessed, something is wrong; don't execute the newfs command. If the disk 1 flashes, everything is OK. A good precaution is to remove the disk from drive 0 before any testing, and replace it with an empty disk (or a disk with contents you don't care to keep) in drive 0.

LaserWriter IIf & IIg: HP PCL 4+ Emulation Font Support

==========

Article Created: 9 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

The LaserWriter IIf and IIg support HP PCL 4+ emulation. What fonts and font cartridges does this emulation support?

DISCUSSION -----

The LaserWriter IIf and IIg support all built-in HP fonts in some capacity.

The LaserWriter IIf and IIg HP LaserJet IIP emulation does not provide any of the fonts available in HP Font cartridges. However, you can download HP fonts to the printers while they are in HP LaserJet IIP emulation mode in the same way as it is done on the HP LaserJet IIP.

For a discussion on the differences between the HP LaserJet IIP and the HP LaserJet IIP emulation provided by the LaserWriter IIf and IIg, refer to the "LaserWriter IIf and IIg Owner's Guide" (pages 105 through 108).

Display Card 8•24 GC: Control Panel 7.0.1 Corrects Problems

==========

Article Created: 23 June 1992
Article Reviewed/Updated: 30 September 1994

Topic ----------

The software control panel "8•24 GC" that ships with the Macintosh Display Card 8•24 GC enables graphics acceleration with the card.

Apple has identified a bug in version 7.0 of the "8•24 GC" control panel. Although graphics are accelerated, the overall system slows because the cache is disabled. Performance is not enhanced, and in some cases performance is degraded.

Discussion ----------

Which systems are affected?

The problem affects Macintosh 68030-based systems -- specifically the Macintosh IIcx, IIci, IIsi, and IIfx -- with Macintosh Display Cards 8•24 GC installed.

IMPORTANT NOTE: In 68040-based systems, the Macintosh Display Card 8•24 GC disables acceleration. Apple continues to recommend that Quadra owners use the on-board video. The 8•24 GC control panel is not designed for use with 68040-based systems.

What is the fix?

The fix is a new control panel: "8•24 GC" version 7.0.1. The new control panel fully supports System 7 (with or without 7.0 Tune-Up), and corrects the data cache problem in 68030-based Macintosh systems.

System requirements

To use version 7.0.1 of the "8•24 GC" control panel, you need:
• System 7.0 or greater (do not use System 6.0.x).

• At least 3MB RAM.

Installation

Here's how to install "8•24 GC" 7.0.1 in a 68030-based Macintosh.

1) Drag the "8•24 GC" icon into the System folder on your startup disk.
   System 7 will place it in the Control Panels folder for you.

2) Restart your Macintosh. A picture of a rocket will move
   up your screen, indicating that the software has been
   installed correctly and acceleration is enabled.

   If the rocket does not move up your screen, appearing instead with
   a red line through it, there has been a problem installing the
   software. Check your Display Card 8•24 GC manual for
   troubleshooting information.

MacTCP Token Ring Extension: Overview

Revised: 1/6/93
Security: Everyone

MacTCP Token Ring Extension: Overview

==========

Article Created: 22 June, 1992

Article Change History

01/05/93 - REVIEWED
•For technical accuracy

TOPIC ---

This article is an overview of the MacTCP Token Ring Extension product.

DISCUSSION ---

Introduction

This product is for customers who have standardized on TCP/IP over Token Ring. Apple's MacTCP has come standard with TCP/IP services over LocalTalk -- EtherTalk and Ethernet. However, MacTCP has the documented ability to incorporate Alternate Link Access Protocol (ALAP) modules much like System 7 uses extensions. With the MacTCP Token Ring Extension, Apple adds Token Ring to its list of supported TCP hardware platforms.

Hardware Requirements

• A Macintosh computer system with a Token Ring card.

Software Requirements

• The Token Ring card must use a driver that conforms to the .TOKN specifications, as do Apple's Token Ring cards and some third-party cards. (Apple's original 4M/s Token Ring card shipped with an incompatible driver. If you have one of these cards, you must install the .TOKN driver before using the MacTCP Token Ring Extension.)

• System 6.0.5 or later, and MacTCP 1.1 or later.

Installation
---

1) Use the latest Network Software Installer disk (NSI 1.2.1 or later), which installs the proper driver for your card.

2) After installing the driver, drag the MacTCP Token Ring Extension to the System Folder. (System 7 will place the extension into the Extensions Folder.)

3) Open the MacTCP Control Panel. (Depending on the hardware installed in your Macintosh, you'll see from 1 to 7 MDEVs, the MacTCP Devices seen in the upper section of the MacTCP Control Panel.) Click on the Token Ring MDEV.

   If you have more than one of a particular type of network card, MacTCP will place a reference number in parenthesis under each MDEV. The MacTCP Token Ring Extension manual explains how to convert the reference numbers into NuBus slot numbers for your particular Macintosh.

The rest of the configuration process is no different than the standard MacTCP configuration process, fully described in the manual.

KanjiTalk 6.0.7, 6.0.7.1: Kanji TrueType Upgrade Kit

==========

Article Created: 30 June 1992

Article Change History:

09/14/92 - REVIEWED
- for technical accuracy.

TOPIC ----------

This article provides information about the Kanji TrueType Upgrade Kit.

DISCUSSION ----------

Overview

TrueType is a unique outline font format developed by Apple Computer, Inc. It guarantees that, if your document looks good on your screen, it'll look even better in print. Unlike conventional fonts, which use bitmapped images, TrueType fonts offer a high quality print from any Macintosh computer and Macintosh-compatible printer.

There are several TrueType font families included with the Kanji TrueType Upgrade kit. The four Roman font families are Times, Helvetica, Courier, and Symbol. The Japanese font families include HonMincho and HeiseiKakuGothic. Like the conventional bitmap fonts, TrueType fonts need to be installed only on the Macintosh and not on the printer.

Installation

Installing TrueType fonts is easy. The Kanji TrueType Upgrade comes with an installation disk that installs the fonts directly into an existing KanjiTalk 6.0.7 or 6.0.7.1 System file. Use the Easy Install option to install both fonts, or if hard drive space is limited, use the Customize option to install only one of the Japanese fonts.

The Fonts

Two Japanese TrueType fonts are included with the Kanji TrueType Upgrade. Their names and characteristics are described here.

HonMincho-M is a TrueType Mincho-style font that allows high quality print on any Macintosh-compatible printer, including the Apple StyleWriter and the Personal LaserWriter LS. This font was developed by Ryobi Imagix in Japan and adapted for TrueType by BitStream, Inc., in the U.S.

HeisaiKakuGothic is a TrueType Gothic-style font that produces high quality print on any Macintosh-compatible printer, including the Apple StyleWriter and the Personal LaserWriter LS. The single-byte Roman and half-width (hankaku) kana characters in this font are non-proportional, enabling computer communications and data transfers to and from non-Macintosh word processors. This font was developed by the MITI Font Development and Promotion Center with participation from more than 60 companies.

Drivers

The Kanji TrueType Installer places a new set of printer drivers for the StyleWriter and Personal LaserWriter LS in your System Folder. These drivers have been optimized, allowing your computer to print faster than was previously possible when using a TrueType font.

Cache and Memory

The Kanji TrueType Upgrade kit contains a new technology that automatically stores your most recently used characters in a font cache as you use your system. This lets the computer access your frequently used characters quickly and easily. As the cache continues to fill, the speed of rendering characters on the screen and printing them increases.

System Requirements

Due to the large number of characters in each Japanese font (close to 7000 in JIS Level-2), Japanese TrueType fonts require more memory space than Roman fonts. This makes it impossible to install more than a few Japanese fonts in your System at one time. Apple Computer, Inc., recommends the following minimum system configuration for installation and use of the Kanji TrueType Upgrade:

- 4MB RAM
- A floppy disk drive capable of reading high-density (1.4MB) floppy disks
- A hard drive with at least 15MB of available space, or 10MB of available space if you are installing only one font
- KanjiTalk 6.0.7 or 6.0.7.1, pre-installed on the hard drive

For More Information

To find out more about Kanji TrueType, contact an authorized KanjiTalk dealer in your area.

For a list of authorized KanjiTalk dealers in the U. S, search the Tech Info Library under "KanjiTalk and dealers", or contact the Apple Dealer Location Operator at 800-538-9696.

GS/OS 5.0.4: Difficulty Downloading ImageWriter Emulator

Revised: 11/3/92
Security: Everyone

GS/OS 5.0.4: Difficulty Downloading ImageWriter Emulator

==========

Article Created: 20 October 1992

TOPIC ----------

I'm printing to a Personal LaserWriter NT from an Apple IIGS running GS/OS 5.0.4. When downloading the ImageWriter emulator, the system on Apple IIGS freezes and the Personal LaserWriter NT just blinks. The emulator downloads fine (takes about 1.5 minutes) to a LaserWriter IINT or IINTX.

DISCUSSION ----------

If you're downloading the ImageWriter emulator from floppy disk, the following information explains the probable reason for your problem.

While the Apple IIGS is reading data (the IWEM file) from the floppy, interrupts are disabled. The Personal LaserWriter NT responds faster than other LaserWriter printers for additional packets. Usually the Apple IIGS has interrupts disabled when the Personal LaserWriter NT makes this request, so it's ignored. Eventually, the Personal LaserWriter NT makes the request again and the Apple IIGS sends the next packet of data and then reads (and disables interrupts) again. The timing of the whole thing is such that it takes a very long time to download the IWEM from floppy. From a hard disk there is no problem.

This is fixed in GS/OS 6.0: the entire file is read into memory at the beginning of the download.

Finder: How It Updates Remote Windows

Revised: 7/13/92
Security: Everyone

Finder: How It Updates Remote Windows

==========

Article Created: 10 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I have some questions about how the Finder does live updates for windows showing the contents of remote directories (for example, a folder on a file server).

Does the Finder do some type of periodic polling? If so, how often? What performance impact does this have on the local machine and the network?

RESPONSE ----------

The Finder periodically (approximately every 10 seconds), checks and updates open windows from remote servers.

The key facts here are that the Finder checks to see if a window needs updating, and it does this only for windows currently open on the desktop.

When an update is necessary, you see double arrows flashing at the left end of the menu bar as the Finder retrieves the necessary information from the server. This information includes icons to be displayed (depending on view chosen), disk space used, number of files in the folder, and, of course, filenames of new files.

The impact the retrieval of this information has on a network is typically minimal. There is not enough information being retrieved to generate a large number of packets.

The retrieval of this information can have an impact on the performance of the local machine. If network access to the server is slow -- whether due to traffic or a slow link (such as serial-based) -- the Finder will be locked into this updating process, and your machine will be unavailable

until the update is completed. Normally, this is not an issue, but slow links, high-traffic networks, multiple remote volumes mounted, or lost packets can delay the update enough to be noticeable.

The worst case scenario would be lost packets, which could add a delay of approximately 2 seconds to the update process. Although this would be unusual, if it happens repeatedly, you should search for the cause of the lost packets because this indicates a larger network problem.

With System 7, you can choose a particular configuration for your views (via the Views control panel) that improves performance of Finder updates. In List Views, deselect the "Calculate folder sizes" option and select the smallest icon size for the best performance.

AppleTalk Remote Access and Hayes InterBridge: Problem and Fix

==========

Article Created: 10 July 1992

Article Change History

11/03/92 - CORRECTED
. The vendor search string information

TOPIC ----------

This article describes
- a problem with AppleTalk Remote Access (ARA) and Hayes InterBridges with internal ROMs earlier than version 2.15, and
- the fix.

DISCUSSION ----------

Problem

When you are locally connected to an AppleTalk internet that has a Hayes InterBridge, all devices connected to that internet appear as expected in the Chooser. However, if you call in to a Macintosh on that same internet via ARA and select the Chooser, you will see a zone box but no zones -- and you can't choose any devices.

The routing information is not being handled correctly by the InterBridge. The InterBridge understands how to handle short-packet formats, but not long-packet formats, which ARA uses.

This problem is most prevalent with the oldest versions of the Hayes InterBridge (Phase 1 only), although the version that supports Phase 2 also exhibits the problem.

Fix

Upgrade to Hayes InterBridge ROM version 2.15, which Hayes Engineering says

fixes the problem.

Hayes is offering its customers a ROM upgrade at minimal cost. Contact Hayes Customer Support directly for information about their upgrade program.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Sending Print Job:A Comparison Between LocalTalk & Direct Serial

Revised: 7/9/92
Security: Everyone

Sending Print Job:A Comparison Between LocalTalk & Direct Serial

==========

Article Created: 29 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

How can I determine the time difference between sending a print job from an MS-DOS computer to a Personal LaserWriter NTR via a serial port connection and an via an AppleTalk connection?

DISCUSSION ----------

Using 50K of data as an example, and assuming that you have a theoretically perfect AppleTalk network using LocalTalk (230 Kbaud per second) with no other traffic, it takes approximately 2 to 3 seconds to send 50K over an AppleTalk/LocalTalk network to another node, once the communication has been established with that node.

An AppleTalk Printer Packet consists of 617 bytes per packet, which equals 586 bytes of data and 31 bytes used for overhead. To determine how long it takes to send the 50K of data, use these calculations:

1) Calculate the number of packets needed by dividing the number of data bytes to be sent by the number of data bytes per packet.

   50,000 bytes divided by 586 bytes = 86 packets required

2) Multiply the number of overhead bytes by the number of packets.

   31 bytes x 86 = 2666 bytes of overhead

3) Convert the number of data bytes and overhead bytes to bits by multiplying each number by 8 (8 bits per byte).

   50,000 bytes x 8 = 400,000 bits of data

2,666 bytes x 8 = 21,328 bits of overhead

4) Calculate the total information to be sent by adding the data bits to the overhead bits:

   400,000 (data) + 21,328 (overhead) = 421,328 bits of information.

5) Calculate the time it'll take to send the total bits of information by dividing that number by 230,400 bits per second (LocalTalk speed).

   421,328 divided by 230,400 = 1.8 seconds

It takes about 8 seconds to send the same 50K of data through a direct serial connection at 57.6 Kbaud (8 data bits, 1 Stop bit, and so on).

At the 50K data level, there isn't an appreciable difference in the amount of time it takes to send the information to the Personal LaserWriter NTR. However, as the print jobs get larger, the time savings would be noticeable. For example, a 50-page document at 50K per page would take approximately 3 minutes longer to send via a serial connection.

Keep in mind that these calculations don't take into consideration the amount of time necessary for the printer to process the job. Much of the time required during the printing process is the actual time the printer requires to process the page. And, depending on the type of print job (text or graphics) being processed, the printer may not be able to process the entire job at once and may need to process the job in chunks page by page.

Macintosh Quadra and PageMaker 4.0 & 4.01: Incompatible Filters

==========

Article Created: 26 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

PageMaker 4.0 is not working on my Macintosh Quadra with cache enabled.

DISCUSSION ----------

Aldus reports that PageMaker 4.0 and 4.01 work on the Macintosh Quadra with cache enabled, if you are not using these filters, which are incompatible:

- Smart ASCII Import
- Smart ASCII Export
- Word 4.0 Import
- Story Importer
- RTF Imported

Aldus said that PageMaker 4.02 is 32-bit clean and fully compatible with the Macintosh Quadra with cache enabled. However, the Story Importer was renamed, so you must manually remove the older version or you may experience a crash with an Error 15.

PowerBook: Connor 2.5-Inch 40MB Hard Drive Specifications

==========

Article Created: 26 June 1992
Article Reviewed/Updated: 3 August 1992

This article provides the specifications of the Connor 2.5-Inch 40MB Hard Drive used in the Macintosh PowerBook 140, 145, and 170.

SPECIFICATIONS

Capacity

Formatted Data Capacity:	40MB
Data Surfaces:	4
Heads Per Surface:	1
Block Size:	512 bytes
Total Disk Blocks:	82,020

Characteristics

Average Seek Time:	20 milliseconds
Transfer Rate:	Greater than 1.5MB/sec
Rotation Speed:	3,333.3 RPM
Startup:	10-15 seconds
Spindown:	5-10 seconds

Physical

Form Factor:	2.5 inch (19 mm)
Weight:	2.09 kg (4.6 lbs) (internal configuration)

Environmental

Temperature:	
(Operating)	5 degrees C to 55 degrees C
(Non-Operating/Storage)	-40 degrees C to 65 degrees C

Relative Humidity:

(Operating)	10-90% non-condensing

Power Requirements

Voltage:	5V DC with tolerance of +/-5%	
Power Draw:		
(Startup)	1.110 amps (max.)	
	5.00 watts (max.)	
(Idle)	0.260 amps (mean)	0.300 amps (max.)
	1.30 watts (mean)	1.50 watts (max.)
(Shutdown)	0.080 amps (mean)	0.100 amps (max.)
	0.40 watts (mean)	0.50 watts (max.)

These limits include 1K ohm pull-up resistors on all signal lines.

QuickMail: Use Installer 2.5 or Later With System 7

==========

Article Created: 26 June 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I am trying to install QuickMail on my Macintosh Quadra running System 7 using QuickMail Installer 2.2.3, but the installation fails. I was using QuickMail on another Macintosh running System 7 before I moved up to the Macintosh Quadra.

DISCUSSION ----------

You need to use QuickMail Installer 2.5 or later. QuickMail Installer 2.2.3 is not compatible with System 7.

Notes from CE Software:

- In many instances, users running system software version 6.X used QuickMail Installer 2.2.3. When they upgraded to System 7, the QuickMail INITs and CDEVs were moved into the correct locations. However, this is not the case when you try to install QuickMail, using the Installer 2.2.3, on a Macintosh already running System 7.

- Workstations running QuickMail 2.5 or later are incompatible with servers running versions earlier than 2.5.

To locate a vendor's address and phone numbers, search on the vendor's name.

PowerBook: Error -39 May Be Corrupted Fax Monitor Pref File 6/92

Revised: 5/16/94
Security: Everyone

PowerBook: Error -39 May Be Corrupted Fax Monitor Pref File 6/92

==========

Article Created: 29 June 1992

TOPIC ----------

I'm using a Macintosh PowerBook 140. When I try to install a new cover page using the Fax Cover application, I get an error -39.

DISCUSSION ----------

The -39 error is an end-of-file error that can be caused by a corrupted Fax Monitor Pref file.

The Fax Monitor Pref file stores the Fax Cover Library information, which includes the name and path information of the Fax Cover files. This file can be corrupted if the system encounters an error during creation or modification of the file.

To correct the problem:

1) Remove the Fax Monitor Pref file from the Preferences folder in the System Folder.

2) Run the Fax Cover application to reinstall the cover pages into the Fax Cover Library.

The Fax Cover application creates a new Fax Monitor Pref file.

You should now be able to fax a document with the Fax Sender and select your cover pages.

Kerberos: Security Authentication Software

Revised: 7/14/92
Security: Everyone

Kerberos: Security Authentication Software

==========

Article Created: 10 July 1992
Article Last Reviewed: 7 August 1992
Article Last Updated:

TOPIC ----------

Have you heard of a program called Kerberos? It's somehow being used in conjunction with Informix at one of my accounts.

DISCUSSION ----------

We found this information on Kerberos in the Internet RFC (Request for Comment). We should point out that A/UX and Macintosh OS do not support this authentication system.

From Site Security Policy Handbook Working Group RFC 1244

3.9.6 Authentication Systems

Authentication refers to the process of proving a claimed identity to the satisfaction of some permission-granting authority. Authentication systems are hardware, software, or procedural mechanisms that enable a user to obtain access to computing resources. At the simplest level, the system administrator who adds new user accounts to the system is part of the system authentication mechanism. At the other end of the spectrum, fingerprint readers or retinal scanners provide a very high-tech solution to establishing a potential user's identity. Without establishing and proving a user's identity prior to establishing a session, your site's computers are vulnerable to any sort of attack.

Typically, a user authenticates himself or herself to the system by entering a password in response to a prompt. Challenge/Response mechanisms improve upon passwords by prompting

the user for some piece of information shared by both the computer and the user (such as mother's maiden name, etc.).

3.9.6.1 Kerberos

Kerberos, named after the dog who in mythology is said to stand at the gates of Hades, is a collection of software used in a large network to establish a user's claimed identity. Developed at the Massachusetts Institute of Technology (MIT), it uses a combination of encryption and distributed databases so that a user at a campus facility can login and start a session from any computer located on the campus. This has clear advantages in certain environments where there are a large number of potential users who may establish a connection from any one of a large number of workstations. Some vendors are now incorporating Kerberos into their systems.

It should be noted that while Kerberos makes several advances in the area of authentication, some security weaknesses in the protocol still remain.[1]

MacTerminal 3.0: Emulate VT320 Function Keys with VT320 Tool

Revised: 7/24/92
Security: Everyone

MacTerminal 3.0: Emulate VT320 Function Keys with VT320 Tool

==========

Article Created: 15 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm using MacTerminal to access a VAX program. I want to map or redefine the function keys to send the VAX program specific escape sequences. Is there any way to do this using MacTerminal 3.0 with the VT320 terminal tool?

DISCUSSION ----------

According to the VT320 Tool section in the MacTerminal 3.0 User's Guide, there are three ways to emulate the functions provided by the function keys on the VT320 keyboard:

1) Regardless of the keyboard you have, the Keys menu provides selections that function identically to VT320 function keys.

2) In addition, the Extended ADB keyboard contains Function keys you can use to emulate the VT320 function keys. However, the Extended ADB keyboard contains Function keys F1 through F15, while the VT320 keyboard contains Function keys F6 through F20. The discrepancy is resolved by mapping Fx on the Extended ADB keyboard to F(x+5) on the VT320. For example, to generate a VT320 F6, use F1 on the Extended ADB keyboard.

3) You can also generate Function keys on the Macintosh keyboards by using the Keypad keys in combination with the Option key as shown below:

Macintosh keypad	plus OPTION equals	Function keys
Clear		F5
=		F6

/	F7
*	F8
7	F9
8	F10
9	F11
-	F12
4	F13
5	F14
6	F15
+	F16
1	F17
2	F18
3	F19
.	F20

For user-defined VT320 function keys, hold down the Shift key and the Option key while pressing the appropriate keypad key.

MacX: Copy Text (Not Bitmap Format) and Paste to Application

==========

Article Created: 15 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I'm using MacX, but can't cut text from an Xterm client. I'm using PATHWORKS, and I'm using a VT100 Xterm window. I'd like to have the text in ASCII instead of the bitmap displayed on the screen, so I can use it in something like Excel. Is it possible to write to the MacX command output window when the copy is made in the DECterm X session?

DISCUSSION ----------

MacX has the ability to copy things to the Clipboard in the following ways:

• It can copy the screen or portions of it as a bitmap.

• It can copy text and put it in the Clipboard as text.

To copy text, just select the text, and it will automatically be placed in the Clipboard. In other words, if you select text from an Xterm window, and then switch from MacX to TeachText, you can paste the selected text without using a Copy command

One exception to this procedure is the DECterm client. If you are using DECterm, you must:

1) Select the text you want to copy.

2) Use the menu entry.

3) Copy from the DECterm edit menu and wait until the text is deselected before it appears in the Clipboard.

..TIL10439-MacX-Copy_Text_Not_Bitmap_Format_and_Paste_to_Application.pdf

If you use the menu entry, Copy screen to Clipboard, under the Window menu of MacX, it will place data in the Clipboard in bitmap format.

VITAL (Virtually Integrated Technical Architecture Lifecycle)

Revised: 8/10/92
Security: Everyone

VITAL (Virtually Integrated Technical Architecture Lifecycle)

==========

Article Created: 15 July 1992
Article Last Reviewed: 7 August 1992
Article Last Updated:

TOPIC ----------

This article describes VITAL.

DISCUSSION ----------

VITAL (Virtually Integrated Technical Architecture Lifecycle) allows desktop computer users in an enterprise to view data and applications in a way that appears integrated. Users don't have to be concerned about where the data resides or how it's accessed. It also provides information professionals with a framework to develop vendor-independent corporate information systems that use the power of desktop computers in a client/server environment. It further allows information systems executives to maximize the systems they already have in place, and to plan cost-effective migration paths to new systems.

The VITAL framework was initially developed by Apple's internal information systems division, with early collaboration with Digital Equipment Corporation (DEC). VITAL was further refined over a period of three years, with input from some of Apple's largest corporate customers. Apple's internal guidelines encompass more than 1,000 pages of documentation, which aided Apple's information systems and technology division in building a number of information systems.

The VITAL framework groups information activities and resources in an enterprise into five areas:

- Data capture
- Data access
- Repository
- Desktop integration

• Systems infrastructure

Corporate customers commonly have all of these functions, often running on a variety of platforms. The VITAL framework provides a series of decision matrices and design templates which help customers make design decisions. VITAL is an open architecture.

Systems Integrators Announce Support

KPMG Peat Marwick, a major systems integrator, along with KPMG.ExIS, a Macintosh-focused integrator, have announced support for VITAL. They have staff trained and experienced in VITAL to help clients who want to implement VITAL in their own organizations.

Apple Announces Supporting Documentation and Programs

Corporate customers can obtain more information about VITAL through a series of white papers from Apple, the first of which, "Introduction to VITAL: Designing Information Systems for the 1990s," is available to U.S. customers by calling (800) 635-9550, ext. 502 -- or through their Apple National Account executives. Apple plans to deliver five more white papers, which are based on over 1,000 pages of IS&T documentation, over the next 18 months.

Apple also created a Customer Advisory Board, an independent board that will guide Apple in the further evolution of VITAL. Charter members include Liberty Mutual Insurance Group and Stanford University.

Apple will provide briefings to its corporate customers through its corporate briefing program. In addition, Apple will offer a series of Corporate Enterprise Computing Conferences beginning this summer.

A Persuasion presentation, and a Microsoft Word Q&A document are available on AppleLink:

A/UX: Disktab Entry for LPS

==========

Article Created: 17 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I have A/UX 3.0 installed on a Quantum LP240S disk (Alliance Peripheral Systems). I need the correct information for this drive for the /etc/disktab file.

DISCUSSION -----

The Quantum LP240S drive is the same mechanism used for the Apple 230MB drive.

The following entries apply to both the Apple 230MB and the Apple 400MB drives:

```
# Quantum LP240S, Apple 230MB drive
#
  LP240S|HD230SC:\
      :ty=winchester:ns=60:nt=4:nc=1930:

# Seagate ST1480, Apple 400MB drive
#
ST1480|HD400SC:\
      :ty=winchester:ns=54:nt=9:nc=1760:
```

The entries for the file /etc/disktab can be created from the drive specifications, and we don't have access to all the drives in the market.

You should be able to request the following information from the vendor to create entries:

Number of Heads = nt

```
   Number of Sectors/Track = ns
   Number of Cylinders/Disk = nc
```

To locate a vendor's address and phone numbers, use the vendor name as a search string.

DAL/VTAM: Can't DESCRIBE Group ID or PUBLIC Tables (8/94)

Revised: 8/31/94
Security: Everyone

DAL/VTAM: Can't DESCRIBE Group ID or PUBLIC Tables (8/94)

==========

Article Created: 16 July 1992
Article Reviewed/Updated: 31 August 1994

TOPIC ----------

I'm running DAL 1.3.5 VTAM against a DB2 database. On a DESCRIBE databases command (which is generated when users load tables in client tools like GQL and Dataprism), I can only see tables that have been specifically granted to me on my user ID. I can't see tables that are in the Group ID or PUBLIC, even when I open the database with the "as User" clause using the DAL Tester application.

This causes the client tools to deny access to tables I'm really authorized to see. I can issue queries from the DAL Tester, so I know DAL is letting me access them, just not describe them.

Is this inability for the DESCRIBE command to see all tables authorized a limit of DAL 1.3.5? Or is there a problem in host configuration with DAL server, DB2, or ACF2?

DISCUSSION ----------

This isn't a limit in DAL. This is normally caused by the specific view or site-level view not being created at the same time that the DB2 catalogs deny read access to "Public." This normally results in the "-551" error from DB2.

The Database Administrator must create the correct view(s). Sample definitions for view creation are included in Appendix B of the Installation Guide.

If the DBA has created the view(s) and the problem persists, please send us the statement(s) used to create the view.

With a license agreement between Apple Computer and ITI (Independence Technologies, Inc.), ITI will market DAL products and provide all support to DAL customers. To locate ITI's address and phone number, use ITI as a search string.

Macintosh PC Exchange: Mapping Database Files (9/94)

Revised: 9/2/94
Security: Everyone

Macintosh PC Exchange: Mapping Database Files (9/94)

==========

Article Created: 16 July 1992
Article Reviewed/Updated: 02 September 1994

TOPIC ----------

Does Macintosh PC Exchange's extension mapping capability include the ability to map database files?

My guess is that I can set it up to open FileMaker, 4D, and so on, for files with the extension .dbf. But will it work? Are there applications on both or all three platforms (Macintosh, DOS, Windows) that will recognize and properly open files with this extension in the same way that Excel, Lotus, and so on, can open WKS files?

DISCUSSION ----------

The facility of mapping file types to a complementary file type on the Macintosh doesn't make Macintosh PC Exchange a file translation utility. You must be careful to specify the correct type of document that the Macintosh application will support. If you are unsure of which document type, use TEXT or launch the application and then choose the Open command from the File menu.

To our knowledge, FileMaker Pro version 2, Omnis 7, and FoxBase can open the data files of their equivalent Windows or DOS applications.

Macintosh: How To Connect an External SCSI Device

Revised: 7/17/92
Security: Everyone

Macintosh: How To Connect an External SCSI Device

==========

Article Created: 15 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

This article provides Apple's recommended procedure for connecting an external SCSI device to a Macintosh computer.

DISCUSSION -----

To connect an external SCSI device to your Macintosh, follow these instructions:

1) Turn off your Macintosh and ensure that the power cord is plugged into a grounded power outlet.

2) Ensure that the external SCSI device is turned off, then plug it into a grounded power outlet.

3) Touch any metal connector on the back of your computer to discharge any static electricity from your clothes or body.

4) Connect the SCSI System cable to the SCSI port on the back of your Macintosh.

5) Connect the other end of the SCSI System cable to one of the SCSI ports on the external device.

6) Add a terminator to the other SCSI port on the external device, if appropriate (see "Note" at the end of this article).

7) Turn on the external SCSI device.

8) Wait a few seconds for the device to come ready.

9) Turn on your Macintosh computer.

Note

Refer to the product User's Guides or search the Tech Info Library for related information about:

- SCSI termination
- SCSI ID numbers

and for information about SCSI chains when connecting more than one external device.

Security: Everyone

MacTerminal 3.0: Installation with System 7.0.1

==========

Article Created: 23 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

I attempted to install MacTerminal 3.0 on a Macintosh II running System 7.0.1. This was a version I received about a year ago, that didn't mention System 7. All examples and instructions were keyed to System 6.

During the first floppy disk installation procedure, it flagged the Communications Toolbox as already existing on the target disk. But when installing the second floppy, it complained because it didn't find a Communications Toolbox folder where it expected to find or put various tools unique to MacTerminal 3.0.

I created a Communications Toolbox folder in my System Folder, and manually copied the tools from the floppy disk. This didn't work when I tried to run the application -- it simply said it couldn't find any tools.

How do I resolve this problem?

DISCUSSION ----------

Here's how to install MacTerminal 3.0 on System 7.x:

The Installer on Disk 1 of the MacTerminal 3.0 package installs the Macintosh Communications Toolbox. Since the Macintosh Communications Toolbox is built into System 7.x, you don't need to run the Installer.

1) Remove the Communications folder you created manually. In System 7.x, the Communications Tools reside in the Extensions folder in the System Folder. Drag these Tools from Disk 2 directly to the Extensions folder, or to a closed System Folder, and System 7.x will put the Tools in the Extensions folder.

2) Create a new folder called MacTerminal 3.0 on your hard disk, and drag the MacTerminal application and sample session documents from the MacTerminal disk to this new folder.

Macintosh OS: No Multiple Password Assignment with File Sharing

Revised: 8/13/92
Security: Everyone

Macintosh OS: No Multiple Password Assignment with File Sharing

==========

Article Created: 23 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I have the same user ID definitions in multiple Macintosh computers that support File Sharing under System 7.0. Is it possible (or are any utilities available) to change the password in one Macintosh only, and automatically change the passwords in all other Macintosh computers?

This type of functionality exists in the UNIX world.

DISCUSSION -----

This facility isn't available under the Macintosh OS. This particular area of network management came about in the UNIX world as the complexity of managing multiple computers, groups of users, and so on became more common (especially in large computer environments, not in the single-user workstation environment).

And there is a lot of resistance to this in the Macintosh community (some find it intrusive), and raises different issues of security.

AppleTalk Remote Access: When It Doesn't Relinquish Serial Port

Revised: 8/13/92
Security: Everyone

AppleTalk Remote Access: When It Doesn't Relinquish Serial Port

==========

Article Created: 23 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

AppleTalk Remote Access normally relinquishes the serial port it occupies while waiting to answer a call, if another communications program attempts to use the port. However, this doesn't happen when the following conditions are true:

1) The other communications program is using Communications Toolbox.

2) The connection tool selected is the "serial tool."

In the described case, the serial tool reports the port busy and AppleTalk Remote Access doesn't relinquish the port. I verified this using all configurations of:

Software: Microphone II v4.0 and MacTerminal
Hardware: Built-in serial port, built-in printer port, QuadraLink ports.

DISCUSSION -----

In order for an application to properly work with the Serial Port Arbitrator, it's necessary for it to:

1) Test to see whether the serial port arbitrator is present,

and if present,

2) Call OpenDriver to request use of the serial port.

AppleTalk Remote Access would then relinquish its "passive" claim on the

port to the application requesting its use. Once the application is done with the serial port, it calls CloseDriver, which allows AppleTalk Remote Access to reassert its "passive claim." Complete details are available in the AppleTalk Remote Access Developer's Toolkit (Product #R0128LL/A from APDA).

Keep in mind that "passive claim" is true only when AppleTalk Remote Access is set to answer calls.

Until applications are modified to work with the AppleTalk Remote Access Serial Port Arbitrator just described, you'll continue to get the "serial port busy" message. The only workaround is to turn off the answer calls option of AppleTalk Remote Access.

Stabilant 22-A: Enhances Marginal Electrical Connections (2/96)

==========

Article Created: 21 July 1992
Article Reviewed/Updated: 14 February 1996

TOPIC ----------

Does Apple offer any products to service providers to help ensure solid electrical connections for the many different connectors found in Macintosh products and Apple printers?

DISCUSSION ----------

Apple does not offer any service tools for repairing or enhancing electrical connections. However, there are third-party products that can be safely used to repair and/or enhance connections without damaging the connection or the surrounding material.

Technicians agree that the most difficult troubleshooting involves intermittent problems and that many intermittent problems can be traced to poor electrical connections or connectors. Reseating the connection may temporarily correct the problem, but for long-term success, the connector should be repaired or replaced.

Stabilant 22-A is a contact-enhancing product by D.W. Electrochemicals Ltd., Ontario, Canada. It is a non-conductive block polymer that becomes conductive in the presence of an electrical field or when placed in a very narrow gap between electrical contacts. Stabilant 22-A remains non-conductive between adjacent contacts in a multiple-pin environment. Users of this product report that it works especially well on SIMM, serial, SCSI, and internal LaserWriter connections. It can also be used for audio and video connectors.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

Revised: 9/14/92
Security: Everyone

A/UX: Magneto Optical (MO) Drives

==========

Article Created: 23 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

What can you tell me about compatibility of A/UX 3.0 and 3.5-inch optical drives? In particular, DGR Tech. 128REM drive and MacProducts Magic128 Optical. I believe they both use a MOST mechanism, and come with FWB HD Toolkit Lite formatting software.

DISCUSSION ----------

According to A/UX compatibility testing, none of the Magneto Optical Disk drives was tested with A/UX 3.0. In general, if you can format and partition the drive for A/UX, and the A/UX generic disk driver can recognize the disk, then it should work OK. The Sony SMO-E501 and Hammer 600S optical drives work in A/UX since there's a disktab entry (in /etc/disktab) for them.

The Pinnacle Micro REO-130 works fine with all versions of A/UX, even A/UX 1.xx.

Macintosh Quadra: Support for 16-Bit Color

==========

Article Created: 23 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I have a Quadra 700 with VRAM upgraded to enable MILLIONS of colors. However the THOUSANDS selection isn't available in the Monitors control panel. Why?

Quadras with 13-inch RGB monitors have thousands and millions as bit-depth options. Why doesn't the 16-inch monitor?

DISCUSSION -----

The Quadra 700 and 900 don't support 16-bit color (thousands of colors). This was a feature added to the Quadra 950. A different chip containing a CLUT (Color Lookup Table) that could support 16-bit color was included in the redesign of the Quadra 950.

The ability to support this many colors isn't dependent on the size of the screen, but it influences the amount of VRAM you must have installed.

PowerBook & Portable: Cracked AC Adapter Warning 7/92

Revised: 5/16/94
Security: Everyone

PowerBook & Portable: Cracked AC Adapter Warning 7/92

==========

Article Created: 23 July 1992

TOPIC ----------

This article discusses a problem with some AC Power Adapters that may damage the logic board fuse on a Macintosh PowerBook, Macintosh Portable, or Backlit Macintosh Portable.

DISCUSSION ----------

The suspect power adapters have chipped or cracked plastic insulation on the plug that attaches to the logic board. This chipped or cracked insulation could let the ring and tip leads of the connector short together and destroy the fuse. The connector can blow the fuse even if the power adapter is not plugged in to AC power -- the connector itself shorts the fuse.

If you find a power adapter with chipped or cracked insulation between the tip and ring leads on the connector, DO NOT USE IT. A visual check is all that is needed to confirm the problem.

Return any suspect power adapter to your local authorized service provider for replacement.

AppleShare 3.0: Disabling Automatic Log On

Revised: 8/13/92
Security: Everyone

AppleShare 3.0: Disabling Automatic Log On

==========

Article Created: 24 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I'm setting up a lab where the systems will be connecting to an AppleShare file server. I want to disable automatic log on to the servers at startup. It's currently configured this way on my System 6.0.3 Chooser, but I'd like to modify the System 7 Chooser to do the same. Is this possible?

DISCUSSION -----

Modifying the System 7 Chooser to prevent auto-mounting of a remote server isn't a trivial programming task, and we don't recommend or support this. Fortunately, AppleShare 3.0 has a provision to prevent a remote AppleShare server from being mounted automatically on startup.

To prevent registered users from logging on to the server automatically at startup, launch the AppleShare Admin program and select File Server Preferences in the Server menu. Make sure the option, "Allow Users to Save Password for Automatic Login" isn't checked, and save any changes. From that point on, registered users can't check "Save My Name and Password."

Registered users who configured their systems to auto-mount a server before you disabled this option, will still be auto-mounting the server unless:

- The users reselect that server, updating the AppleShare Prep file,

  or

- The users' AppleShare Prep files (in the Preference folder) are thrown away. The AppleShare Prep file contains the auto log on details. A new Prep file will be created next time they choose to mount a server.

Note that only registered users will be prevented from auto-mounting a server. If you enable Guest access to the server, guests may still auto-mount a server, because a password isn't requested or required.

Some third-party INITs that prevent automatic mounting of a server are available, but the INITs we know of don't work properly with System 7.

PowerBook: Configuring for Minimum Noise (8/93)

Revised: 5/17/94
Security: Everyone

PowerBook: Configuring for Minimum Noise (8/93)

==========

Article Created: 20 July 1992
Article Reviewed/Updated: 16 August 1993

TOPIC ----------

How can I set up a PowerBook for efficient, quiet use in meetings?

DISCUSSION ----------

Configuring a PowerBook especially for meetings can prolong battery life tremendously and reduce noise. Using this configuration, one can usually get a full day's work out of a single battery charge on non-color PowerBooks.

At least 6MB of RAM is required for this setup, and more is recommended. The more RAM you have, the larger your RAM disk can be, and the more files you can fit on it.

Here's a configuration to try:

- A 3.3MB RAM disk that holds a minimal System Folder plus a few items like a word processor application (no accessory files), and some documents (usually 50K to 200K).

- Don't run anything from the hard disk, so that it stays asleep essentially all the time. Copy documents to the hard disk, which powers the hard disk briefly, only once in a while. Not running the hard disk saves power, reduces noise, and greatly speeds wakeup and system performance. (If you want to keep the hard disk from spinning at all until the next startup, drag it to the Trash, unmounting it from the desktop. You will then need to restart the PowerBook for the hard disk to appear again.)

- Use the PowerBook File Assistant Sleep Fkey function (or a similar utility) so that you can put the PowerBook to sleep instantly from the keyboard by pressing the key sequence Shift-Command-0.

- Whenever there doesn't appear to be anything worth noting for the next several seconds, use the Sleep Fkey to put the PowerBook to sleep instantly. When you need to take a note, press a key to wake the PowerBook up and start typing instantly. The instant wakeup response is possible only if AppleTalk is turned off and you don't need to access the hard disk (as is the case if you're using a RAM disk). Otherwise, AppleTalk causes a delay of a second or two. Hard disk spinup causes a significantly longer delay. This way, your PowerBook may be asleep for most of the meeting and awake only while you're actually typing.

- Turn Off Sound Using the Sound CDEV
  Note: this won't turn off the startup sound on the PowerBook 100, 140, 145, 145B and 170. The only way you can turn it off completely on those machines is by inserting a dummy plug into the PowerBook sound-out port.

A/UX: MacWrite II, Temp File, and File is Locked Error

Revised: 9/14/92
Security: Everyone

A/UX: MacWrite II, Temp File, and "File is Locked" Error

==========

Article Created: 29 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

MacWrite II works just fine after logging in as root and moving MacWrite II into my A/UX system in the root (/) directory. However, if I try to use the same copy of MacWrite II logged in as another user, I get an error message that "File is locked." I do have a personal system folder for this other user. The only related file I could find in the /mac/sys/SystemFolder, the root SystemFolder, and the user's SystemFolder was "Claris Fonts".

I changed the permissions to 777 on all three of those files and the MacWrite II application, but this didn't help. There's no Claris Folder created for the translation scripts on the system.

Which file is locked?

DISCUSSION -----

The MacWrite II application creates a temporary file called "MacWrite II Temp" in the SAME directory with the MacWrite II application. If you don't have "write" permission in the directory where MacWrite II resides, you'll get the "File is locked" error. It has nothing to do with the "Claris Fonts" file.

A workaround for other users is to drag the MacWrite II application onto the desktop. This way the "MacWrite II Temp" file will be created under the user's "home/.mac/hostname/Desktop Folder" directory.

Note that the use of the "launch" command or making an alias for the application doesn't work either. It would be nice if the temporary file could be created under the current directory or in the /tmp directory while

using the "launch" command.

DAL: How to Insert a NULL Character

Revised: 7/31/92
Security: Everyone

DAL: How to Insert a NULL Character

==========

Article Created: 29 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

The DAL API function "CLSend" accepts as input parameters: a session ID, a character string, and a length. If the length is -1, the character string is assumed to be null-terminated (that is, a C string). If the length is greater than zero, it is accepted as the length of the character string.

I run into a problem if I provide an explicit length because one of the characters in my character string happens to be a null (hex 00). The string is truncated at the null (rather than using the full length specified in the length parameter).

Fortunately, I can read a null from a column of data type character. It seems that I should be able to insert a null character into the database also. Therefore, I should be able to include a null character in a character string that I'm sending with "CLSend".

DISCUSSION ----------

The following is described in detail in the DAL Programmer's Reference:

A special literal, $NULL, is used to indicate that a DAL value is NULL. The $NULL literal can appear in assignment statements, for example:

```
integer x;
x = $NULL;
```

SQL statements and expressions can also contain the $NULL literal:

```
insert into mytable values ( 1, "ABC", $NULL );
```

..TIL10488-DAL-How_to_Insert_a_NULL_Character.pdf

In the strictest sense, $NULL is not a value, but an indication that a value isn't known. In most cases, however, you can use the symbolic constant $NULL as a DAL literal in expressions.

At Ease 1.0: Product Description (8/95)

Revised: 8/9/95
Security: Everyone

At Ease 1.0: Product Description (8/95)

==========

Article Created: 3 August 1992
Article Reviewed/Updated: 9 August 1995

TOPIC ----------

At Ease, an extension to System 7, provides an alternate environment for users who want a simple, uncluttered, interface for application and document launching, plus simple system and hard-disk protection. It's a friendly, safe, one-touch desktop designed especially for the education and home markets.

At Ease doesn't entirely replace the Macintosh Finder: you'll still need the Finder for throwing files away, adding new applications, and so on.

DISCUSSION ----------

Why Is At Ease Needed?

For many novice (especially young) Macintosh users, some elements of the Macintosh interface are difficult to master: for example, aiming the mouse, double-clicking, and using pull–down menus.

And school lab administrators have told us they need a better way to:

• Maintain standard settings on each computer.

• Prevent student from accidentally -- or maliciously -- trashing applications, documents, or System Folders.

• Limit students' access to a predetermined set of applications and documents.

• Teach young or novice users how and where to locate and save applications and documents.

At Ease simplifies the common tasks of finding and launching applications and documents, while providing a simple level of protection for a Macintosh computer's system settings, and for the files and folders on the hard drive.

Features

In addition to a simple and consistent interface, At Ease provides:

• Easy initial setup with a "Gather all Applications" button for quick setup.

• Optional password access to the Finder, System Folder, Control Panels, or any application or document not meant to be available to all user.

• Password protection, with a 'clue' to help young users remember the password. Files can't be thrown away or moved without the password.

• Documents and applications alphabetized for easy access.

• Mouse Practice, a fun and interesting tutorial on how to use a mouse.

Some At Ease options:

• Require that files be saved only to a floppy (so that nothing can be saved to the hard disk).

• Have buttons added automatically to At Ease.

• Remove items such as the Chooser from the Apple Menu Items folder, making them unavailable to users.

• Add specific Control Panels (Sound, for example) or aliases to the Apple Menu Items folder for quick access.

At Ease allows twelve to twenty icons per page, depending on display size. Displays less than 640 pixels wide contain four columns; larger displays contain five columns.

At Ease supports file Sharing, background printing, most Apple menu items, startup folder items, System 7 Tune-Up, and Balloon Help. And At Ease saves RAM -- as much as 200K.

The At Ease Package

At Ease consists of:

• A control panel with which a teacher, parent, or lab monitor turns on At Ease and sets up access to documents, applications, and hard drives.

• An application that handles application and document launching.

• An "At Ease Items" folder containing aliases to the objects displayed in At Ease.

• A Preferences file, which contains an encrypted version of the password.

Technical Details

When a user clicks on the 'on' button to start At Ease, the boot blocks of the boot volume are altered so that At Ease is used in place of the Finder. When the 'off' button is clicked, the boot blocks are restored.

When the At Ease system has been restarted (the At Ease control panel turned on), the extension contained in the control panel executes, installs some trap patches, and creates an 'At Ease Items' folder in the System Folder. Any Control Panels or folders put into the At Ease folder will be ignored.

Support

At Ease is simple to set up and use. Apple provides support toll-free for one year from date of purchase. (Because At Ease requires System 7, many customers will be upgrading to System 7 first, and then installing At Ease. The personnel answering At Ease questions can also answer System 7 questions.)

At Ease: Support Issues (8/95)

==========

Article Created: 03 August 1992
Article Last Reviewed/Updated: 04 August 1995

TOPIC ----------

This article describes some support issues relative to the original At Ease software.

DISCUSSION ----------

- At Ease requires System Software version 7.0 or later. It does not run under System 6.x

- A 'back door' to At Ease allows the system to be started up from a System Disk, giving the user access to the entire system. Users cannot, however access the system by holding down the Shift key after a restart, or by doing a force quit.

- Once mounted, file servers cannot be unmounted without restarting the system, or launching the Finder.

- If the option to create a button in At Ease is selected, then a button will be created for every document -- even those saved to a floppy for transfer.

- Users cannot delete unwanted files from a floppy disk from At Ease -- they must go to the Finder.

- AppleTalk Remote Access Administration (accessing users and groups) cannot be done from At Ease. Again, users must launch the Finder.

- Clicking "Remove the original" in the Set Up control panel will truly remove -- permanently -- the original application or document from the hard drive.

- If there is a document button in At Ease, and the original is removed

in the Finder, the next time a user attempts to launch that document, a message will explain that the original cannot be found. At this point, At Ease will remove that document's icon from the document page. If At Ease cannot find the original document or application because the volume on which it resides is not connected, At Ease will explain this and will NOT remove the icon.

- When you go to Finder from At Ease, At Ease is still running and is making aliases to the documents you save. You can either go to the At Ease Setup Control Panel and press the "Setup Documents..." button and uncheck "Add a button to At Ease" -- or you can turn off At Ease and restart.

- When At Ease is running, fonts and sounds cannot be moved in and out of the System file. You must turn off At Ease and restart.

- If a user is connected to an At Ease system, and the host restarts, no warning will be sent to the user connected to the host. Disconnect is immediate.

- To remove At Ease, use the Installer: Choose Customize, hold down the Option key, and choose 'Remove'. Dragging the At Ease components to the Trash may prevent you from restarting the Macintosh.

Macintosh Finder: Cure for Disappearing Folders (5/96)

Revised: 5/25/96
Security: Everyone

Macintosh Finder: Cure for Disappearing Folders (5/96)

==========

Article Created: 31 July 1992
Article Reviewed/Updated: 25 May 1996

TOPIC ----------

A Macintosh running under System 6.0.x (I know this has happened under 6.0.3, 6.0.5, and 6.0.7) suddenly "loses" folders alphabetically. That is, folders up to a certain point (anywhere from C to S) DO appear on the desktop, and the rest appear to be missing. However, the computer still starts up from the System Folder ("missing"), and all the appropriate (if applicable) INITs load.

Find File cannot locate any of the missing folders or files within those folders. Norton Utilities (at least 1.0), as well as SUM, can't retrieve any missing files or folders. The size count across the top of an Icon view window shows the same material that was present before, but the number of items reduces to the visible ones.

Nothing that I've tried has ever brought those files back, although they're supposedly still present. Applications can't see the files either.

I reformatted the hard drive and restored the backups.

DISCUSSION ----------

Fortunately, the disk corruption you have encountered -- files and folders disappear -- rarely occurs when using System Software 6.0.x (and happens only slightly more often under System 7). Unfortunately, there are no simple workarounds to repair System 6 volumes.

Although the corruption and symptoms with System Software 6.0.x and System 7 are similar, the events leading to the corruption are different, as are the workarounds.

Workarounds

You have two options in dealing with this situation:

1) If you wish to continue to use System 6.0.x, perform frequent backups, and use them to restore the information on your hard drive. The System 7 Find command uses calls that don't exist under System 6.0.x. Therefore, to retrieve files from a 6.0.x volume, connect that drive to a Macintosh running System 7, and use the Find from System 7.

2) Upgrade to System 7 and Tune-Up 1.1.1.

NOTE: The Installation of the Tune-Up 1.1.1 extension patches and corrects some code in System 7. The first time that System 7.0.x is started up with the Tune-Up extension installed, the Tune-Up correction code is moved into the System file itself. This happens to avoid exposure of starting System 7.0.x with extensions off. The Tune-Up fix is always present once the Mac OS is started once with the Tune-Up installed.

Repairs Under System 7

Disk First Aid (DFA) v7.1 was revised to fix this corruption on System 7 volumes. It will ship with System 7.1. Our testing indicates DFA is much more successful in repairing the volume when used soon after the corruption occurred, the files or folders will reappear after repairing the corrupted file system structures. Therefore, if your files or folders disappear on your System 7 volume, don't use that drive if possible, until you can fix it with DFA.

Repairs Under System 6.0.x

Since Disk First Aid v7.1 will only repair System 7 volumes, you'll have to:

• Rely on third-party repair tools, and make sure the one you select addresses this problem specifically, or

• Recover what you can (see the Workarounds section), and reformat the drive.

Note that we haven't evaluated the effectiveness of using third-party repair tools. You may wish to check with the distributor prior to purchase or use.

PowerBook 145: Questions and Answers 8/92

Revised: 5/16/94
Security: Everyone

PowerBook 145: Questions and Answers 8/92

==========

Article Created: 3 August 1992

TOPIC -----

This article answers some anticipated questions about the new PowerBook 145.

DISCUSSION -----

Q. How is it different from the PowerBook 140?
A. The 68030 processor in the PowerBook 145 has clock speed of 25 MHz, compared to the PowerBook 140's 16 MHz 68030. This gives the PowerBook 145 a 35% performance improvement over the PowerBook 140, which it replaces.

Q. What version of system software is used?
A. The PowerBook 145 uses System 7.0.1 with System 7 Tuner 1.1.1.

Q. If a user wants to add a 4MB memory card to a 4MB PowerBook 140, how much memory will be available?
A. A 4MB system has 2MB on the logic board and a 2MB memory card. The system will have 6MB, because the 2MB card would be removed (2MB on board + 4MB memory card = 6MB system).

Q. Can a user install an internal modem and still use both serial ports?
A. The printer serial port is always available; the user could switch between the modem serial port and the internal modem, but could not use both internal modem and modem serial port at the same time.

Q. Does the PowerBook 145 have a SCSI Disk Mode like the PowerBook 100 does?
A. No, the PowerBook 145 is based on the PowerBook 140, which does not support SCSI Disk Mode.

Q. How does the PowerBook 145 work with MIDI applications?
A. There is no problem with applications that support the MIDI Manager, except applications that require a large amount of data to be sent to

the computer, such as dumping samples back into the computer. Check with the developer to make sure the application uses the MIDI Manager. Applications that do not use the MIDI Manager will have problems running on the PowerBook 145.

Q. When transporting a PowerBook, which should I use: Sleep or Shut Down?
A. Use the Shut Down menu item. This saves power and causes you to save important documents.

SNA•ps: Compatibility with Other Apple Products (6/94)

Revised: 7/11/94
Security: Everyone

SNA•ps: Compatibility with Other Apple Products (6/94)

==========

Article Created: 4 August 1992
Article Reviewed/Updated: 29 June 1994

TOPIC ----------

What is the compatibility of SNA•ps with other Apple products?

DISCUSSION ----------

SNA•ps stands for Systems Network Architecture protocols and service, and is a family of applications that provide Macintosh users with integrated access to IBM mainframe (System/370 and System/390) and mid-range (AS/400 only) systems. SNA•ps 3270 or SNA•ps 5250 is end-user application software that presents the user with one or more 3270 or 5250 terminal sessions. It's designed to present the user with a text-based interface to applications, data, and services. The SNA•ps Gateway is server software that provides a network access to IBM mainframe and mid-range systems. It's designed to serve as an IBM gateway for multiple Macintosh computers attached to AppleTalk networks.

The SNA•ps 3270 application, which is included in both the SNA•ps 3270 and SNA•ps 3270 GC (gateway client) packages, will run on the Macintosh Plus and later systems. The SNA•ps Gateway application runs on one of the three Apple NuBus cards, and so requires any Macintosh II or Quadra system that incorporate NuBus. One caveat: the SNA•ps 3270 application includes support for certain connections (CUT and NLCA) on the Apple Coax/Twinax Card, which also requires a Macintosh II or Quadra computer.

The SNA•ps 5250 application software works with the Apple Token Ring 4/16 NB Card or Apple Serial NB Card installed in any Macintosh II or Quadra (NuBus capable) computer and supports directly connected or AppleTalk distributed 5250 sessions. SNA•ps 5250 sessions are distributed over AppleTalk allows SNA access for any Macintosh system connected to an AppleTalk network. SNA•ps 5250 also supports TCP/IP connections to an AS/400 for display support only. SNA•ps 5250 was recently enhanced to support AppleTalk Direct to the AS/400 using the IBM supplied AppleTalk ADSP stack.

SNA•ps requires Macintosh system software 7.0 or later.

A/UX doesn't support the SNA•ps 3270, SNA•ps 5250 and SNA•ps Gateway software at this time.

Ethernet supports SNA•ps, but only for connections between Macintosh clients and SNA•ps Gateways over AppleTalk networks. Ethernet is also supported to the AS/400 using the AppleTalk Direct solution. The connection between the SNA•ps Gateway and the mainframe currently must be either coax, SDLC, or Token Ring.

SNA•ps will run on the Apple TokenTalk NB Card (Apple's earlier 4M/bps Token Ring product) for SNA•ps 3270 GC via AppleTalk, SNA•ps 3270 single user full function SNA product (up to 5 sessions), and the SNA•ps 5250 single user full function SNA product (up to 5 sessions). Since you can't expand the MCP RAM on the TokenTalk NB Card beyond 512K, it is NOT recommended to run the SNA•ps Gateway products. Also, because of RAM limitations neither SNA•ps 3270 single user or SNA•ps 5250 single user products can run at the same time as TokenTalk.

SNA•ps will run on the Apple Token Ring 4/16 NB Card and an Apple Serial NB Card, and as a rule of thumb, a Serial or Token Ring card running SNA•ps gateways need 1MB. If multiple host connections are used (for example more than one host AS/400 and 3270 mainframe) at the same time than 2.5MB is suggested.

SNA•ps supports IBM's NetView network management. The NetView alerts supported are listed in Appendix E of the SNA•ps 3270 User's Guide (packaged with SNA•ps 3270 and SNA•ps 3270 GC). You can print directly from the IBM mainframe to a local Apple (or compatible) printer. The SNA•ps 3270 single user, SNA•ps 3270 GC, SNA•ps 5250 single user, and SNA•ps 5250 GC packages include an application called SNA•ps Print which allows you, for example, to send host output directly to a LaserWriter attached to your AppleTalk network.

The following is a partial list of third-party client software that can use the SNA•ps Gateway to access IBM hosts:

- Legent Corp. MacXCOM6.2
- Connectivité "Both."
- Tangram Systems AM:PM
- ASC asc3270
- Andrew Corp. TokenAxcess
- CEL Software Blacksmith
- Data Access Language (DAL) clients such as Brio DataPrism and DataPivot
- Microsoft Excel
- ACI US, Inc. 4th Dimension
- Fairfield Software ClearAccess
- Andyne GeoQuery

You can develop custom applications that use the SNA•ps Gateway services in C, Pascal, or Assembler. The SNA•ps Gateway supports both 3270, 5250 and APPC client application developments through Applications Programming Interfaces (API). These APIs are available from Wall Data directly. You can purchase the SNA•ps APPC Developer's Kit v1.0 and Apple 3270/5250 Developer's Kit v2.0.

To locate a vendor's address and phone numbers, use the vendor name as a search

string.

SNA•ps: Gateway Required for Multiple Sessions

Revised: 8/13/92
Security: Everyone

SNA•ps: Gateway Required for Multiple Sessions

==========

Article Created: 6 August 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

We're upgrading from MacDFT to SNA•ps. The current DFT configuration enables multiple CUT sessions at the workstation. When we run the SNA•ps product without the gateway, we see only one session. With the gateway running on the same Macintosh, we see multiple (5) sessions. Can we have multiple CUT sessions without the gateway running? The network card is the Apple Twinax/Coax card.

DISCUSSION ----------

To clarify: CUT is one session only. When you were running MacDFT and getting five sessions, you were using DFT services, not CUT.

In the SNA•ps world, if you don't run the gateway, you'll be running in CUT mode, which means you'll be running a single session. If you want multiple sessions, you have to run the gateway.

SNA•ps 3270: Configuring for DFT (Multi Session) on Coax

Revised: 8/13/92
Security: Everyone

SNA•ps 3270: Configuring for DFT (Multi Session) on Coax

==========

Article Created: 6 August 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

How do I configure SNA•ps 3270 for DFT?

DISCUSSION ----------

First, verify the environment setup by:

- Making sure that the Apple Coax/Twinax card is installed into one of the slots of the Macintosh II class computer.

- Making sure that the Apple Coax/Twinax card is connected to a coax port from a terminal controller (that is, IBM 3174, IBM 3276, and so on).

- Ensuring the "upstream" SNA configurations are correct, meaning that:

  - The mainframe knows there are LUs defined as display sessions to the line going to the controller,

    and

  - The controller has assigned at least one display LU to the specific coax port that you are connected to.

It's possible to have a maximum of five LUs assigned to a COAX port on a terminal controller. These LUs can be a mix of Display LUs (327X Mod 2,3,4,5) or Printer LUs (3287).

Note: If you wish to get multi-session 327X terminal emulation capability on a non-NuBus based Macintosh (SE, Classic, LC, PowerBooks, and so on), you must use the SNA•ps 3270 GC or use the SNA•ps 3270 package to gain

sessions from a SNA•ps 3270 Gateway.

Next, install the gateway portion of SNA•ps 3270 package. Then run the SNA•ps Manager program to create a new configuration for a coax line. You will notice that it asks you for a combination of number of display or printer sessions (a maximum of five "sessions" between the two). Select the correct combination of printer and display LUs as given to you by the SNA network Administrator.

You'll notice that all "LU Numbers" are set to ZERO (0). There's no way to change these LU assignments in the COAX part of this gateway, so don't try to change them. The LU assignment is taken care of at the controller. Save this configuration file on the Macintosh computer's hard disk.

Start the gateway following these steps:

1) Select the coax line that should be appearing in your "Network Gateway Status" window.

2) Choose "SELECT CONFIGURATION FOR…"

3) Select the COAX definition that you created before.

4) Select the "START GATEWAY" from the GATEWAY menu.

If you didn't see a COAX line in your "Network Gateway Status" window, then the line going to the Apple Coax/Twinax card isn't correctly configured. Contact local System Administration personnel for further assistance here.

Once the Gateway is started:

1) Launch SNA•ps 3270.

2) Under the SESSIONS menu, select CONNECTIONS…

3) Select the gateway that you just started, and select a session from that gateway (either from a pool or from a specific session/LU).

4) Select "CONNECT" from the SESSIONS menu.

If all is correct, you should have a host splash screen on your SNA•ps 3270 Terminal Emulation window.

Macintosh: Unexpectedly Quit Error Codes

Revised: 8/13/92
Security: Everyone

Macintosh: "Unexpectedly Quit" Error Codes

==========

Article Created: 6 August 1992
Article Last Reviewed:
Article Last Updated:

TOPIC ----------

Can you give me an explanation of all the possible error codes after "Unexpectedly Quit"?

DISCUSSION ----------

These codes and descriptions are useful mainly to the programmers who developed the applications that are crashing.

For example, error number 4 indicates that a program generated an instruction that caused the processor to try to divide by zero. As you can see, this isn't particularly useful to anyone but the programmer, who would need to debug the code to discover where this was happening.

Many of the other errors are even more esoteric. A number of books, including Inside Macintosh, contain detailed information on these errors. Here's a small portion of the list of error codes the Macintosh can generate in certain circumstances:

```
dsBusError = 1;                 {bus error }
dsAddressErr = 2;               {address error}
dsIllInstErr = 3;               {illegal instruction error}
dsZeroDivErr = 4;               {zero divide error}
dsChkErr = 5;                   {check trap error}
dsOvflowErr = 6;                {overflow trap error}
dsPrivErr = 7;                  {privilege violation error}
dsTraceErr = 8;                 {trace mode error}
dsLineAErr = 9;                 {line 1010 trap error}
dsLineFErr = 10;                {line 1111 trap error}
dsMiscErr = 11;                 {miscellaneous hardware
```

```
                                                    exception error}
dsCoreErr = 12;                                     {unimplemented core routine
                                                    error}
dsIrqErr = 13;                                      {uninstalled interrupt error}
dsIOCoreErr = 14;                                   {IO Core Error}
dsLoadErr = 15;                                     {Segment Loader Error}
dsFPErr = 16;                                       {Floating point error}
dsNoPackErr = 17;                                   {package 0 not present}
dsNoPk1 = 18;                                       {package 1 not present}
dsNoPk2 = 19;                                       {package 2 not present}
dsNoPk3 = 20;                                       {package 3 not present}
dsNoPk4 = 21;                                       {package 4 not present}
dsNoPk5 = 22;                                       {package 5 not present}
dsNoPk6 = 23;                                       {package 6 not present}
dsNoPk7 = 24;                                       {package 7 not present}
dsMemFullErr = 25;                                  {out of memory!}
dsBadLaunch = 26;                                   {can't launch file}
dsFSErr = 27;                                       {file system map has been
                                                    trashed}
dsStknHeap = 28;                                    {stack has moved into
                                                    application heap}
negZcbFreeErr = 33;                                 {ZcbFree has gone negative}
```

System 7: Key Combination Shortcuts and Tips (8/95)

==========

Article Created: 6 August 1992
Article Reviewed/Updated: 11 August 1995

TOPIC ----------

This article includes (in alphabetical order) the keyboard/mouse combinations you can use with System 7.5. Many of these tips are documented in Finder Shortcuts, under Balloon Help.

DISCUSSION ----------

Alphabetize Icons in a Window

Step 1

Activate the window you want to alphabetize.

Step 2

Choose "By Name" from the "View" menu.

Step 3

Choose "Select All" from the "Edit" menu.

Step 4

Drag all files to the icon that represents the active window.

Step 5

Choose "By Icon" from the "View" menu.

Bypass Set Start-up Device

==========

To bypass the currently selected start-up device (except on a Quadra 700), start or restart the computer while holding down the Command-Option-Shift-Delete keys.

Cancel a Print or Copy Job

To cancel a print or copy job Command-. (period) keys.

Change "About This Macintosh"

To change the menu entry from "About this Macintosh" to "About the Finder" hold down Option while choosing the About document under the Apple menu in the Finder.

Clean Up Icons

Move all icons to nearest point on the grid

Use one of these methods:

• Select Clean Up Window from the Special menu.

• Hold down the Option key and choose Clean Up By Name from the Special menu (this function alphabetizes and aligns icons to the grid and each other, the same as the previously explained Alphabetize Icons in a Window tip).

NOTE: Available in icon views only.

Align icon to grid

Hold down the Command key and drag then release the icon.

Close All Windows at Startup

To close all open windows on the desktop at startup, hold down the Option key. The folders remain closed on subsequent startups, unless you open them in the Finder.

Copy Selected Item to Clipboard

Use one of these methods:

• Select Copy from the Edit menu.
• Press the Command-C keys.

Cut Selected Item to Clipboard
==========

Use one of these methods:

• Select Cut from the Edit menu.
• Press the Command-X keys.

Diacritical Marks (Typing)
==========

Begin_Table

Character	Key Sequence	Example
Grave Accent	Option-`-(any character)	lèvre
Acute Accent	Option-e-(any character)	école
Umlaut	Option-u-(any character)	Böblingen
Circumflex	Option-i-(any character)	maître
Tilde	Option-n-(any character)	mañana
Cedilla	Option-c	façade

End_Table

NOTE: With the exception of the Cedilla (which is a specific character), diacritical marks can be applied to almost any character. The correct sequence is to press the Option key and the key that activates the accent mark. The accent mark is applied to the next key pressed after this sequence.

Dialog Boxes (Using Functions)
==========

Scroll Through List in Open Dialog Box

Use one of these methods:

• Click on the Up or Down arrows in the scroll bar.
• Use the Up or Down arrow keys on the keyboard.

Find a File Quickly in an Open Dialog Box

Type in the name of the file.

NOTE: The Delay until Repeat control in the Control Panel determines how many characters may be entered for a File search.

Select the First File in an Open Dialog Box

Use the Left or Right arrow keys on the keyboard.

Select the Last File in an Open Dialog Box

Press the tilde (~) key.

Switch Drives in an Open or Save Dialog Box

Use one of these methods:

- Click on Drive in the dialog box window
- Press the Tab key.

Switch Keyboard Layout

Press Command-Option keys. This causes the keyboard control panel under System 7 to switch between different keyboard layouts. System 7.5 installs many international keyboard layouts automatically when an easy install is performed.

Move Up File Hierarchy in an Open or Save Dialog Box

Click on the current disk icon or click on the directory name icon at the top of the dialog box to display the file hierarchy and select the one you want.

- Press the Command-Up arrow keys to move closer to the top-level directory.
- Press the Command-Down arrow keys to open a selected folder.

Disable Virtual Memory

Hold down the Command key at startup. Do not release the key until startup is complete.

NOTE: This disables virtual memory, but loads any system extensions. When you restart your Macintosh, virtual memory is turned on again.

Duplicate Item

Click on the item you want to duplicate and use one of these methods:

- Choose Duplicate from the File menu.
- Hold down the Option key and drag the icon to another folder.
- Press the Command-D keys.

Easy Access (Activating/Deactivating)

Easy Access is a function designed especially for the disabled. This function lets you lock modifier keys (Command, Control, Option, Shift, Clear) without having to hold them down. Easy Access must be installed in the System Folder - Control Panels folder.

Activate Easy Access

Without moving the mouse, press the Shift key five (5) times.

Deactivate Easy Access

Step 1: Without moving the mouse, press the Shift key five (5) times.
Step 2: Press any two modifier keys simultaneously.

• Press the modifier key(s) you want to use (do not press modifier keys simultaneously unless you want to deactivate Easy Access).

• Press a nonmodifier key to activate a function.

• Press the modifier key once to activate it for one function (the U icon should now appear with an arrow above it).

• Press the modifier key twice to lock it down for more than one function (the U icon should now be filled with an arrow above it).

If the modifier key is locked, pressing it again unlocks it.

Eject Floppy Disk

Use one of these methods:

• Press the Command-Y keys or choose Put Away in the File menu.

• Drag the floppy disk icon to the Trash.

• Choose Restart or Shut Down from the Special menu.

• Start or restart the computer, and hold down the mouse button.

• Press the Command-Shift-1 keys to eject internal floppy drive 1.

• Press the Command-Shift-2 keys to eject internal floppy drive 2 or an external floppy drive.

• Press the Command-Shift-0 keys to eject any other floppy disk drives.

Press the Command-E keys or choose Eject Disk from the Special menu - if no disks are selected, these function ejects all floppy disks. These functions leave a "greyed out" floppy disk icon on the desktop.

Last Resort

If the disk will not eject you can insert a straightened paper clip into the hole located on the right front of the floppy drive. However, this may damage the floppy drive.

Erase Disk

The Erase Disk command under the Special menu erases any selected disk except a write protected (locked) disk or the disk that contains the active operating system.

Erase Floppy Disk

To erase the selected floppy disk use one of these methods:

- Select Erase Disk from the Special Menu.
- Hold down the Command-Option-Tab keys while inserting the disk.

Extension Manager (System 7.5)

To bring up the Extension Manager at startup hold down the Space Bar.

Force Quit an Application

Press the Command-Option-Esc from within the application.

Use this feature with extreme caution. You should definitely not rely on this as a usual way to quit an application. It is useful in the event that you have unsaved work in other applications when your current application hangs. By using this feature, you can return to the Finder and save the work in your other applications. You should restart your computer after using this feature.

Get Info (Using Functions)

Information

Select the icon and then use one of these methods:

- Choose Get Info from the File menu.
- Hold down the Command-I keys.

Lock Item

Check or uncheck the Locked box in the lower left corner Get Info dialog box.

Change Application Memory Size

Click in the box located next to Preferred Size in the Get Info dialog box and enter the desired size.

NOTE: This function sets the amount of RAM that is allocated to an application when it is launched. It should not be set below the Suggested Memory Size number.

Hide Current Application When Switching to Next

Hold down the Option key while switching applications.

Keypad Mouse (Activate/Deactivate)

To set the keypad to control mouse movement, press the Command-Shift-Clear keys.

- The 1, 2, 3, 4, 6, 7, 8, 9, keys control movement and direction of the pointer.
- The 5 key is the mouse button.
- The 0 key locks the mouse button.
- The decimal point key unlocks the mouse button.

NOTE: This function does not work on a PowerBook without the Mouse Keys extension because there is no keypad.

New Folder Creation

Use one of these methods:

- Choose New Folder from the File menu.
- Press the Command-N keys.

Open a File or Folder

Click on the item you want to open and use one of these methods:

- Select Open from the File menu.
- Double-Click on the item you want to open.
- Press the Command-O keys.
- Press the Command-Down Arrow keys.

Paste From the Clipboard

After a Copy or a Cut, use one of these methods to Paste:

• Choose Paste from the Edit menu.
• Press the Command-V keys.

Postscript File Dump

This function lets you dump postscript files to disk rather than to the printer. The Postscript Files are labeled as Postscript X (where X is a number from 0 to 9). Background Printing must be turned off.

NOTE: This is for LaserWriter driver’s previous to 6.3. Version 6.3 and higher support printing to a PostScript file

Postscript File Dump With Laserprep

Use one of these methods:

• Select Print from the File menu.
• Press Command-P. When the print dialog box appears, click OK. Immediately after clicking OK, press the Command-F keys.

Postscript File Dump Without Laserprep

Use one of these methods:

• Select Print from the File menu.
• Press Command-P. When the print dialog box appears, click OK. Immediately after clicking OK, press the Command-K keys.

Print

Use one of these methods:

• Select Print from the File menu.
• Press the Command-P keys.

NOTE: The command key function is not available at the Finder level.

Put Away Items

Choose Put Away in the File menu to place a selected item(s) back into its folder.

Quit

====

Use one of these methods:

• Select Quit from the File menu.

• Press the Command-Q keys.

NOTE: This command is not available from the Finder level. It is used to quit from an application.

Rebuild the Desktop

Hard Drive

Start or restart the computer while holding down the Command-Option keys.

Floppy Disk

Insert the floppy disk while holding down the Command-Option keys.

NOTE: If the floppy disk is the start-up disk, start or restart the computer while holding down the Command-Option keys.

Screen Dump

The files are saved to disk as Picture X (where X is a number from 0 to 9).

Pict File Screen Dump

Press the Command-Shift-3 keys.

Screen Dump to Imagewriter

Press the Command-Shift-4 keys.

Dump of Active Window to Imagewriter

Press the Command-Shift-Caps Lock-4 keys.

NOTE: The Imagewriter dumps do not work on networked printers.

Select All Items in the Active Window

Press the Command-A keys.

Startup From CD-ROM

Hold down the letter c key (lower-case only).

On a Power Macintosh or Macintosh 630 family (Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, LC 630, and Quadra 630) computer, this directs the computer to startup from the CD-ROM drive instead of the hard drive or floppy.

Switch Startup Disk

Step 1

Open the Startup Control Panel.

Step 2

Select the device you want to use as your startup device.

Trash (Move Something To)

Drag the selected icon to the Trash Can

Delete Files Without Warning/Delete Locked Files

Hold down the Option key and drag a file to the Trash.

Turn Off Extensions (7.x)

Hold down the Shift key at startup until you see Welcome to Macintosh. Extensions off.

This disables, for this startup only, any items that load at startup, such as system extensions, control panels, or chooser extensions. It also disables virtual memory, and background printing with PrintMonitor, and turns the Disk Cache down to 16K (the minimum). It also prevents launching any items in the Startup Items folder.

Undo (the Last Editing Operation)

Use one of these methods:

- Choose Undo from the Edit menu.
- Press the Command-Z keys.

Windows (Manipulating)

Change Size of a Window

Use one of these methods:

- Drag the size box.
- Click the zoom box to expand or reduce the size of a window.

Close Active Window

Use one of these methods:

- Choose Close from the File menu.
- Click the active window’s close box.
- Press the Command-W keys.

Close All Windows

Use one of these methods:

- Hold down the Option key and choose Close from the File menu
- Hold down the Option key and click the active window's close box.
- Press the Command-Option-W keys.

Move Inactive Window

Hold down the Command key and drag on the inactive window’s title bar.

Return to the Finder With No Windows Open

Hold down the Option key while starting or quitting from an application.

Zap the PRAM (7.x)

This operation resets parameters stored in Parameter RAM (PRAM).

Hold down the Command-Option-P-R keys during the restart sequence. Your computer beeps for a normal startup and then beeps again. When you hear the second beep, you may release the keys.

Many default settings for the Macintosh, such as serial port speeds, default application font, mouse scrolling rate, and so on, are stored in PRAM. It is sometimes useful to zap the PRAM to clear these settings and reset them to default values. Reselect any customized values for these settings.

After this operation, you may want to check your General control panel settings. If you have more than 8 MB RAM, also check your Memory control panel settings.

Article Change History:
11 Aug 1995 - Reformatted to make more readible on the World Wide Web.
21 Feb 1995 - Added keyword; made several technical updates; reformatted.
23 Jan 1995 - Added Switch Keyboard Layout shortcut.

DALnet Avatar 1.3.5 Network Adapter: Where To Find It

Revised: 8/7/92
Security: Everyone

DALnet Avatar 1.3.5 Network Adapter: Where To Find It

==========

Article Created: 6 August 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Where is the DAL 1.3.5 AVATAR client driver for clients using the Avatar Gateway (4.01) and MacMainFrame Client software?

DISCUSSION -----

You can find the DALnet Avatar 1.3.5 network adapter on the DAL 1.3.5 Install Disk. The path is:

```
DAL Install
  DAL Files
    DAL Network Adapters
```

Note that you need to do a "customized" installation to select support for 3270-type connections such as Avatar MacMainframe.

PowerBook 145: Specifications (Discontinued)

Revised: 3/22/95
Security: Everyone

PowerBook 145: Specifications (Discontinued)

==========

Article Created: 3 August 1992
Article Reviewed/Updated: 22 March 1995

TOPIC ----------

This article gives technical specifications for the Macintosh PowerBook 145 notebook computer.

DISCUSSION ----------

Microprocessor

• 68030, running at 25 MHz

Address and Data Bus

32-bit Address Bus
32-bit Data Bus

Memory

• Comes with 2MB or 4MB pseudostatic RAM on the logic board and one memory expansion slot.

• Expandable to 8MB of RAM by installing a RAM expansion card in the expansion slot.

Disk Storage

• One built-in 1.4MB drive that uses high-density floppy disks; it reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks.

• One internal 40MB or 80MB hard disk

Display

• 10 inch (254 mm) diagonal

• Backlit Supertwist liquid crystal display

• 640 by 400 pixels

Battery

• NiCad, 2.5 ampere-hours, provides 2 to 3 hours of use before recharging is necessary

• Recharge time: 100% recharged after 5 hours; 80% recharged after 3 hours

Keyboard

• Built-in keyboard with standard Macintosh layout

• Two-level tilt adjustment

Trackball

• Dual-button trackball, 30 mm diameter,

Clock/Calendar

• CMOS custom chip with long-life lithium battery

Interfaces

• One Apple Desktop Bus (ADB) port for keyboard, mouse, and other devices using a low-speed, synchronous serial bus

• Two RS-422 serial ports for LocalTalk networking, printers, modems, and other devices

• One HDI-30 SCSI port for hard disks, scanners, CD-ROM drives, and other devices

• One sound output port for external audio amplifier

• One sound-in port

Modem

• Optional internal 2400-baud modem with facsimile send at 9600 baud; includes facsimile send software

• Error correction and compression: MNP 4, 5 and V.42, V.42bis

Sound Generator

• Apple Sound Chip provides 8-bit sound, capable of driving stereo

headphones or other stereo equipment through the sound port.

Sound Input

• 8-bit sound, sampled at 11 or 22 kHz

Disability Access

• CloseView, Easy Access, and visible beep included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disability.

ADB Power Requirements

• Maximum current draw for all ADB devices is 200 milliamps (a maximum of three ADB devices is recommended)

Electrical Requirements

• Line voltage: 100 to 240 volts

• Frequency: 50 to 60 Hz

Environmental Requirements

• Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)

• Storage Temperature: -40 to 65° C (-40 to 148° F)

• Relative humidity: 20% to 80% noncondensing

• Altitude: Operating: 3048 m (10,000 ft.) maximum
Shipping (non-operating) 0 to 15,000 ft. (0 to 4,722 m)

Size and Weight

• Height 2.25 inches (5.7 cm)
• Width 11.25 inches (28.6 cm)
• Depth 9.3 inches (23.6 cm)
• Weight 6.8 lb (3.03 kg)

Noise Level

Noise free except for floppy or hard disk use.

Article Change History
---
22 Mar 1995 - Updated altitude information.
02 Jun 1993 - Updated to correct voltage specification.
19 Feb 1993 - Updated to correct storage temperature range.

A/UX: Formatting 1.4MB Disks

Revised: 9/14/92
Security: Everyone

A/UX: Formatting 1.4MB Disks

==========

Article Created: 7 August 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

I'm running A/UX 3.0, and I can't format 1.4MB floppy disks.
I used these commands:

```
diskformat -dens 1440 /dev/rfloppy0
diskformat -dens 1440 /dev/rfd0
```

I also couldn't format 1.4MB floppy disks under A/UX 2.0.1. I have no problem formatting 800K floppy disks.

DISCUSSION -----

You shouldn't have difficulty formatting 1.4MB disks under A/UX 2.0.1 or 3.0. Here are some common scenarios that may help you discover the source of your problem:

- If you insert an unformatted floppy disk under A/UX CommandShell or A/UX Multi-Finder environment, it displays that the disk is unreadable and asks you to "Eject" or "Initialize". If you select "Initialize", it initializes in Macintosh HFS format.

- If you insert a formatted Macintosh HFS floppy under A/UX CommandShell, it displays that this is a Macintosh disk and asks if you want to use it as "UNIX Data" or "Macintosh" or "Eject". If you select "UNIX Data", the floppy disk icon disappears from the desktop. Then you can use any A/UX command, like "diskformat", "tar", "cpio", "dd", "newfs", and so on, to manipulate the floppy disk.

- If you insert a formatted Macintosh HFS floppy disk under A/UX MultiFinder, the floppy disk icon should appear on the desktop. If you

switch to A/UX CommandShell and try to format it with "diskformat", you get the "cannot open /dev/rfloppy0" message. This is due to the A/UX Finder currently occupying the floppy disk drive.

- If you insert a UNIX file type of floppy disk under A/UX CommandShell, no floppy disk icon appears on the desktop. You can manipulate the floppy disk in UNIX.

- If you insert a UNIX file type of floppy disk under A/UX MultiFinder environment, it will display that this isn't a Macintosh disk, and ask if you want to "Eject" or "Initialize".

A/UX 3.0: Doesn't Support Proxy ARP

Revised: 9/14/92
Security: Everyone

A/UX 3.0: Doesn't Support Proxy ARP

==========

Article Created: 10 August 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Does A/UX support Proxy ARP?

DISCUSSION -----

No, the current version of A/UX 3.0 doesn't support Proxy ARP (Address Resolution Protocol), which is an Internet protocol used to dynamically map between Internet IP and Ethernet addresses.

The routing mechanism supported under A/UX is for fixed routes set up in the routing table at startup time. Here's an example of configuration commands:

```
ifconfig ae0 130.43.4.10 netmask 255.255.255.0
```

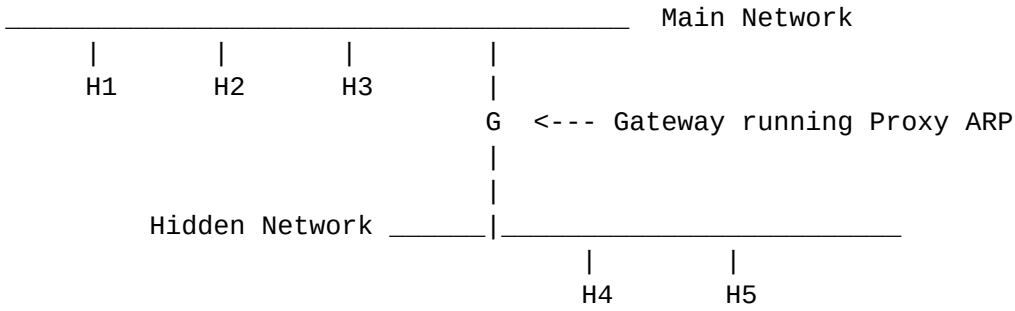
and/or

```
route add 130.43.6.0 130.43.4.1 1
```

This specifies that in order to reach network 130.43.6, a gateway at address 130.43.4.1 should be used.

A section of text in "Internetworking with TCP/IP" by Douglas Comer describes Proxy ARP in great detail. Here's a part of the text:

> The term proxy, promiscuous ARP, and the ARP hack refer to a second technique used to map a single IP network prefix onto multiple physical addresses. The technique, which only applies to networks that use ARP to bind internet addresses to physical addresses, can best be explained with an example below:



Proxy ARP technique (the ARP hack) allows one network address to be shared between two physical nets. Gateway G answers ARP requests on each network for hosts on the other network, giving its hardware address and then routing datagrams correctly when they arrive. In essence, G lies about IP-to-physical address bindings.

RS-232 Cable Length and Macintosh Performance

Revised: 9/22/92
Security: Everyone

RS-232 Cable Length and Macintosh Performance

==========

Article Created: 10 August 1992

TOPIC ----------

We have over 600 Macintosh computers on an AppleTalk network. The AppleTalk network is working fine. The problem is coming from the modem port. All of the computers are connected through this port to a Data General. We're using a terminal program called Pacer Link to access E-mail. The connection to the Data General is made through IAC boards, each capable of connecting up to 32 serial devices. From the IAC boards, the wiring goes to a punchdown block, and is routed to various offices using twisted pair.

We're currently purchasing numerous Macintosh IIsi computers. A significant number of these new computers can't see the Data General. All of these new computers are replacing computers that worked with the Data General just fine.

If the connection is moved from the modem port to the printer port, most of these new computers will then see the Data General and work just fine. So far, replacement of the logic board has made every computer recognize the Data General. We also have a Macintosh Portable that had a problem with the logic board. Before replacement of the logic board, the computer accessed the Data General. Now the computer doesn't see it. We put another new board in, and the Portable still doesn't see it.

We have tried a couple of things. The original cabling used pin 5 (RX-), pin 3 (TX-), and pin 4 (gnd). We tied pin 8 (RX+) to pin 4, but that didn't help. We moved the suspect computers to a location in the wiring closet within 50 feet of the Data General. Most of the Macintosh IIsi computers worked here, but the Portable didn't. We are currently checking the wiring to see if the Macintosh IIsi computers are all connected to the same IAC, or if there's some other common factor involved. Admittedly, some of these connections exceed the normal length limitations to send a serial signal. However, this system has been in place for about five years, and has worked well until now. I hate to keep replacing logic

boards if there's another solution to this problem. And in the case of the Portable, logic board replacement doesn't seem to be the solution.

DISCUSSION ----------

You specified that most or all cables are longer than 50 feet. You also mention that the cables are routed from the Data General to IAC boards, and from there to punch down blocks, and then finally routed out to the workstations via twisted pair. This can definitely be a problem. Here's an explanation.

RS-232-D Voltage Levels

RS-232-D uses unbalanced signal transmission. The voltage levels of RS-232-D are detected at the receiver as the difference between the signal circuit and the signal ground. This means that voltage at the interface point of an RS-232 circuit is measured relative to ground. Unfortunately, the transmitting and receiving stations usually have a different logic ground due to differences in their electronic components. As a consequence, a ground current can flow between the receiver and the transmitter. The wire has an electrical resistance, which produces a voltage drop. Therefore the signal detected by the receiver will appear differently than the signal sent by the transmitter.

If the difference is small, this potential difference won't cause any problems. However a signal of +5 volts with a ground potential difference of +3 volts means the receiver would see a +2 volt signal (an undefined transition region). A potential difference of -10 volts causes the receiver to see a 1 instead of the intended 0.

Cable Capacitance and RS-232

The cable capacitance specification of RS-232 can also present a problem. The standard states that the circuit capacitance isn't to exceed 2500 picofarads. A cable length of 50 feet is the maximum permitted distance because typical capacitance of multiconductor cable is 40 to 50 picofarads per foot. The end result of this is that transitions from 0 to 1 or from 1 to 0 take longer to achieve than permitted. This condition could result in the 1 bit being on for a longer period of time than the 0, or the 0 being on for a longer period of time than the 1. Either condition causes distortion of the signal, and possible problems with its reception and detection by the receiver.

We need the cable specifications to tell you how far to expect these connections to function. The RS-232-D specification states that it will function at distances of 50 feet. All Apple equipment will function within this specification when you use proper cable. As you replace the logic boards, you'll find some boards that work and others that don't. Differences in component types and tolerances can easily account for this.

Logic Board Components

You mention that the computers replaced by the Macintosh IIsi computers

worked fine with the exact same connections. As mentioned above, differences in component types and tolerances can easily account for the older systems working and the new Macintosh computers not working. This can also explain the reasons for some Macintosh IIsi computers working and some not.

There was a problem with some of the RC filters (RC2, RC3) that could cause the serial ports to fail. The RC filters you have in these affected Macintosh IIsi computers don't have the problem components. The date code was well beyond that of the affected filters. The Macintosh Portable was never affected by these component problems.

RS-422 Specification

The Macintosh Portable is designed to the RS-422 specification with the ability to meet the RS-423 specification. This means you can use it to communicate with most RS-232-D devices over distances up to approximately 50 feet. Shortening the cable to within specification or adding the "limited distance" modem (known as a "short-haul modem" in the U.S.) should resolve the connection problem.

Occasionally, computers can go beyond the RS-232 specification. However, if a computer works at lengths greater than 50 feet, it's considered the exception and not the rule.

The output power of all Macintosh models, including the Macintosh Portable, is completely within the EIA RS-423 specification. The RS-423 specification is designed to accommodate RS-232-D devices in an RS-422 environment. The RS-422 design is the Macintosh standard for serial ports and was chosen for its ability to carry serial signals over greater distances than the RS-232-D design. The RS-423 specification also encompasses the RS-232-C specification. This means that a device that conforms to RS-423 also conforms to RS-232-D.

The output power of most serial devices is determined by the line driver integrated circuits. The Macintosh systems in question all use the 23LS30 line driver IC, which is designed to meet the RS-422, RS-423, and RS-232-D specifications.

The RS-232-D specification states that a line driver output value more positive than +3 volts is considered ON (or SPACE or 0). The Macintosh serial ports provide a positive voltage level of +3.6 volts. The specification states that a line driver output level value more negative than -3 volts is considered OFF (or MARK or 1). The Macintosh serial ports provide a negative voltage of -3.6 volts. The output impedance specification is stated as greater than 300 ohms; the Macintosh serial ports provide 450 ohms.

Summary

One Macintosh works when the Macintosh Portable doesn't because the cable length falls outside the maximum distance stated in the RS-232-D specification of 50 feet (15.14 meters). Performance will be erratic and

unpredictable. Because of slight design differences, part variances, and environmental changes, one model of Macintosh (or even different units of the same model, or even the same unit at different times) may work at distances greater than 50 feet, while another may not. Once the specification has been exceeded, these results most likely will be inconsistent.

If you use a communications cable which is 50 feet or less, unshielded, 24 AWG, 52.5pF/meter, you can be assured that the configuration will function properly. Inexpensive short haul modems would seem to be the most cost effective solution to this difficult situation.

Connection Notes RS-423-A to RS-232-D

Maximum distance: 50 feet

If you use both wires in the twisted pair wiring, make sure that the signals present on each wire of the pair are traveling in the same direction.

PowerBook 100, 140, and 170: Fix Dates of Three Components

Revised: 5/17/94
Security: Everyone

PowerBook 100, 140, and 170: Fix Dates of Three Components

==========

Article Created: 27 October 1992

TOPIC ----------

How can I tell if my PowerBook has all of the known fixes installed already?

DISCUSSION ----------

Below is a list of the manufacturing cut-in dates for the Inverter Shield, Display Cable Shim, and Revision B Floppy Disk Drive:

Inverter Shield:
F2150XXX 140's built in Fremont
CK205XXX 170's built in Cork

Display Shim:
F2208XXX 140's built in Fremont
FCXXXXXX 140's built in Fountain
CK212XXX 140's built in Cork

Rev B Floppy Drive:
F2211XXX 140's 4/40 built in Fremont
F2212XXX 140's 4/80 built in Fremont
FC213XXX 140's built in Fountain
CK213XXX 140's built in Cork
CK213XXX 170's built in Cork

Notes:

1) If a PowerBook has been sent back to the Central Product Repair Center for repair, it may have one or all of these fixes already installed.

2) All PowerBook 100 external floppy drives were built before the Revision B floppy drive was available, so all external floppy drives are Revision A mechanisms unless they have been returned to the Central Product Repair Center or a dealer for repair.

3) The Display Cable Shim and the Inverter Shield haven't been identified as necessary on the PowerBook 100.

PowerBook: Battery Shelf Life (6/94)

Revised: 6/13/94
Security: Everyone

PowerBook: Battery Shelf Life (6/94)

==========

Article Created: 27 October 1992
Article Reviewed/Updated: 13 June 1994

TOPIC ----------

How long can I store my PowerBook battery?

DISCUSSION ----------

Apple uses three different types of batteries for PowerBook computers: Sealed Lead Acid (SLA), Nickel Cadmium (NiCad), and Nickel Metal Hydride (NiMH). Each type of battery has different storage life characteristics.

Sealed Lead Acid Batteries (SLA)

- 2 to 3 months - Battery should still have minimal charge to operate the PowerBook
- 12 to 18 months - Battery can still be charged
- 24 + months - Uncertain

Nickel Cadmium Batteries (NiCad)

- 1 to 2 months - Battery should still have minimal charge to operate the PowerBook
- 6 to 12 months - Battery can still be charged
- 24 + months - Uncertain

Nickel Metal Hydride Batteries (NiMH)

- 1 to 2 months - Battery should still have minimal charge to operate the PowerBook
- 6 to 12 months - Battery can still be charged
- 24 + months - Uncertain

NOTE: The PowerBook Intelligent Battery (NiMH) has improved charging abilities and has the following characteristics:

- A fully charged battery has a six month shelf life
- If the battery is discharged in sleep as far as it will go to the point that the computer goes into shutdown, the computer can stay in this state for six weeks.

Batteries may be damaged if stored for prolonged periods with a closed circuit. The environmental temperature will also affect the storage life of any battery. Cool environments are best, and are assumed for the above estimates. All storage times are based on storage starting with the battery fully charged.

Article Change History:
13 June 1994 - Updated to include information on the PowerBook Intelligent Battery.

PowerBook: What To Do When It Won't Run On the Battery (11/94)

Revised: 11/7/94
Security: Everyone

PowerBook: What To Do When It Won't Run On the Battery (11/94)

==========

Article Created: 27 October 1992
Article Reviewed/Updated: 07 November 1994

TOPIC ----------

This article discusses why a PowerBook may not run on the battery, but will operate normally when plugged into AC power. Issues surrounding a damaged O ring on the power adapter tip have been resolved by Apple.

DISCUSSION ----------

PowerBook 100

- Check that the storage switch on the back of the computer next to the power connector is in the up position. This switch disables all battery power, but will allow you to use the unit with AC power.

- A fuse on the logic board may blow if the lithium batteries aren't removed before the unit is taken apart. It's also important that the unit is completely reassembled before the batteries are reinstalled. The logic board can be shorted out quite easily since the keyboard is a part of the circuit. The symptom of the failure is that the PowerBook will run on the AC Adaptor, but not on the battery.

- A blown fuse may be linked to a damaged or defective power adaptor. In particular, the black insulating "O" ring on the tip of the adaptor may be damaged and shorting out against the logic board. Replacement of the power adaptor and the main logic board will fix the problem.

PowerBook 140, 160, 170, and 180

On these computers, a blown fuse may be linked to a damaged or defective power adaptor. In particular, the black insulating "O" ring on the tip of the adaptor may be damaged and shorting out against the logic board. Replacement of the power adaptor and the main logic board will fix the problem.

A new logic board design includes a replaceable fuse. Part numbers for the revised logic boards are as follows:

PowerBook 140, 145, 145B, and 170 computers
661-0708

PowerBook 160, 165, and 180 computers
661-0746

PowerBook 165c and 180c computers
661-0765

PowerBook 150

The PowerBook 150 will show similar symptoms as the PowerBook 140 and 170 with a blown fuse. The unit will run with the AC Adapter connected but not from battery only. Additionally, the unit will not run from AC Adapter power if the battery is removed. Check the logic board fuse if it fails to run from battery.

Article Change History:
07 Nov 1994 - Added part number information for replaceable fuse logic boards.
31 Aug 1994 - Information on damaged O ring added to PowerBook 100 section.
18 Jul 1994 - Added PowerBook 150.

PowerBook: What Causes Duplicate Faxes (11/92)

==========

Article Created: 27 October 1992

TOPIC ----------

The FaxSender software I got with my PowerBook keeps resending the same group of faxes.

DISCUSSION ----------

If you put a queue of faxes in, and one of those numbers is unreachable, the FaxSender software will send the fax to the whole queue each time it retries the number that can't be reached. This seems to occur when you have four fax machines in queue.

PowerBook: Identifying Inverter Board Revisions (11/92)

==========

Article Created: 27 October 1992

TOPIC ----------

The Service Price Pages for the PowerBook 140 show a Revision A and a Revision B of the inverter board, but don't describe them the way the Technical Procedures do.

DISCUSSION ----------

The Technical Procedure Manuals describe them as "RED" and "BLUE" to match the color of the display cable. The Illustrated Parts List does list them to match the Technical Procedure Manuals. Here's how they correlate:

Part Number 699-0271 = Rev A = Blue
Part Number 699-0272 = Rev B = Red

PowerBook: Modem Drops Line (11/92)

Revised: 5/18/94
Security: Everyone

PowerBook: Modem Drops Line (11/92)

==========

Article Created: 27 October 1992

TOPIC ----------

I'm using a PowerBook 140 with the optional internal Apple Fax/Data Modem and different software packages for connecting to a mainframe computer. The modems will appear to connect, but as soon as they do, they disconnect. I can plug in an external modem and use the same software to connect with no problems.

DISCUSSION ----------

The Apple PowerBook Fax/Data Modem uses a number of error correction and data compression protocols to increase the efficiency of data transfer. Normally, if the remote modem doesn't support the same features, the PowerBook modem turns off the extended feature set and retransmits the data using normal protocols. Certain modems don't allow the PowerBook modem time enough to turn off these features, and they drop the connection.

A workaround for this situation is to manually turn off the error correction protocols in the PowerBook modem every time you're connecting to a system and experience these problems. This can be done by entering "&Q0" (ampersand, letter Q, number zero) in the modem string section of your software or between the "AT" and the "DT" of the dial command. You can find this command on page 102 of the Fax/Data Modem User's Manual.

What is stored in the Parameter RAM of the PowerBooks, in addition to the standard System 7 settings?

DISCUSSION ----------

PowerBooks save the following Portable control panel information in Parameter RAM:

- Minutes Before System Sleep (8 Minutes)
- Minutes Before Hard Disk Sleep (4 minutes)
- Macintosh PowerBook Rest (default is Rest)
  To change the default on a PowerBook 100, 140, 145, or 170, hold down the option key in the Portable control panel, and click "Minutes before Automatic Sleep." To change the default on a PowerBook 160, 180, or Duo, hold down the option key and click on the Options button.
- Stay awake when plugged in (default is unselected)
- Modem Selection (default is internal for any PowerBook running a version of MacOS earlier than System 7.5. For System 7.5, the default is external.)
- Wake on Ring (default is unselected and can be changed in the Portable control panel for Internal Modem)

The PowerBook 170 also stores:

- Power Saver on the PowerBook 170 (default is Off).

Article Change History:
23 Sep 1994 - Added info on System 7.5.

PowerBook: Hard Disk Intermittently Available (11/92)

==========

Article Created: 28 October 1992

TOPIC ----------

When I use the power adapter on my PowerBook, the hard disk disappears intermittently. Then I see the flashing question mark. I don't have any problems starting up with a battery. Why is this?

DISCUSSION ----------

The most probable cause for this type of problem would be a faulty power adapter. It's possible the filter network in the power adapter is leaking some AC noise and affecting the SCSI signals. It's also possible that the power adapter is supplying a marginal voltage -- enough to power on the logic, but not enough to spin up the hard drive.

The problem you described may also be caused by the main logic board. The main logic board also has a filter for external power which, if it's faulty, can also affect the SCSI signals or SCSI chip.

MacX: Positioning Windows with Multiple Monitors

Revised: 10/2/92
Security: Everyone

MacX: Positioning Windows with Multiple Monitors

==========

Article Created: 25 September 1992

TOPIC ----------

On a system with multiple monitors, MacX assumes that the logical tops of the screens are at an equal height. For example, on my system, I have an Apple 13-inch RGB and a Radius TPD. The RGB is slightly lower than the TPD, and is to the left of it. I have changed positioning in the Monitors control panel to reflect this. When bringing up a client application in rootless mode, MacX can position it at the top of the bounding rectangle formed by both monitors, therefore positioning it "off the top" of the RGB monitor, and rendering the window inaccessible.

I can work around this by running in rooted mode, or by positioning the logical tops of the screens so that they are equal.

DISCUSSION ----------

This behavior is known, and in fact, it is documented in the PATHWORKS for Macintosh, MacX User's Guide, page 65. To move the windows, use the Temporarily Adorn command or the Option key as described in the same manual, on pages 68-69.

The position in which a DECwindows client window appears when you open it is preset. Usually the client window appears approximately in the middle of the screen. Occasionally, in the preset position only part of the window might be visible, or the window might not be visible at all. This situation might occur if you have more than one monitor connected to your Macintosh.

In the Macintosh environment, the desktop extends across all monitors connected to the same workstation. Because of the different sizes of monitors and the ways in which they can be positioned relative to one another (using the Monitors control panel), the Macintosh desktop can have portions that are not visible.

When DECwindows attempts to position a window in the nonvisible part of the desktop, the MacX Window Manager takes over and places the window near the desktop's point of origin (the upper-left corner). If more than one window needs to be placed, MacX positions the windows in a cascading sequence. MacX automatically places a window on the largest monitor best-suited to display it; for example, it puts a color window on the largest color monitor available.

System 7: Saving Chained Documents as PostScript Files

Revised: 8/13/92
Security: Everyone

System 7: Saving "Chained" Documents as PostScript Files

==========

Article Created: 21 July 1992
Article Last Reviewed:
Article Last Updated:

TOPIC -----

Some programs, like Microsoft Word and FrameMaker, let you specify what file to print after the current file. Using this feature, you can split a long or complex document into multiple files and still have them act as one chained document when printing.

Under System 6, if you wanted to save these multiple files as PostScript files for a chained document, you could send the first file to print and immediately press and hold Command-K (if you're using Laser Prep) or Command-F (without Laser Prep) while all jobs printed, and these files would be saved as PostScript files.

I tried this under System 7, and the first file was saved as PostScript, but the remaining files were printed.

How can I get a chained document saved to PostScript under System 7?

DISCUSSION -----

There doesn't seem to be a direct workaround under System 7. Neither Microsoft Word nor FrameMaker preserves the same print record for all the jobs; that is, they don't display the job or print dialog for all print records they use to print. Therefore, the 7.X driver can't give the user an option to save the remaining files to PostScript.

With the 6.X driver, the choice to save to a PostScript file was done by checking the keyboard when imaging began. If the driver sensed that Command-K or Command-F was pressed, the files were saved as PostScript. This method didn't require a print dialog for each file -- although you did have to continue pressing Command-K or Command-F while all jobs were

printing.

Workarounds

There are two workarounds you can use:

• Go back to System 6 and use the LaserWriter 6.X drivers.

• Use the LaserWriter 6.X drivers under System 7. Here's how:

  1) Drag a copy of the LaserWriter 6.X driver (and Laser Prep) to the top level of the System Folder.

  2) Select this driver in the Chooser.

  3) Turn off Background Printing.

  4) Ensure that you are not using TrueType fonts.

  5) When you print the first of the chained files, immediately press and hold Command-K (or Command-F) until the job has finished printing.

Note

You can create a maximum of 10 PostScript files, named PostScript0 through PostScript9, with this method. If you try to create more than 10, the 11th job will overwrite PostScript0, the 12th job will overwrite PostScript1, and so on.

Security: Everyone

PowerBook: When Application Processing Slows Down (4/95)

==========

Article Created: 21 August 1992
Article Reviewed/Updated: 03 April 1995

TOPIC ----------

I'm using some mathematics software on the PowerBook 170. When the application is processing an equation and plotting the results on the screen, the system slows down, then halts screen plotting. Moving the trackball seems to "wake up" the system, and plotting continues. This occurs whether the unit is plugged in or under battery power.

Is this a known problem, and is there a workaround?

DISCUSSION ----------

The power consumption of the PowerBook's microprocessor is reduced automatically when it detects that no activity requiring its attention has taken place for a period of time. This feature is called "system rest" in System 7.0; it is called "processor cycling" in System 7.0.1 or later.

The microprocessor comes back up to speed instantaneously when you resume using the computer. You don't need to do anything for system rest or processor cycling to take effect. But this may be the cause of your problems. Try turning off system rest or processor cycling while using the program.

To turn off system rest in System 7.0.1 (using the Portable control panel):

1) Choose Control Panels from the Apple menu, and open the Portable control panel.

2) Hold down the Option key while clicking "Minutes Until Automatic Sleep."

3) Click Don't Rest.

4) Click OK.

To turn off processor cycling in System 7.1 or greater (using the PowerBook control panel):

1) Choose Control Panels from the Apple menu, and open the PowerBook control panel.

2) Hold down the Option key on the keyboard and click the Options button.

3) Click "Don't allow cycling."

4) Click OK.

Important: To conserve power most efficiently, turn off system rest or processor cycling only when using a program that interferes with this feature. Turn system rest or processor cycling back on again as soon as possible. This feature is turned back on automatically the next time you choose Restart or Shut Down.

Article Change History:
03 Apr 1995 - Reviewed for technical accuracy.
16 Aug 1993 - Added changes in terminology as of System 7.1.

Article Created: 21 August 1992

TOPIC ----------

I want to emulate the LK201 keyboard when using MacTerminal to connect to the DEC system "All in One Office Automation." Menu F-keys work fine, but I want to use physical F-keys on an extended keyboard, specifically F10 to exit. Using the MacTerminal VT320 Keyboard Emulation doesn't work.

DISCUSSION ----------

According to the VT320 Tool section in the MacTerminal 3.0 User's Guide, there are three ways to emulate the functions provided by the function keys on the VT320 keyboard:

1) Regardless of the keyboard you have, the Keys menu provides selections that function identically to VT320 function keys.

2) In addition, the Extended ADB keyboard contains Function keys that you can use to emulate the VT320 function keys. However, the Extended ADB keyboard contains Function keys F1 through F15, while the VT320 keyboard contains Function keys F6 through F20. The discrepancy is resolved by mapping Fx on the Extended ADB keyboard to F(x+5) on the VT320. For example, to generate a VT320 F6, use F1 on the Extended ADB keyboard.

3) You can also generate Function keys on the Macintosh keyboards by using the Keypad keys in combination with the Option key, as shown in this table:

Macintosh keypad	plus OPTION equals	Function keys
Clear		F5
=		F6
/		F7
*		F8

7	F9
8	F10
9	F11
-	F12
4	F13
5	F14
6	F15
+	F16
1	F17
2	F18
3	F19
.	F20

For user-defined VT320 function keys, hold down the Shift key and the Option key, while pressing the appropriate keypad key.

The question is whether these F-keys you want to use are VT320 F-keys or LK201 F-keys. When you use a real DEC VT320 terminal with the application, you press F10 to exit, but using MacTerminal 3.0 with the VT320 Tool, you should press F5 on the extended keyboard (offset of 5). You can also use the Macintosh keypad 8 and the Option key to generate F10.

If this still doesn't work for your LK201 keyboard, you may want to check into using a macro program such as QuicKeys to map the function keys. This is much easier than trying to map the resources in the VT320 Tool.

DAL: DESCRIBE Statement and Accessing Data Dictionary (8/94)

Revised: 8/31/94
Security: Everyone

DAL: DESCRIBE Statement and Accessing Data Dictionary (8/94)

==========

Article Created: 21 August 1992
Article Reviewed/Updated: 31 August 1994

TOPIC ----------

Is it possible to access the data dictionary information in a DB2 database from DAL? We can query against our tables using third-party products like DataPrism and ClearAccess. The problem is that we may not know what a "sale" means in different tables.

For example, in one table a sale field might mean that the product had an invoice filled out, but not shipped yet. In another table, sale might mean the product was shipped, but money wasn't collected yet. Another table might define sale as product shipped and money collected.

When we query against the database, we have to access the data dictionary to determine the meaning of the fields. Without the ability to access the data dictionary, users can query and get information that may not be what they were expecting, based on the definition.

DISCUSSION ----------

DAL provides information about the structure and organization of entities that it manipulates through a special data-manipulation statement. Using the DESCRIBE statement, the client application can determine the names and data types of the entities stored in the database and any implicit relationships among them. The client application can have DAL describe:

- The supported DBMS brands on a particular host system
- Available databases for a particular brand
- Currently open DBMS brands and databases
- The tables in a database
- The columns in a table
- The linksets in a database

The DESCRIBE statement generates a rowset containing the requested definition in

the same way as the SELECT statement creates rowsets.

The DESCRIBE COLUMNS statement is probably what you need, because it returns, among other fields, the column title and column remarks. For more information regarding the DESCRIBE statements, please refer to the DAL Programmer's Reference, available from APDA, part number M0877LL/B.

With a license agreement between Apple Computer and ITI (Independence Technologies, Inc.), ITI will market DAL products and provide all support to DAL customers. To locate ITI's address and phone number, use ITI as a search string.

PowerBook Modem: Getting It to Ignore the Dial Tone 8/92

Revised: 5/16/94
Security: Everyone

PowerBook Modem: Getting It to Ignore the Dial Tone 8/92

==========

Article Created: 21 August 1992

TOPIC --

I have a PowerBook, which I use to fax documents. Some phone systems have a different kind of dial tone, so I make a manual connection and the Fax software works. Is there another way to send a fax and ignore the dial tone?

DISCUSSION --

Normally you could enter an X1 modem command either manually or through a modem script to tell the modem to ignore dial tone, but with the Fax Sender software that isn't possible. One workaround is to enter a comma as the first character of the phone number (that is, ",408-555-1212"). A comma is intended to insert a pause in the dialing sequence, but one of the side effects is that everything after the comma is blind dialed, ignoring dial tone. It's an odd but effective way to use the modem when it doesn't recognize dial tone.

Macintosh: Replacement Case Screws

Revised: 12/8/92
Security: Everyone

Macintosh: Replacement Case Screws

==========

Article Created: 30 November 1992

TOPIC ----------

What is the size of the machine screw used to fasten the cover of the Macintosh II, IIcx, IIci, LC, IIsi, Quadra 700, and Quadra 900? This screw is no longer packaged with the machines and I would like to keep users from stealing components.

DISCUSSION ----------

The screw is a metric screw, so its specification looks very different from SAE specs. The spec reads the diameter first, the length, and then the pitch, all in millimeters. Generally speaking, a Phillips Pan Head is most common, but if you want to lock the machines up you may want to try a tamper-proof screw (one way) or perhaps an Allen, Torx™, or Robertson head. You do not need an integral lock washer as the internal screws use (commonly called a SEMS screw).

The screw is called a M3.5 x 12 x .8. You may want one about 10 millimeters long for some of the systems (such as the IIsi), but 12mm is a good all-purpose length.

Macintosh Quadra 900 and 950: Layout of SIMM Banks

Revised: 9/17/92
Security: Everyone

Macintosh Quadra 900 and 950: Layout of SIMM Banks

==========

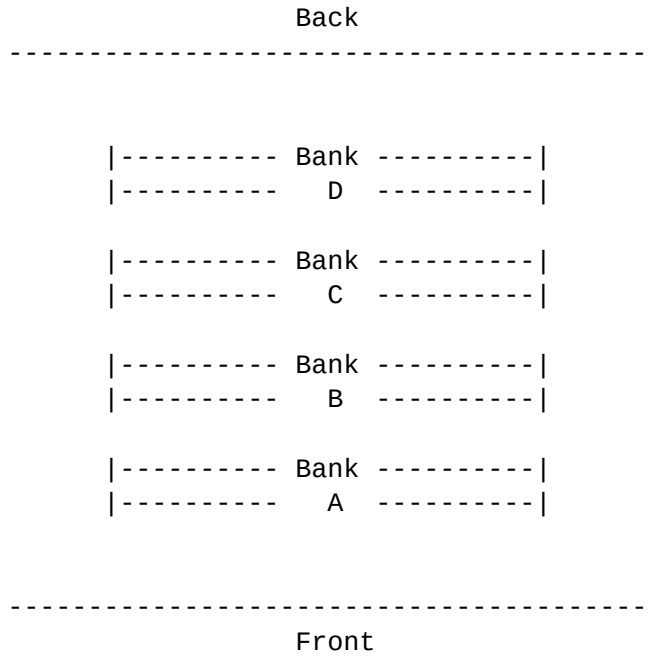
Article Created: 27 August 1992

TOPIC -----

This article discusses the layout of the Macintosh Quadra 900 and 950 SIMM banks and provides memory configuration and dynamic RAM (DRAM) information.

DISCUSSION -----

The layout of the DRAM SIMM banks for Macintosh Quadra 900 and 950 differs from other Macintosh models, which are aligned vertically. The Macintosh Quadra 900 and 950 have four SIMM banks that are aligned horizontally with two slots on the left and two slots on the right as shown in this diagram.



- The Macintosh Quadra 900 and 950 accept standard 1MB or 4MB SIMMs rated at 80 ns or faster. Although acceptable, there is no speed improvement when using RAM rated faster than 80 ns because the memory control unit (MCU) is programmed for 80 ns RAM.

- Each slot in a given bank must be either empty OR fully populated with four SIMMs of the same size and same speed. If a bank is either not empty or not fully populated with SIMMs of the same size, you will hear chimes at startup, indicating a hardware failure.

- Apple's documentation states that all filled banks must use SIMMs of the same speed. You cannot mix RAM SIMMs of different speeds, even between banks.

- Each bank is independent; therefore, you can populate the banks in any order. For example, four 1MB SIMMs in bank B and four 4MB SIMMs in bank D is an acceptable configuration.

- The available memory configurations for the Macintosh Quadra 900 and 950 are 4, 8, 12, 16, 20, 24, 28, 32, 36, 40, 48, 52, and 64MB of RAM.

Memory expansion kits are available from Apple. Contact your authorized Apple Service Provider for price and installation information.

Notes

- When large amounts of DRAM are installed, the memory check at startup is lengthy. There is no software indication that the system is running the memory check.

- The use of 16MB SIMMs has not been thoroughly tested with these Macintosh computers and, therefore, available memory configurations when using 16MB SIMMs are not included in this article.

- The use of 256K and 2MB SIMMs is not supported for these Macintosh models.

SNA•ps 3270 and 3270 GC: Comparison

Revised: 9/15/92
Security: Everyone

SNA•ps 3270 and 3270 GC: Comparison

==========

Article Created: 6 August 1992

TOPIC --

Which 3270 terminal emulation package should I buy, SNA•ps 3270 (M0499Z/B) or SNA•ps 3270 GC (M1220Z/B) ?

DISCUSSION --

SNA•ps 3270 should be used for direct connections from a Macintosh to IBM mainframes over coax, SDLC, or Token Ring cabling. This means that the Macintosh is connecting directly to the mainframe without going through an AppleTalk LAN gateway (such as the Apple SNA•ps Gateway software running on a Macintosh CPU).

Conversely, the SNA•ps 3270 GC (Gateway Client) software IS intended to run in an AppleTalk LAN where one or more SNA•ps Gateways are installed. The user's Macintosh communicates to the SNA•ps Gateway using AppleTalk (over LocalTalk, Ethernet, or Token Ring cabling) with the SNA•ps Gateway Macintosh connected to the mainframe over SDLC or Token Ring cabling.

SNA•ps Gateway: Meaning of Versions 8, 32, and 64

==========

Article Created: 6 August 1992

TOPIC --

What's the difference between the SNA•ps Gateway versions: SNA•ps Gateway/8, SNA•ps Gateway/32, and SNA•ps Gateway/64?

DISCUSSION --

The three products are functionally identical except for the number of LUs (Logical Units) they support: 8, 32, or 64. Logical Units are defined in IBM's Systems Network Architecture (SNA), and equate roughly to the number of sessions that can be concurrently running between Macintosh clients and IBM mainframes.

Macintosh Coprocessor Platform (MCP) Card: RAM Upgrade (4/95)

Revised: 4/21/95
Security: Everyone

Macintosh Coprocessor Platform (MCP) Card: RAM Upgrade (4/95)

==========

Article Created: 6 August 1992
Article Reviewed/Updated: 21 April 1995

TOPIC ----------

This article briefly describes what Macintosh Coprocessor Platform (MCP) cards are, and tells you where to find upgrades for them.

DISCUSSION ----------

MCP is an Apple trademarked name for an intelligent processor card design incorporating a 68000 CPU, 512K RAM, and multitasking operating system on NuBus card. Apple's Coax/Twinax, TokenTalk NB, Token Ring 4/16 NB, and Serial NB are all MCP cards.

The SNA•ps Gateway software was designed to run on an Apple MCP card, a design that frees the main CPU memory and processor to run other applications more effectively.

Memory for these cards can be difficult to locate. However, if you want to upgrade MCP card RAM, the following information will be helpful:

• Toshiba part No. TC514400AZ (from third-party distributors)

Article Change History:
21 Apr 1995 - Updated memory part number and availability information.

SNA•ps Gateway: Software Package

Revised: 9/15/92
Security: Everyone

SNA•ps Gateway: Software Package

==========

Article Created: 6 August 1992

TOPIC ----------

Do the SNA•ps Gateway packages include a copy of SNA•ps 3270 GC, and a hardware card for host connections?

DISCUSSION ----------

The SNA•ps Gateway doesn't include any application software other than its administration and configuration programs. SNA•ps 3270 GC, or SNA•ps-compatible third-party applications, must be purchased separately for each Macintosh user who will access the SNA•ps Gateway.

SNA•ps Gateway packages don't include a hardware card for host connections. SNA•ps is a family of software-only products that provide Macintosh user access to IBM host systems. The SNA•ps Gateway software runs on Macintosh computers that have an Apple Coax/Twinax Card (for coax cabling), Apple Serial NB Card (for SDLC cabling), or an Apple Token Ring 4/16 NB Card (for Token Ring cabling) installed.

Using Screen Savers With LCDs (2/95)

Revised: 2/15/95
Security: Everyone

Using Screen Savers With LCDs (2/95)

==========

Article Created: 4 March 1992
Article Reviewed/Updated: 15 February 1995

TOPIC ----------

Do LCDs, like those used with the Macintosh PowerBook and Macintosh Portable, suffer from burn-in like CRTs used with desktop Macintosh computers?

Are screen savers recommended for the Macintosh PowerBook series?

DISCUSSION ----------

An image left on an LCD screen for an extended period (approx. 24 hours, depending on the image) can leave a "ghost" image. Unlike CRTs, an LCD will recover over time and eventually erase the ghost image.

To allow this recovery, either shut down the system or put it into sleep. The time it takes to recover depends on the original image and how long the image was left on the screen. It generally takes between one and two times as long to remove the ghost image as it took to create it.

With regards to a screen saver, using the sleep feature or shutting down the PowerBook when it won't be used for extended periods should reduce the need for a screen saver. However, if you still would like to use one, be sure you choose one that is appropriate for your PowerBook model.

Active Matrix Display Models

PowerBook computers with Active Matrix displays include the PowerBook 170, 230, 180, 180c, 540, 540c, PowerBook Duo 250, 270c, 280, and 280c. With these computers, you should use a screen saver image with a completely white background. Below are two screen saver examples for use with active matrix displays and After Dark:

• In MacDraw Pro, or other similar application, create a completely white document by drawing a page-size white-filled box and then saving the file as a

PICT image. Use this file in conjunction with the Picture Frame module within After Dark to produce a white background screen-saver image.

• WhiteOut is a stand-alone After Dark module.

Passive Matrix Display Models

The PowerBook 100, 140, 145, 145B, 150, 160, 165c, 520, 520c and PowerBook Duo 210 use a Passive Matrix Display. With these displays, like the monitors used with our desktop computers, you can use a standard screen saver that displays a dark background.

Article Change History

15 Feb 1995 - Added specific models for Active and Passive Matrix Displays.
26 Sep 1994 - Reviewed for technical accuracy, removed attachments.
20 Aug 1992 - Changed title, defined appropriate screen-saver type for each PowerBook model.

AppleTalk Remote Access: Initiating a Telnet Session

==========

Article Created: 25 September 1992

TOPIC -----

Can I use Telnet across AppleTalk Remote Access? Do I need MacTCP on both computers, and will dynamic addressing work?

DISCUSSION -----

Yes, Telnet sessions can be initiated from a remote Macintosh using AppleTalk Remote Access and MacTCP. MacTCP only needs to be on the remote Macintosh; the host Macintosh only acts as an AppleTalk bridge. MacTCP behaves as if it were on LocalTalk; dynamic addressing does work.

For more details, read the Tech Info Library article "AppleTalk Remote: Troubleshooting Inability to Reach TCP/IP Host"

MacMainFrame for PATHWORKS: DECnet to IBM Connectivity

Revised: 9/17/92
Security: Everyone

MacMainFrame for PATHWORKS: DECnet to IBM Connectivity

==========

Article Created: 9 September 1992

TOPIC ----------

Is there 3270 Terminal Emulation software that runs on the Macintosh via the DECnet protocol?

I want to use 3270 terminal emulation to the VAX. The VAX would be the gateway to a 3090 mainframe. The protocol between the VAX and the 3090 would be SNA.

DISCUSSION ----------

MacMainFrame for PATHWORKS allows Macintosh computers in a DECnet environment to connect to an IBM host via Digital Equipment Corporation's DECnet/SNA Gateway.

Macintosh computers must be equipped with PATHWORKS for Macintosh and MacMainFrame for PATHWORKS software in order to establish host connections through the DECnet/SNA Gateway. PATHWORKS allows Macintosh computers to use DECnet to connect directly to a DECnet/SNA Gateway that resides on the network. PATHWORKS also lets Macintosh computers use AppleTalk to connect to the DECnet/SNA Gateway via PATHWORKS' built-in AppleTalk-to-DECnet gateway software. Once the Macintosh is connected to the DECnet/SNA Gateway, MacMainFrame for PATHWORKS instructs the gateway to establish host sessions.

Once a Macintosh in the DECnet environment is connected to the host, users can take full advantage of all MacMainFrame features including IBM 3278/3279 terminal and 3287 printer emulation, copy and paste, keyboard remapping, pull-down and tear-off menus, jump key facilities, customizable color palettes, Easy Keys, on-screen font size selection, System 7 support, and DO structured field-based file transfer.

Users can access financial, word processing and electronic mail host applications and can copy and paste information into Macintosh applications

including Microsoft Excel, Word, and so on. MacMainFrame's multi-session capability allows users to have up to eight host sessions open at one time. And the software's multi-server feature allows users to connect to more than one DECnet/SNA Gateway and to more than one IBM host simultaneously.

Custom applications developed with the MacMainFrame Programmer's Toolkit Application Programming Interface (API) are compatible with MacMainFrame in the DECnet environment.

MacMainFrame for PATHWORKS also supports Avatar's MacMainFrame Graphics -- an optional software package that allows users to edit mainframe graphics packages on the Macintosh. In addition, MacMainFrame for PATHWORKS also supports FrontCard, Avatar's HyperCard-based programmer's toolkit for custom 3270 interface development.

MacMainFrame Workstation for PATHWORKS is available directly through Avatar or Digital Equipment Corporation. Site licenses are available.

Quadra: ARA and Practical Peripherals Modem Issue (9/94)

Revised: 9/26/94
Security: Everyone

Quadra: ARA and Practical Peripherals Modem Issue (9/94)

==========

Article Created: 20 October 1992
Article Reviewed/Updated: 26 September 1994

TOPIC ----------

I'm using AppleTalk Remote Access (ARA) on a Macintosh Quadra 700 to connect to a Macintosh IIfx. Both Macintosh systems are using Practical Peripherals 9600sa modems.

When the MC68040 processor caches are enabled on the Quadra 700 and an ARA connection is initiated to the Macintosh IIfx, the modems communicate, but a connection can't be made.

ARA generates a message saying that it's communicating at 9600, but the "connected" message and the clock never appear on the screen. After a minute, the connection times out and disconnects. When the processor caches are disabled, it works fine. Two different Macintosh Quadra 700 systems have this problem.

What is the cause of this problem, and is there a workaround?

DISCUSSION ----------

The problem you are experiencing is actually due to the command handling speed of the modem, and can be fixed with a new script. Macintosh Quadra systems issue CCL instructions too quickly for the Practical Peripherals 9600SA to respond. This problem may exist on other modems as well.

The solution is to insert a suitable "pause" before each write command in the CCL script. Testing on a Macintosh Quadra 700 with the "Practical Peripherals 9600SA" script indicates "pause 1" gives 275ms delay, "pause 2" gives 375ms, and so on. A "pause 1" should be sufficient for any modem. One side effect is that the entire dial/connect sequence takes approximately one second more.

Contact Practical Peripherals for an updated script or information on how to modify your current script to add this pause.

PowerBook 145: Peculiarities With System Software Version 7.0.1

Revised: 5/18/94
Security: Everyone

PowerBook 145: Peculiarities With System Software Version 7.0.1

==========

Article Created: 2 September 1992

TOPIC ----------

The Macintosh PowerBook 145 ships with system software version 7.0.1. Because version 7.0.1 was released before the PowerBook 145 was introduced, the system software doesn't contain information with which to report this computer as a PowerBook 145.

This article addresses some peculiarities you may notice.

DISCUSSION ----------

About This Macintosh ...

When you check the "About This Macintosh ..." item in the Apple menu, it shows PowerBook 140. However, both the product label on the bottom case and the silkscreen on the display bezel correctly show the model as a Macintosh PowerBook 145.

Installing System Software

If you select "Custom Install", there is no Installer script labeled PowerBook 145. Choose the script labeled PowerBook 140 to install the proper software.

If you select "Easy Install", the correct software will be installed.

These items have been fixed in system software version 7.1.

PowerBook 145: Power-Saver Mode In System 7.1, Not 7.0.1 9/92

==========

Article Created: 2 September 1992

TOPIC ----------

Can I put the Macintosh PowerBook 145, which runs at 25 MHz, into power- saver mode (16 MHz) via the Battery desk accessory, like the PowerBook 170?

DISCUSSION ----------

No, with system software version 7.0.1, you cannot slow the Macintosh PowerBook 145 processor down to 16 MHz.

This feature is available with System 7.1. It's been moved from the Battery DA to an option in the new PowerBook control panel.

Note

If the PowerBook 145 had its expansion board replaced with the PowerBook 170 board, you can put it into power-saver mode via the Battery DA with version 7.0.1.

Revised: 5/19/94
Security: Everyone

System 7.1: PowerBook and Macintosh Portable Installer Scripts

==========

Article Created: 2 September 1992

TOPIC ----------

Will system software version 7.1 include custom installer scripts for the entire Macintosh PowerBook series? Or, will we have a similar situation to the PowerBook 145 introduction that is discussed in article "PowerBook 145: Peculiarities With System Software Version 7.0.1"?

DISCUSSION ----------

System software version 7.1 will include custom installer scripts for these PowerBook and Portable products:

- Macintosh Portable
- Macintosh PowerBook 100
- Macintosh PowerBook 140/145
- Macintosh PowerBook 170

The new PowerBook products being introduced in fall 1992 each include an "Install Me First" disk (referred to as a "System Enabler") with system software version 7.1 installation disks.

This System Enabler disk includes minor changes to the system software shipped with the new product that are specific to that product.

Macintosh: Switched 56K Connection from MultiAccess

==========

Article Created: 20 October 1992

TOPIC ----------

Will the Apple ISDN card work with a Switched 56 leased line?

DISCUSSION ----------

No. Switched 56 is a synchronous 56Kbps dial-up data link. It isn't ISDN.

A 56K card for the Macintosh is available from MultiAccess Computing Corporation. It offers Switched 56K connection. Here's some information on this card:

MCC-256 -- Switched 56K connection for the Macintosh
- Supports applications in Switched 56K Service as well as leased 56K (DDS) and fractions T1 at 192 Kbps
- V.35/RS-422 HDLC message encapsulation with error detection
- RS-366 or V.25 bis automatic dialing control
- RS-232 auxiliary port for disaster recovery or additional bandwidth
- Standard Apple NuBus form factor

To locate a vendor's address and phone numbers, use the vendor name as a search string.

This article describes the HOPS (Heuristic Optimized Processing System) software available from HOPS International, Inc.

DISCUSSION ----------

HOPS speeds up indexing, sorting and algebra operations in relational databases. You can use it on a Macintosh with 5MB of RAM and appropriate storage.

HOPS features a series of algorithms that speed up indexing, sorting and algebra operations in relational databases on the Macintosh. For example, 100,000 records can be fully indexed in 25 seconds, or 1,000,000 records in three minutes. Only one disk access is required per seek, even when dealing with a billion or more records. Sorts, Boolean scans, insertions, and so on, are equally as fast.

During coding, a "seed" is described via a simplified definition module and inserted into a host program (Pascal, C, and so on). Although this insertion is somewhat analogous to the insertion of subroutine, the magnitude and complexity of tasks that can be accomplished with a single "seed" serves to distinguish this tool.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

LaserWriter IIf, IIg, NTR: Setting Serial Timeouts

Revised: 9/22/92
Security: Everyone

LaserWriter IIf, IIg, NTR: Setting Serial Timeouts

==========

Article Created: 16 September 1992

TOPIC ----------

We have a number of LaserWriter IIf and LaserWriter IIg printers that have active serial connections to terminal servers. We have VAX print queues pointed at the terminal server ports so that users can access the printers.

When we send a print job to the printer's serial port, it prints the job and then goes into a "busy, status:Waiting" state. The printer stays in this state for 5 minutes, after which it returns to an idle state. During this time, additional print jobs sent to the serial port will print, but jobs sent to the LocalTalk or Ethernet ports won't print. These jobs must wait until the printer goes back to its idle state.

A possible solution to this problem would be to reduce the timeout period on the printer from 5 minutes to something less (for example, 30 seconds). We can do this by sending a PostScript command to the printer. What is the specific command?

DISCUSSION ----------

Here is the PostScript Level 2 program to change the "WaitTimeout" value in the LaserWriter IIf and IIg, and Personal LaserWriter NTR:

```
<</WaitTimeout xx
  /Password (yy)
>> setsystemparams
```

"xx" is the timeout value in seconds and "yy" is the system password. If the system password is zero (the default), it's okay to leave out the "/Password" line. For example, if you want to change the "WaitTimeout" value to 30 seconds and have zero for a password, either one of the following PostScript Level 2 programs will do the job:

```
<</WaitTimeout 30
```

```
>> setsystemparams

or

<</WaitTimeout 30
  /Password (0)
>> setsystemparams
```

More important than changing the "WaitTimeout" value is properly terminating print jobs sent to the serial port. You do this by ending any print job with the CTRL-D character which is also known as an end-of-file character (eof). The CTRL-D character has an ASCII value of $04. If this character is sent at the end of a print job, there will be no waiting at all for the serial port to time out.

LaserWriter: Problem Printing Linked Files as PostScript

Revised: 11/11/92
Security: Everyone

LaserWriter: Problem Printing Linked Files as PostScript

==========

Article Created: 20 October 1992

TOPIC ----------

I want to create PostScript files from linked documents in Word 5.0 and FrameMaker. I've used Command-K when printing to create the PostScript files, and they were numbered 0 through 9.

Now, if I select PostScript File in the Print dialog, it saves the first linked document as a PostScript file, then sends the rest of the linked documents directly to the printer. The documents are linked by page number in Word, and are part of a "book file" in FrameMaker. I called Microsoft and Frame, and they say the Apple driver must be at fault. I tried using the LaserWriter 5.2 driver and that worked, but the printing device can't print PostScript files created with that driver.

What's happening here?

DISCUSSION ----------

This is a known problem with the LaserWriter driver and is discussed in Macintosh Technical Note #312. Here is an excerpt from the technical note:

Like many Printing Manager calls, PrJobMerge is implemented by the currently chosen printer driver. This makes sense after consideration -- since the printer driver may store job-specific information anywhere in the print record, only the printer driver can correctly merge this into a destination print record.

The LaserWriter driver's implementation of PrJobMerge has a few bugs in versions 7.0 and 7.1.

Fun Thing #1

Historically, PrJobMerge hasn't worked correctly in the LaserWriter driver. The driver does not correctly merge all job-related data (like the number of copies requested) into the destination print record, so printing multiple copies of multiple documents from the Finder isn't really possible with the LaserWriter driver.

The only possible workaround is to present a different job dialog for each document to be printed, but this isn't recommended -- especially since the job dialog doesn't tell you which document you’re about to print.

Fun Thing #2

As if this wasn't enough excitement for one driver, in versions 7.0 and 7.1 of the LaserWriter driver PrJobMerge actually manages to destroy all the job-specific information in the source print record after it doesn't copy it into the destination print record.

A/UX: Change Printcap to Use Printer in Another Zone (9/94)

Revised: 9/7/94
Security: Everyone

A/UX: Change Printcap to Use Printer in Another Zone (9/94)

==========

Article Created: 25 September 1992
Article Reviewed/Updated: 6 September 1994

TOPIC ----------

Is it necessary to include the zone name with the printer name (that is, full path name) in the printcap file entry for a printer that is located in a remote zone? And, if so, what is the syntax to do this?

I want to use the lpr command to send a print job to a remote printer defined in the printcap file. I don't want to have to go through the Chooser to select the printer. As it is defined now (without the full path name), I'm getting a message saying that the printer can't be found.

DISCUSSION ----------

If the printer is in another zone, it's necessary to define the zone in which the printer is located with a full path name. You can then "hardwire" a printer name including the zone for a particular printer queue.

The best way to do this is to make a copy of the /usr/spool/lpd/AppleTalk directory and give it a name related to the printer you want to use. Modify the file ifilter/ofilter/nfilter (it's the same file with 3 hard links) in this directory. Also modify the /etc/printcap file to create a new printer queue.

We'll use our system as an example; modify it to reflect your situation.

First, create the new directory and put the correct files in it. NOTE that we're using mknod to create the pipe file.

```
mkdir Idaho
chown daemon Idaho
chgrp daemon Idaho
cp AppleTalk/ifilter Idaho/ifilter
cd Idaho
ln ifilter ofilter
```

```
  ln ofilter nfilter
  mknod pipe p
  chown daemon *
  chgrp daemon *
```

We have a printer called "Idaho Spooler" in the zone "West" while my system is on the zone "East." So all I do is modify the /usr/spool/lpd/Idaho/ifilter file (you can use vi or TextEditor) and change the line that defines the value for Printer:

```
  from

  Printer=`basename "cwd"`

  to

  Printer="Idaho Spooler:LaserWriter@West"
```

In the /etc/printcap file I copy the entry for AppleTalk (all six lines) and change any reference to AppleTalk to the name I used for my new directory. Again, in my case I used "Idaho" as the directory name so my /etc/printcap file looks like:

```
  #
  # pragma ident "@(#)lpr:printcap        5.4 90/03/27 "
  #
  # Copyright 1990 Apple Computer, Inc.
  # All Rights Reserved.
  #
  # Remote AppleTalk printer (selected by Chooser)
  # For an AppleTalk printer which doesn't support PostScript remove last 2
  names.
  lp|at|AppleTalk|postscript|PostScript:\
        :lp=/dev/null:\
        :if=/usr/spool/lpd/AppleTalk/ifilter:\
        :of=/usr/spool/lpd/AppleTalk/ofilter:\
        :nf=/usr/spool/lpd/AppleTalk/nfilter:\
        :sd=/usr/spool/lpd/AppleTalk:
  lp2|Idaho:\
        :lp=/dev/null:\
        :if=/usr/spool/lpd/Idaho/ifilter:\
        :of=/usr/spool/lpd/Idaho/ofilter:\
        :nf=/usr/spool/lpd/Idaho/nfilter:\
        :sd=/usr/spool/lpd/Idaho:
```

After all these steps are completed, restart the printer queue with the command

```
  lpc restart all
```

Now you should be able to send a print job to the printer in the other zone with the command:

```
  lpr -Plp2 /etc/passwd
```

```
  or

  lpr -PIdaho /etc/passwd
```

ARA: Turn On AppleTalk in Chooser After Installing ARA

Revised: 8/2/93
Security: Everyone

ARA: Turn On AppleTalk in Chooser After Installing ARA

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 30 July 1993

TOPIC ----------

Upon initial installation of AppleTalk Remote Access (ARA), AppleTalk is turned off in the Chooser. When new users select ARA, they get a message saying that ARA wasn't correctly installed or is corrupted and they should re-install. Repeated installation efforts give the same results. The dialog is persistent whether it's a brand new installation or an existing (and previously working ARA) setup.

The real problem is that AppleTalk is turned off, and you must turn on AppleTalk in the Chooser for ARA to work at all.

Does Apple plan to change the dialog box to instruct users to turn AppleTalk on?

DISCUSSION ----------

This problem will be fixed in the next release of AppleTalk Remote Access. The error dialog will say something about going into the Chooser and turning on AppleTalk.

Note: You can also use the Always AppleTalk software which is part of the PowerBook File Assistant collection of software. This allows a System 7.1 user to switch between AppleTalk being active and inactive without restarting the computer.

Cause of Incorrect Messages in Several Utilities

The problem is that the 7.0 Tune Up doesn't load enough of AppleTalk to let anyone know that AppleTalk is turned off. As a result, ARA and several other network utilities are unable to function, and display a false error message.

There is a way to tell whether AppleTalk can be turned on. The revised meaning of the Gestalt 'atkv' selector is that if the selector is present, it returns the "available" version of AppleTalk. If the selector isn't present, then AppleTalk isn't available.

Note that this differs from the 'atlk' selector, which returns zero if AppleTalk is currently off, and the AppleTalk version if AppleTalk is currently on. But this only tells you the current state; it doesn't tell you if AppleTalk COULD be turned on in the Chooser without restarting.

AppleTalk Remote Access calls gestalt with the 'atkv' selector to make sure that the correct AppleTalk is installed. But, there is no 'atkv' selector because Tune Up prevented the AppleTalk boot code (which installs the selector) from running. ARA then complains that your software is incorrectly installed if the selector is not present. At the time ARA was released, this was the correct behavior. Since Tune Up has come along, the rules have changed. Now the lack of an 'atkv' selector means that AppleTalk can't be turned on without restarting.

Another aspect of the problem is that when the LAP manager loads, it checks PRAM to see if AppleTalk has been configured. If these bits in PRAM have never been configured or if PRAM has been "zapped," the LAP manager would believe that AppleTalk was turned off. If PRAM is zapped, then the AppleTalk status setting may be left in an indeterminate state. There was a change, beginning with AppleTalk 57 on how the setting in PRAM is interpreted:

AppleTalk Version	<57	>=57
PRAM setting ON	ON	ON
PRAM setting indeterminate	ON	OFF
PRAM setting OFF	OFF	OFF

Therefore if you ever zapped PRAM, the AppleTalk status setting may have been left in an indeterminate state. AppleTalk Remote Access updates AppleTalk to version 57.0.1, and displays the "improperly installed" message because it determines that AppleTalk is turned off.

(PowerBook users don't know any of this. Their computers come with Tune Up pre-installed and AppleTalk off.)

Other utilities and applications will also suffer from the problem. The Network control panel, MacTCP, and DAL with Tune Up installed and AppleTalk off all suffer from the same problem and the user is presented with a similar "not installed correctly" message.

- MacTCP gives the error -43 (driver not installed).

- DAL will just not connect to any of its servers or the DAL installation checker will show no network adaptor (drivers) cards.

- The Apple Internet Router give the error message "The router software was damaged or incorrectly installed. Please re-install the router."

The Solution

AppleTalk version 57.0.4 fixes these problems for most cases.

- If PRAM is unconfigured, it no longer believes that AppleTalk is off, instead it believes it is on.

- The Network control panel now displays a more appropriate message telling users that AppleTalk is turned off instead of telling them that their software has been incorrectly installed.

- Future revisions of AppleTalk Remote Access and Apple Internet Router will have more meaningful error messages.

- In System 7.1 MacTCP, LAT, and DAL will load whether AppleTalk has been turned on or off.

Article Change History:
30 July 1993 - Revised to add note about Always AppleTalk software.
6 January 1993 - Revised to add information about the effect of zapping PRAM on AppleTalk status.

Macintosh Color Display: Compared to AppleColor RGB Monitor

==========

Article Created: 19 October 1992

TOPIC ----------

This article shows how the Macintosh Color Display differs from the AppleColor High Resolution RGB Monitor.

DISCUSSION ----------

These are the features the two monitors share:

- Trinitron CRT
- .26mm stripe pitch
- 66.7 Hz refresh rate
- 640 x 480 pixel map
- 70 dpi
- Autodegauss at start-up
- ELF/VLF magnetic field compliant

Here are the features new to the Macintosh Color Display:

- Built-in tilt/swivel base
- Power and brightness/contrast controls on the front of the display
- ELF/VLF electric field compliant
- 53 Watts average use

Macintosh Color Display: Description

==========

Article Created: 19 October 1992

TOPIC ----------

This article describes the Macintosh Color Display, and gives features, benefits, and compatibility information.

DISCUSSION ----------

The Macintosh Color Display features a flat Trinitron tube that gives maximum screen area, sharp focus, and minimum distortion. Its automatic degaussing at start-up provides distortion-free viewing and a stripe pitch of .26mm for clarity. This is Apple's brightest mid-range monitor. The electronics are designed to optimize clarity at this brightness.

The 66.7 hertz screen refresh rate gives flicker-free performance to minimize eye strain. Magnetic and electric emissions are very low, conforming to strict SWEDAC guidelines. The built-in tilt swivel allows viewing angle adjustment.

Features

- Trinitron CRT with .26 stripe pitch
- High brightness and contrast
- Color and brightness uniformity
- 640 x 480 pixels at 70 dpi
- Autodegauss at power-up
- Tilt/swivel stand built in
- 66.7 Hz refresh rate
- Low emissions

Benefits

- Trinitron technology allows more accurate focusing of the RGB electron beam for a brighter, clearer picture.
- The .26 mm stripe pitch improves focus.

- High contrast design enhances the distinction between black and white on the screen to improve focus and reduce eyestrain.
- Produces pure and uniform colors over the entire screen area.
- 35% more screen area than the 12-inch RGB monitor
- Autodegauss eliminates distortion from external magnetic fields, and guarantees consistent color purity.
- Tilt/swivel stand allows adjustment for the best viewing angle.
- 66.7 Hz refresh rate reduces flicker.
- Meets SWEDAC recommendations for ELF and VLF magnetic and electric emissions.

Compatibility

All Macintosh modular computers support the Macintosh Color Display to 256 colors. The Macintosh LC II needs the VRAM upgrade to support 256 colors. The Macintosh Quadra 700, 900, and 950 support 24 bits per pixel, for 16.7 million colors.

All Apple video cards and on-board video connections in the Macintosh II family support the Macintosh Color Display at varying bit depths.

Performa 600: Control Chips

==========

Article Created: 14 September 1992

TOPIC --------------------

This article describes the Macintosh Performa 600's control chips.

DISCUSSION --------------------

VASP

The VASP controls all timing, video generation, memory mapping, sound, and clock generation. VASP is a modification of the V8 ASIC used in the Macintosh LC and Macintosh LC II.

Ariel

Ariel is the 256x24 bit color look-up table (CLUT) for Performa 600.

CoMBo Chip (85C80)

The CoMBo chip provides identical serial and SCSI interface control for Performa 600. Performa 600 provides on-board SCSI termination when no external SCSI device is connected to the DB-25 connector.

Egret (68HC05)

The Egret chip provides keyboard scanning, real-time clock, ADB interface, parameter RAM storage, power on reset, and power supply control.

Performa 600: Expansion

==========

Article Created: 14 September 1992

TOPIC ----------

This article describes the Macintosh Performa 600's expansion possibilities.

DISCUSSION ----------

The Macintosh Performa 600 features three NuBus expansion slots and one accelerator card slot.

The power budget for each NuBus slot is 13.9 watts (same as the Macintosh IIci) for a total of 41.7 watts.

The power budget for the accelerator card slot is 5 watts (same as the Macintosh IIci cache budget). Accelerator cards must conform to a 3x6-inch form factor (identical to the Macintosh IIci cache card form factor).

There are no openings for any on the back of the Performa 600 enclosure to support external connections for this card. The accelerator connector signals are a subset of the those provided by the Macintosh IIci cache connector. Processor address, data, and some control signals are provided. Cache control signals are not provided.

Performa 600: Internal Video Support

Revised: 9/10/92
Security: Everyone

Performa 600: Internal Video Support

==========

Performa 600: Internal Video Display Support

Article Created: 14 September 1992

TOPIC -----

This article describes the Macintosh Performa 600's internal video display support.

DISCUSSION -----

The following chart lists the monitors supported by Performa 600's internal video:

MON ID 3 2 1	Monitor Selected	Cols/ Rows	Vertical Refresh	Horizontal Refresh	Bandwidth
0 0 1	reserved				
0 1 0	12" RGB	512 x 384	60.15 Hz	24.48 KHz	15.6672 MHz
1 1 0	12" B/W, 13" RGB	640 x 480	66.67 Hz	35.0 KHz	30.24 MHz
0 0 0	reserved				
0 1 1	VGA	640 x 480	59.94 Hz	31.47 kHz	25.18 MHz
1 0 0	reserved				
1 0 1	reserved				
1 1 1	no monitor connected				

* 640 x 480 displays are supported at 8 bits/pixel with 512K VRAM and 16

bits/pixel with 1 MB of VRAM

Note: The monitor ID pins 3, 2, and 1 refer to pins 10, 7, and 4 on the DB-15 external video port.

The monitor ID must be asserted in the monitor by grounding lines for zeros and leaving no connection for ones. No co nects are pulled high by pullup resistors on the Performa 600 logic board.

Standard Macintosh video timing calls for a 30.24 MHz pixel clock for 640 x 480 displays. Performa 600 deviates from the standard by using the CPU clock, at 31.3344 MHz, as a pixel clock for those displays. This results in an extra 32 pixels per horizontal line. The active pixels are center in the active video field with 16 extra pixels on each side. Horizontal and vertical scan rates remain unchanged. The effect of this change is that square pixels are visually 3% thinner. The 12" monochrome display compensates for this aberration, but the 13" color display does not. Monitor ID 2 is grounded within Performa 600, which triggers the 12" monochrome display to realize that it is connected to a Performa 600 and allows the monitor to compensate for the slightly different timing.

VGA monitors use the monitor ID of 011 which is the same as the two-page monochrome monitor. VGA monitors use the extended monitor sense codes which is enabled by tying the ID 3 and ID 2 lines together at the monitor end. The extended sense for a VGA monitor is 01 01 11.

One other anomaly in Performa 600 is that it does not support 1 bit/pixel mode on 512 x 384 monitors.

Performa 600: RAM Configurations

==========

Article Created: 14 September 1992

Article Change History

09/15/92 - UPDATED
- To include correct product name of new AppleCD 300i.

TOPIC ----------

This article outlines the Macintosh Performa 600's possible RAM configurations.

DISCUSSION ----------

Without an AppleCD 300i installed, the Macintosh Performa 600 has 4MB of DRAM soldered to the logic board.

The 5MB configuration, used with the internal AppleCD 300i, has another 1MB of DRAM installed in the four 30-pin DRAM SIMM sockets.

The sockets support up to 16MB DRAM SIMMs for a maximum DRAM configuration of 68MB. All DRAM must be at least 80 ns, fast-page mode.

Possible DRAM configurations:

- 4MB 4MB soldered to logic board, empty SIMMs
- 5MB 4MB soldered, 1MB in SIMMs (four 256K SIMMs)
- 8MB 4MB soldered, 4MB in SIMMs (four 1MB SIMMs), part #M5952LL/A
- 12MB 4MB soldered, 8MB in SIMMs (four 2MB SIMMs)

- 20MB 4MB soldered, 16MB in SIMMs (four 4MB SIMMs)
- 68MB 4MB soldered, 64MB in SIMMs (four 16MB SIMMs)

Security: Everyone

Performa 600: ROM

==========

Article Created: 14 September 1992

TOPIC --------------------

This article describes the Macintosh Performa 600's ROM and memory map.

DISCUSSION --------------------

The Macintosh Performa 600 has 1MB of ROM. ROM upgrades are possible via the ROM expansion SIMM.

Memory Map (32-bit)

DRAM —4 MB on logic board	$00000000 - $003FFFFF
Expansion DRAM (in SIMMs)	$00400000 - $043FFFFF (up to 68MB)
Unassigned DRAM space	$04400000 - $3FFFFFFF
ROM read	$40000000 - $403FFFFF
ROM flash write	$40400000 - $407FFFFF
Repeated ROM images	$40800000 - $4FFFFFFF
VIA1	$50x00000 - $50x01FFF (x = $0 - F)
SCC	$50x04000 - $50x05FFF
SCSI	$50x10000 - $50x11FFF
SCSI DMA	$50x12000 - $50x13FFF
SCSI Handshake	$50x06000 - $50x07FFF
Sound	$50x14000 - $50x15FFF
SWIM	$50x16000 - $50x17FFF
VDAC	$50x24000 - $50x25FFF

VIA2/VASP registers	$50x26000 - $50x27FFF	
CPUID	$5FFFFFFC - $5FFFFFFF	
VRAM	$60000000 - $600FFFFF	(up to 1MB)
VRAM repeated images	$60100000 - $6FFFFFFF	
NuBus space	$70000000 - $FFFFFFFF

Performa 600: Sound Capabilities

Revised: 9/10/92
Security: Everyone

Performa 600: Sound Capabilities

==========

Article Created: 14 September 1992

TOPIC -----

This article describes the Macintosh Performa 600's sound capabilities.

DISCUSSION -----

All sound processing is accomplished by the VASP gate array.

The sound system includes a built-in speaker and an external stereo headphone jack.

CD audio tracks are played in stereo, and computer-generated sounds are played in mono through both channels.

If no headphones are attached, CD audio plays through the internal speaker in mono.

System beeps and CD audio are mixed together so both can be heard through either the headphone or internal speaker.

Sound input is accomplished through a stereo mini-phone jack.

Performa 600: Specifications (7/94)

==========

Article Created: 14 September 1992
Article Reviewed/Updated: 26 July 1994

TOPIC ----------

This article provides the specifications for the Macintosh Performa 600 computer system.

DISCUSSION ----------

Processor

MC68030, 32-bit architecture, 31.3344 MHz clock frequency, integrated Paged Memory Management Unit (PMMU)

Coprocessor

Optional MC68882 floating-point unit, 31.3344 MHz clock frequency

Memory

• Comes with 4 MB of RAM (5 MB of RAM for internal CD-ROM version), expandable to 68 MB. Four SIMM slots require 80ns (or faster) fast-paged mode RAM.

• 1MB ROM

• 256 bytes of non-volatile parameter memory (PRAM)

Video RAM

512K video RAM, upgradable to 1 MB (Internal CD-ROM version comes with 1 MB of VRAM).

• 512K video RAM supports the following modes:
  – Macintosh 12" RGB Display (512 x 384 pixels) at 1, 2, 4, 8, and 16 bits

per pixel
  — Macintosh 12" Monochrome Display, AppleColor High-Resolution RGB Monitor, Macintosh Performa and Performa Plus Display and the Macintosh Color Display (640 x 480 pixels) at 1, 2, 4, and 8 bits per pixel

• 1 MB video RAM supports the following modes:
  — Macintosh 12" RGB Display (512 x 384 pixels) at 1, 2, 4, 8, and 16 bits per pixel
  — Macintosh 12" Monochrome Display (640 by 480 pixels) at 1, 2, 4 and 8 bits per pixel
  - AppleColor High-Resolution RGB Monitor, Macintosh Performa and Performa Plus Display and the Macintosh Color Display (640 x 480 pixels) at 1, 2, 4, 8 and 16 bits per pixel

Disk Drives

• Apple SuperDrive 1.4 MB high-density floppy disk drive

• Internal Apple SCSI hard disk drive (third- or half-height, 80 MB to 400 MB)

• Support for a second internal half-height 5.25-inch SCSI device, such as a AppleCD 300i CD-ROM drive or a hard disk drive

• External SCSI port supports up to six additional SCSI devices

Interfaces

• Two ADB ports support keyboard, mouse, and other daisy-chained devices via synchronous serial bus (maximum of three devices).

• Three NuBus expansion slots accommodate expansion cards with a maximum power budget of 15 watts per slot.

• One PDS (processor-direct slot) accommodates an accelerator card with a maximum power budget of 5 watts.

• Two RS-232/RS-422 serial ports, 230.4 Kbits/second maximum (up to 0.920 Mbit/sec if clocked externally).

• SCSI interface supports up to six external SCSI devices.

• Sound output port capable of delivering monophonic sound from computer generated sounds to both channels of a stereo device. Audio CD's deliver stereo sound to the port. (Audio CD's can play in mono through the built-in speaker on the Performa 600)

• Sound input port for monaural sound input

AC Line Input

• Line voltage: 100-240 volts AC, RMS automatically configured

• Frequency: 50-60 Hz single-phase

• Power: 112 watts maximum, not including monitor power

AC Line Output

• Output receptacle: 100-240 volts AC, RMS, 3 ampere maximum

DC Power

• 112 watts maximum

+5 volt	15.0 amps
+12 volt	2.5 amps
-12 volts	0.6 amps

Clock/Calendar

• CMOS custom chip with long-life lithium battery

Displays

The internal video logic supports a variety of color and monochrome monitors, including:
• Macintosh Performa Display
• Macintosh Performa Plus Display
• Macintosh Color Display
• Macintosh 12" Monochrome Display
• Macintosh 12" RGB Display
• AppleColor High-Resolution RGB Monitor
• 640 x 480 pixel VGA displays (special adapter cable required)
• Other third-party monitors

Monitors not supported by Performa 600's internal video are supported by NuBus video (or display) cards.

Input Devices

• Standard or extended Apple keyboard with ADB connector

• ADB mouse: mechanical tracking, optical shaft, or contact encoding

• Microphone: electret type, omnidirectional, power provided by the computer. Output voltage is 4 millivolts peak to peak at normal speaking volume.

Dimensions

• Weight	11.3 kg (25 lb.)
• Height	152 cm (6 in.)
• Width	330 mm (13 in.)
• Depth	419 mm (16.5 in.)

Environment

- Operating temperature: 10° C to 40° C (50° F to 104° F)
- Storage temperature: -40° C to 47° C (-40° F to 116.6° F)
- Relative humidity: 5% to 95% (noncondensing)
- Altitude: 0 to 3048 m (0 to 10,000 ft.)

Software Already Installed

- System 7 software for Performa computers, designed specifically to make the Performa easy for everyone in the family to use.
- At Ease software, which helps prevent other users from accidentally erasing your valuable files.
- Macintosh PC Exchange software so you can work with MS-DOS and Windows disks you bring home from work.
- Application software, including a program that combines word processing (for memos and letters, spreadsheet (for financial calculations), and graphics (for drawing and painting).

Article Change History:
26 Jul 1994 - Expanded information on sound out capabilities.
19 Jan 1993 - Updated to include memory configuration of internal CD ROM version.
09 Nov 1992 - Updated to further expand list of display options.
02 Nov 1992 - Updated to list of displays, and to clarify SCSI information.

Performa 600: Video RAM

Revised: 9/11/92
Security: Everyone

Performa 600: Video RAM

==========

Article Created: 14 September 1992

Article Change History

09/15/92 - UPDATED
- To include full name of AppleCD 300i.

TOPIC ----------

This article describes the Macintosh Performa 600's VRAM (video RAM).

DISCUSSION ----------

The Performa 600 uses VRAM for video and sound data storage. This internal video support is similar to that of the Macintosh LC and LC II. It is an improvement on the Macintosh IIci and IIsi scheme, which used available main DRAM for video and sound, causing delays when both the video circuitry and the CPU were accessing DRAM at the same time. The VRAM is installed into two 68-pin SIMM sockets with pinouts identical to that of VRAM sockets on the Macintosh LC and LC II, and Macintosh Quadras. Both SIMM sockets must be filled with either 256K or 512K SIMMs. The video data path is 32 bits wide.

Two 256K SIMMs (part #M5953LL/A) yield 512K of VRAM and support 640 x 480 displays at up to 8 bits/pixel (256 colors or shades of gray) or 512 x 384 displays at up to 16 bits/pixel (thousands of colors).

Two 512K SIMMs (part #M0517LL/A) yield 1MB of VRAM, which supports 640 x 480 and 512 x 384 displays at up to 16 bits/pixel. This 1MB VRAM configuration is standard on any Performa 600 configured with the optional AppleCD 300i.

Performa 600: Optional AppleCD 300i

==========

Article Created: 14 September 1992

Article Change History

09/15/92 - UPDATED AND RETITLED
• To include correct name of AppleCD 300i.

TOPIC ---

This article describes the AppleCD 300i CD-ROM drive available as an option with the Macintosh Performa 600 computer.

DISCUSSION ---

Key features of the Macintosh Performa 600's optional AppleCD 300i:

• Faster data access than the AppleCD 150.

• Support for Kodak's Photo CD technology. A new version of CD Remote, and a Photo CD file system translator that understands the Photo CD format, are included.

Speed

This drive rotates a disc at twice the normal speed, resulting in faster data access and more immediacy in interactive applications. This drive can operate at both normal speed and double speed, so any application (such as CD audio) that relies on the normal spin rate is not affected.

Transfer Rates	Normal Mode 1	150 kbytes/sec.
	Normal Mode 2	171.1 kbytes/sec.
	Double Mode 1	300 kbytes/sec.
	Double Mode 2	342.2 kbytes/sec.

At Ease: Cannot Disable Application's Functions (8/95)

==========

Article Created: 14 September 1992
Article Reviewed/Updated: 04 August 1995

TOPIC -----

When they launch Microsoft Works from At Ease, students have access to the Delete command from the File menu, which can be used to delete almost anything from the hard disk.

Can I can disable the Delete command?

DISCUSSION -----

At Ease, a front-end on the Macintosh Operating System, does not disable application functions.

Apple cannot suggest nor endorse any workarounds involving third-party software. Try contacting the vendor to see if they can provide any supported solutions.

Macintosh: Effect of Locking Extensions and Drivers

Revised: 9/23/92
Security: Everyone

Macintosh: Effect of Locking Extensions and Drivers

==========

Article Created: 16 September 1992

TOPIC ----------

This article answers some questions about the effects of locking various files.

DISCUSSION ----------

Q) Control panels and extensions are lockable. Other than not allowing the file to be thrown away, I'm under the impression that locking self-modifying files will prevent modification.

A) While it's true that you can lock control panels and extensions with ResEdit or similar utilities, this isn't a good idea. Some control panels and extensions expect to have write access to themselves, and may not behave gracefully when locked. We recommend AGAINST locking any file in the System Folder that doesn't come locked.

Q) Are the PostScript LaserWriter drivers and AppleShare extension self-modifying?

A) The PostScript LaserWriter drivers are self-modifying, but the AppleShare extension isn't. The AppleShare extension has its own Preference file, kept in the Preferences folder, called "AppleShare Prep."

Q) I assume that in AppleShare, locking would prevent the extension from remembering any servers that were selected to auto-mount.

A) Locking the "AppleShare Prep" file will indeed prevent the extension from remembering any servers that were selected to auto-mount. Actually, you'll get one or two error messages, depending on whether you saved just your name or your name and password in the Chooser.

Q) Wouldn't locking the LaserWriter driver prevent it from selecting a different printer?

A) Yes, but it also prevents the LaserWriter driver from working. To use the LaserWriter driver, it must remain unlocked. If it's locked, you'll get an error message stating the driver was unable to locate the selected printer.

Macintosh Quadra 900 & 950: About This Macintosh Peculiarity

Revised: 9/17/92
Security: Everyone

Macintosh Quadra 900 & 950: "About This Macintosh" Peculiarity

==========

Article Created: 15 September 1992

TOPIC ----------

I recently upgrade my Macintosh Quadra 900 to a Macintosh Quadra 950. When I checked the "About This Macintosh ..." in the Apple menu, it showed only "Macintosh Quadra" instead of the expected "Macintosh Quadra 950".

DISCUSSION ----------

This is a function of the system software version 7.0.1 Installer. To have the "About This Macintosh ..." window display the 950 model number on a Macintosh Quadra 900 that was upgraded to a Macintosh Quadra 950, you need to reinstall the system software using the Installer.

Note

There is no impact to the user in terms of functionality when the 950 model number is omitted.

Non-PostScript Printers: Problems Printing Shadowed Text

Revised: 10/2/92
Security: Everyone

Non-PostScript Printers: Problems Printing Shadowed Text

==========

Article Created 23 September 1992

TOPIC --------------------

I have a PowerBook 170 and a StyleWriter. I try to print Helvetica, Times, and Geneva in size 48. When choosing shadowed style, I get the same printout as if I chose outlined style.

DISCUSSION --------------------

The problem involves the print driver translation of a 72 dpi screen image to 360 dpi printed output. On the screen, shadowed text is offset by one pixel, or 1/72 of an inch. The StyleWriter print driver also offsets shadowed text by one pixel, but one pixel is only 1/360 of an inch. If you look closely enough at the output you can discern the difference.

This problem affects all non-PostScript devices. Shadowed text on ImageWriter II printers at 72 dpi appear fine. With LaserWriter LS printers at 300 dpi, the problem is a little more pronounced. With StyleWriter printers at 360 dpi the problem is most pronounced.

Unfortunately, there is no workaround.

Kodak Photo CD

Revised: 9/17/92
Security: Everyone

Kodak Photo CD

==========

Article Created: September 14, 1992

TOPIC ----------

This article provides an overview of Kodak Photo CD technology.

DISCUSSION ----------

Kodak Photo CD is a technology for transferring 35mm film images to CD-ROM discs, making the images fully accessible to computer graphics applications. A Photo CD foreign file translator and a revised CD Remote application are included with each Performa equipped with an AppleCD 300i.

Note: QuickTime and Photo CD are required. The QuickTime and Photo CD extensions must be placed in the System Folder in order to view the images on a Photo CD. Because QuickTime has Photo CD support, any application that can open a PICT file can open a Photo CD file.

The AppleCD 150 and AppleCD SC Plus drives also support Photo CD, but what sets AppleCD 300i apart is its ability to read multiple sessions of Photo CD images. A reference used for some of the information that follows is "Photo CD: A Planning Guide for Developers" (August 1991 revision).

The Kodak Photo CD planning guide lists the following as benefits of Photo CD technology:

- Rapid retrieval and display of images.
- High-quality continuous-tone printing. Near optical-quality hard copy is possible with the equivalent of 2000-line resolution digital images.
- Consistent and optimum image quality.
- Support for a wide range of colors. The original scan from film records 36 bits per pixel of color information.

- Support for current and future television formats. Five resolutions of each image are stored, with the base resolution excellent for today's televisions. The 4x base resolution is ideal for high-definition television.

- Image duplication without degradation. With digital images, the copy is identical to the original.

- Powerful image manipulation. Powerful applications such as Adobe Photoshop are able to seemlessly work with Photo CD images.

A Photo CD session consists of all of the images contained on one roll of film (whether it is 12, 24, or 36 exposures). Until now, CD drives were able to read only one session. Kodak recently introduced equipment with the ability to encode several sessions of images onto one disk, and new CD drives (including the Apple CD 300) are being introduced that can read those sessions. A single Photo CD can now hold up to 100 images. The projected cost for developing a 24-exposure roll of 35mm film and pressing the Photo CD is about $24. The customer receives a Photo CD, the image negatives, and if desired, prints or slides of the images (the prints or slides will cost an additional $4 to $5). With the next set of pictures, the user would take in both an undeveloped roll of film and the once-used Photo CD. The CD would then be encoded with the new images and returned.

Film to CD

A high-speed scanner converts the images on the roll of film to digital data of 2048 lines of 3072 pixels with a depth of 12 bits per each primary color (a total of 36 bits per pixel). Each image is represented by 18MB of information. Next, a Sun SPARCstation is used to adjust the digital file for color and density and compress it (with no loss of image information) to an average of about 4.5MB.

Each image is represented in five different resolutions. The base resolution is 512 x 768 pixels, sufficient to display the image on a television or computer monitor. The 4base and 16base images are created by successive interpolation and correction schemes between pixels. The 4x and 16x representations are useful for displaying the images on high-definition television systems or printing on high-quality devices at thousands of lines per inch. The lower resolutions are useful because they can be quickly retrieved (less data to move around) and displayed as thumbnail representations of the images, indexes, and icons.

The five resolutions stored for each image and some uses for each are:

- Base/16 — 128 lines of 192 pixels image thumbnails, icons

- Base/4 — 256 lines of 384 pixels display of multiple images or slide shows

- Base — 512 lines of 768 pixels normal display media

- 4Base 1024 lines of 1536 pixels high quality display

- 16Base 2048 lines of 3072 pixels high quality hard copy output

The 4Base and 16Base resolutions are stored as residuals which record the differences between the pixels at the next lower resolution. Huffman encoding is also used to further compress the 4Base and 16Base resolutions of each image. The complete data for an image is stored in something called an "Image Pac". The information is stored on a CD-ROM using the CD-ROM XA Mode 2 form 1 sector format. This standard is call the Orange Book and was developed by Sony and Philips. Refer to the Sony/Philips specification called Recordable Compact Disc Systems "Orange Book" for details on the standard.

What's On a Photo CD?

When the gold-colored Photo CD comes back from the photofinisher, the user can place it in the AppleCD 300i and the system will mount the disc just like a hard disk or floppy disk volume. The Photo CD volume will have the name "PCDnnnn", where PCD stands for Photo CD and the four numbers identify the photofinisher. The name cannot be changed. If the user double-clicks the Photo CD icon, the system opens up the volume and displays photos folders, a Kodak folder, a "Slideshow" file, the Slideshow Viewer application, and a Photo CD folder.

Each resolution folder contains a file for every image on the disc at that specific resolution (such as 768 by 512). The Photo CD folder contains technical information about each of the images. The Slideshow file and Slideshow Viewer application allow the user to browse the images as a slide show.

If the user opens one of the resolution folders, a numbered icon for each image on the CD is displayed. Each icon is a thumbnail image of the image contained within the file.

If the user double-clicks on the icon, the system presents a dialog box asking if the user wishes to view the image in TeachText. TeachText displays the image (if enough memory is available) and allows the user to copy and paste the image into the Clipboard, Scrapbook, or any other document.

The Photo CD Viewer application displays one image at a time with window controls that allow users to automatically play each image, scroll to a specific image, or incrementally scroll through the images.

Photo CD Technology

A Photo CD image is a rectangular array of square pixels in a 3:2 aspect ratio that matches ratio of 35mm film. Pixels represent colors encoded with Kodak's PhotoYCC color-encoding scheme. Each pixel is separated into an 8-bit luma (brightness) component and two 8-bit chroma (color)

components. PhotoYCC encoding was chosen because it provides the proper dynamic range (ratio between the minimum and maximum intensities attainable) and color gamut needed for high-quality color printing. PhotoYCC encoding can be easily converted into RGB information. PhotoYCC encoding also allows for a very efficient data compression schemes. To facilitate efficient video display, Kodak based the PhotoYCC scheme on video standards. PhotoYCC is based on aspects of CCIR Recommendation 601-1 and the international recommendation for high-definition television production, CCIR 709.

Conversion from the 36 bit per pixel RGB scan to PhotoYCC is accomplished in three steps. First, a nonlinear transformation is applied to the image signals. Next, the transformed values are converted to one luma and two chroma components. Finally, the three components are converted to 8-bits per component data.

Note: Although the Photo CD Image Pac format contains definitions for larger-format film, initially only 35mm film will be supported.

Apple Software

A Photo CD file system translator, and a new version of CD Remote, understand the Photo CD format.

AppleCD 300i: Specifications

Revised: 11/24/92
Security: Everyone

AppleCD 300i: Specifications

==========

Article Created: 14 September 1992

TOPIC ----------

This article provides the specifications for the AppleCD 300i internal CD-ROM drive, available as an option on the Macintosh Performa 600 computer.

DISCUSSION ----------

Disc

- Data surfaces 1
- Disc diameter 12 cm
- Disc center hole 15 mm
- Thickness 1.2 mm
- Track pitch 1.6 microns (15,875 tracks per inch)
- Scanning velocity 1.2 - 1.4 meters per second
- Rotation speed varies over radius
  Normal speed ~530 to 230 rpm
  Double speed ~1060 to 460 rpm
- Latency (average) varies over radius
  Normal speed ~55 to 130 milliseconds
  Double speed ~27.5 to 65 milliseconds
- Blocks per rotation ~8.4 to 19.5 variable
- Average access time

Normal speed	350 milliseconds
Double speed	295 milliseconds

Data

• Data capacity	656MB (mode 1) 748MB (mode 2)
• Blocks per disc	270,000 (typical)
• Data per block	2048 bytes (mode 1) 2336 bytes (mode 2)
• Address description	minutes, seconds, frames

Audio Capacity

• Playing time	74 minutes and 42 seconds

Data Streaming and Transfer Rates

• Blocks per second	75
• User bytes per second	150KB (mode 1) 171.1KB (mode 2)
• SCSI bus transfer rate	1.5MB per second

Modes Supported

- CD-Audio
- CD-ROM, modes 1 and 2
- CD-ROM XA mode 2 form 1
  mode 2 form 2

Noise

• Drive on (seek)	<50 dB
Drive on (non-seek)	<46 dB

Environment

• Operating temperature	+5° C to 40° C (+41° F to +104° F)
• Storage (6 months)	-30° C to 50° C (-22° F to +122° F)

• Transit (72 hours)	-40° C to +65° C (-40° F to +149° F)
• Operating Humidity	10% to 90% noncondensing
• Storage Humidity	5% to 95% noncondensing

Power Requirements

• AC input (Universal)	100 to 240 V AC, 50 to 60 Hz

Power Consumption

• Drive on	0.28 A

Interface

• SCSI	Two 50-pin connectors

PhotoYCC Conversion Formulas

From "Kodak Photo CD System: A Planning Guide for Developers" (August 1991).

Nonlinear Transformation

The nonlinear transformation corresponds to the opto-electronic transfer characteristic defined in CCIR 709. The following mathematical equations express the nonlinear transformation of scanned image color data:

For R, G, B ≥ 0.018:

R‘ = 1.099 R (superscript 0.45) - 0.099
G‘ = 1.099 G (superscript 0.45) - 0.099
B‘ = 1.099 B (superscript 0.45) - 0.099

For R, G, B ≤ 0.018:

R‘ = -1.099 |R| (superscript 0.45) + 0.099
G‘ = -1.099 |G| (superscript 0.45) + 0.099
B‘ = -1.099 |B| (superscript 0.45) + 0.099

For -0.018 < R, G, B < 0.018:

R‘ = 4.5R
G‘ = 4.5G
B‘ = 4.5B

Conversion To Luma/Chroma Components

The luma and chroma encoding equations correspond to CCIR Recommendation

601-1. The following equations define the conversion from RGB data to luma and chroma data:

Luma = 0.299R‘ + 0.587G‘ + 0.114B‘
Chroma1 = -0.299R‘ - 0.587G‘ +0.886B‘
Chroma2 = 0.701R‘ - 0.587G‘ - 0.114B‘

Conversion To 8-bit Data

Conversion of the luma and chroma values is accomplished by the following equation:

Luma (8-bit) = (255/1.402) Luma
Chroma1 (8-bit) = 111.40 (Chroma1) + 156
Chroma2 (8-bit) = 135.64 (Chroma2) + 137

Kodak Photo CD: Q & A

Revised: 9/17/92
Security: Everyone

Kodak Photo CD: Q & A

==========

Article Created: September 14, 1992

TOPIC ----------

This article answers some common questions about Kodak Photo CD technology.

DISCUSSION ----------

Q. Does the AppleCD 300i support Kodak's Photo CD?

A. Yes, AppleCD 300i supports multiple sessions of Photo CD images and can hold up to 100 images of 35mm pictures.

Q. Can I open the image files with my paint program?

A. Yes. Because Photo CD support has been added to QuickTime, any application that can read a PICT file can open a Photo CD image file. Images can be altered and stored on other media, or printed.

Q. What is the data format for the image files on a Photo CD?

A. Kodak has created a special PhotoYCC data format for the image files which provides more thorough color information and lends itself to very efficient data compression scheme. PhotoYCC files can be translated to RGB information easily.

Q. Can I see my prints and decide which ones I want on my Photo CD?

A. Initially, Kodak is supporting only the transfer of entire rolls of film to CD. As the technology becomes more of a standard, users will have more flexibility.

Q. What film sizes are supported?

A. The potential for film sizes other than 35mm is built in to the Photo CD standard but will not be implemented until later.

SNA•ps: Configuring for Fewer than 5 LUs with Coax

Revised: 10/2/92
Security: Everyone

SNA•ps: Configuring for Fewer than 5 LUs with Coax

==========

Article Created 23 September 1992

TOPIC ----------

How do I configure SNA•ps 1.1 3270 for use on a coax line that has fewer than five LUs defined (for instance, two display LUs and one printer LU)?

DISCUSSION ----------

You need to create a configuration file so that the gateway "knows" how to set itself up to correctly present the LUs to the AppleTalk-based clients. Here's how:

1) If you're using SNA•ps 3270 (standalone), follow these steps:

   a) Run the SNA•ps Manager program.
   b) Select NEW CONFIGURATION and COAX, and the program will tell you that you have 5 Display LUs and 0 (zero) Printer LUs.
   c) Continue with step 3.

2) If you're using SNA•ps 3270 Gateway (8/32/64), follow these steps:

   a) Run the SNA•ps CONFIG program.
   b) Select NEW CONFIGURATION and COAX, and the program will tell you that you have 5 Display LUs and 0 (zero) Printer LUs.
   c) Continue with step 3.

3) Type into the DISPLAY LU box the MAXIMUM number of display LUs currently defined for this coax line (in this case, type 2). Please notice that the number of available printer LUs automatically goes to 3 (2 + 3 = 5).

   You'll notice that no matter what number you type into this box, it will always force the complementary LU setting to balance to a total of 5 LUs. It does this even though it isn't an accurate reflection of the display and printer LUs actually defined on the coax line (3 in

this case).

If you configure the coax line for one printer LU, the program forces the number of display LUs to 4. But if you actually have 2 display LUs and one printer LU defined on that line, the SNA•ps 3270 terminal emulation program tells you that there are 3 display LUs. If you try to connect to the "third" LU, you don't get a connection to an "expected" display LU complete with host splash screen. If you now run the SNA•ps 3287 printer emulation software, it can't find the printer LU.

By configuring the gateway for 2 display LUs (thereby forcing the printer LUs to 3), SNA•ps 3270 will find the 2 display LUs and the SNA•ps 3287 program will find the single defined printer LU.

AppleTalk: Effects of Redundancy on Some Network Configurations

Revised: 11/11/92
Security: Everyone

AppleTalk: Effects of Redundancy on Some Network Configurations

==========

Article Created: 29 September 1992

TOPIC -----

We have a cisco router which provides redundant paths to several AppleTalk networks. The internet routers now flip-flop between the two AGSs as their next router. Is what we're doing a legal network configuration? If it is, what causes the internet routers to swap between what they see as their next router?

Given our number of AT devices, number of physical networks, and zones (312), we're extremely sensitive to traffic issues. I would like to know more about increased traffic due to redundancy and how split horizon may help.

Also, from a desktop view, once a process is initiated from a Macintosh computer to some service on a remote network, do all packets follow the same path until the connection is broken? In other words, if I connect to a server on a remote network, and the packet can be forwarded by either CISCO 3 or CISCO 6, will all packets be forwarded through the same CISCO for the duration of the process? Is there a difference if the connection is to a server versus a printer or a Macintosh, and so on?

DISCUSSION -----

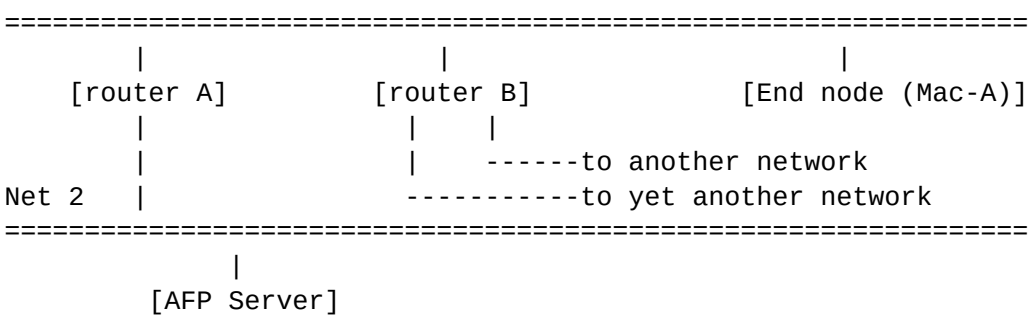
Configuration

The network configuration you've created is perfectly legal and the behavior you see is correct. RTMP assumes the latest route to a specific network is the most recent information, and replaces the information currently in the routing table, even if the route "cost" (hop count) is equal.

DDP "Best Router" Functionality

"Best route" reduces the number of needless routers used when a DDP session

is in use. Its primary purpose is to eliminate the following situation:



Here's the order of events:

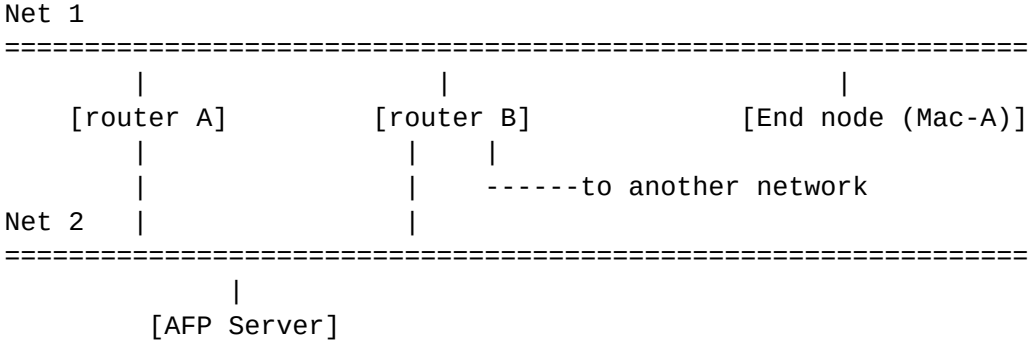
1) When end node (Mac-A) on network 1 initiates a connection to the AFP server on network 2, the initial packet might be sent to router B. This is because end nodes don't really keep any routing information. They rely on the routers to keep up with the routing tables, and as such they just sit and listen for the last RTMP packet broadcast on their cable.

2) The end nodes then use the address of that router for all routing functions. If router B was the last router that the end node saw broadcasting an RTMP packet, then the initial NBP lookUp for the AFP server is sent to router B, even though router A is the best choice.

3) Eventually, the packet gets to the AFP server, and the AFP server responds directly to the end node through router A, leaving router B completely out of the picture.

4) The end node then caches the address of the router that sent the packet, and all subsequent traffic to the server for this communications process uses router A. That's the basic reason for the DDP "best route" mechanism.

Now let's redraw the picture making router B a redundant link between network 1 and network 2.



In this case, either router A or router B would work as the "best route" to network 2. In detail:

1) The end node (Mac-A) sends an NBP lookUp for the AFP server on network 2

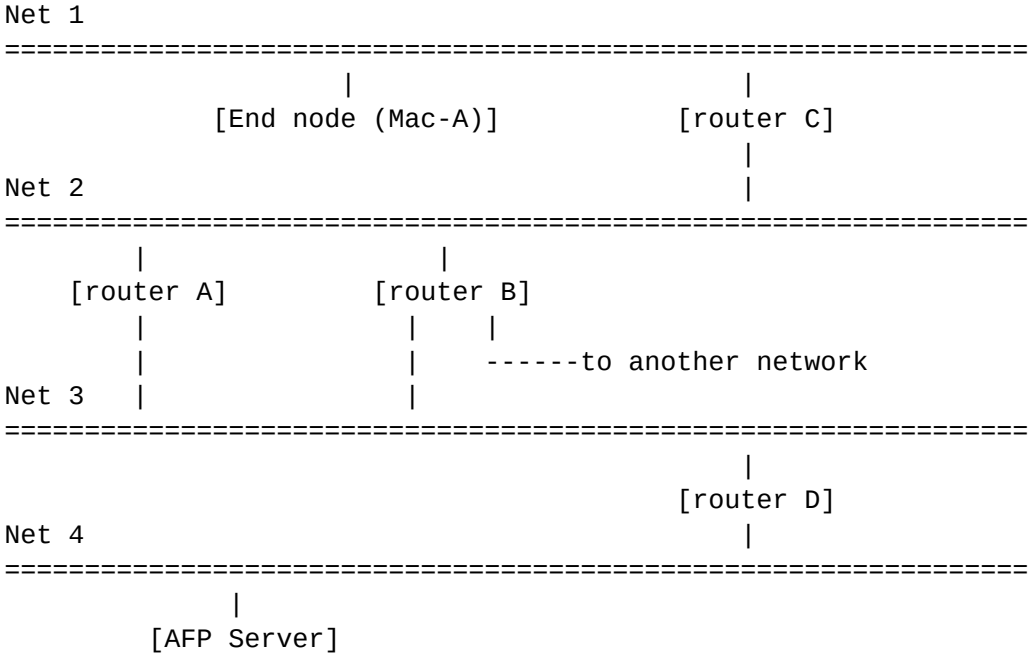
to either router A or router B, whichever broadcast its routing table last.

2) Either of the routers are capable of delivering the packet to network 2, but let's say router B was chosen. Router B passes the NBP packet on to network 2 where the AFP server picks it up and responds directly to the end node.

3) If the AFP server last saw an RTMP packet from router A, then router A would be the choice to get the packet to network 1. Since router A has connectivity to network 1, it passes it along and the end node (Mac-A) picks it up.

4) When the end node picks it up, it sees that the last router that was used was router A, and it then caches router A as the "best route" for the connection to the AFP server. The AFP server could just have easily last heard from router B, which would cause router B to be chosen as the "best route".

In a 3rd scenario, let's separate the redundant path by yet another router.



This actually looks more like what you've installed. In this scenario, DDP "best route" does nothing to allow better use of the redundant path. Let's look at the example:

1) If the end node (Mac-A) wants to talk to the AFP server on network 4, it performs an NBP lookUp.

2) The lookUp is sent to router C, and router C uses either router A or router B to deliver the packet to router D and network 4.

3) Router C uses the router that has a valid path and was the last one

heard from on network 2, either A or B. This is because the RTMP tables on router C are constantly changing state for the entry to network 4, and since both are offering the same cost, the newest entry is used.

4) The packet eventually gets to network 4, and the AFP server responds to the end node.

5) The end node will cache router C as the "best route" because it was the last router to touch the packet.

Nothing in the DDP "best route" caching mechanism does anything to load balance the link or to use one router over the other.

Increased NBP and RTMP Traffic and RTMP Packet Size

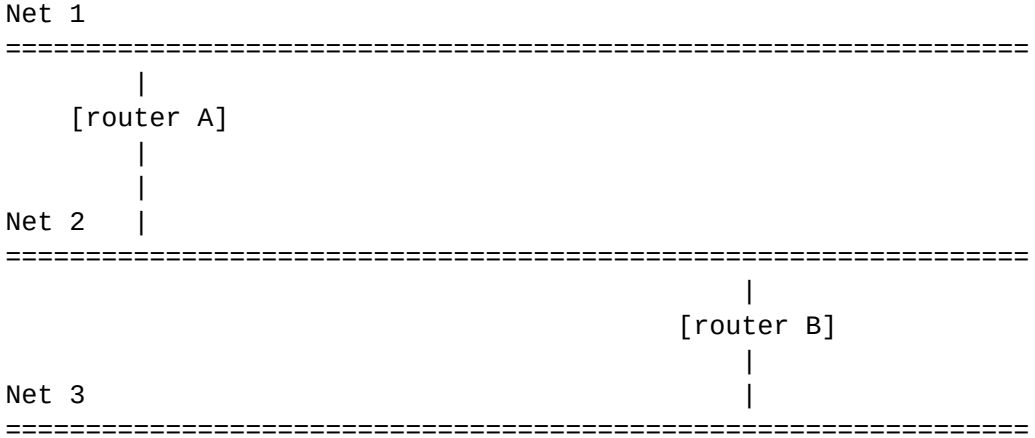
Increased NBP and RTMP traffic and large RTMP packets usually don't cause problems unless your network is already heavily loaded.

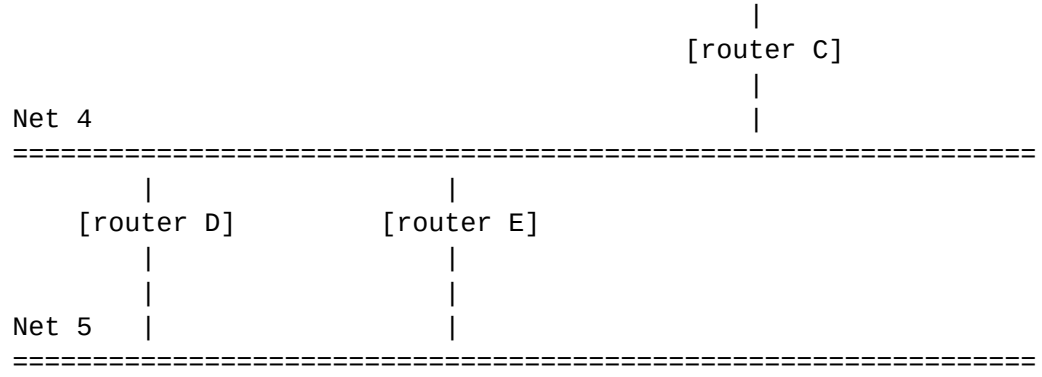
Increased NBP traffic can be attributed to additional devices on the cable. When anyone does an NBP lookUp for those particular types of devices, you'll have increased NBP traffic.

Your RTMP tables will be the same size; there are no additional routes to advertise, so the size of the table won't increase. Please note that on the cables where redundant routers are connected, the number of RTMP packets will double as both routers will be sending RTMP packets. In an internet where redundant routers are present, the split horizon mechanism does nothing to reduce the size of the RTMP tables over the size reduction already realized.

Problem with Redundant AppleTalk Routers

There is at least one small problem with redundant AppleTalk routers, and there may be others. Large enterprise networks have routes that sometimes flap. A route that flaps is stable (marked as good), then unstable (marked as suspect), then stable, then unstable (you get the idea). This is a common occurrence in large AppleTalk environments. You should ultimately find the cause of the flapping route and fix it, but sometimes it's caused by nothing more than a router that was momentarily overloaded.





Here's what happens in a situation with redundant routers. Let's say router A gets overloaded and isn't able to get its RTMP packets broadcast as often as needed to sustain the valid routes throughout the internet. Router B is the first router to discover this, and marks the route as bad. Router B then tells router C, and router C then tells router D and router E.

Router D gets the message that the route is bad. Router E does the same thing, but at the same time router E was in the process of sending out an RTMP packet to network 5. This RTMP packet says that router E has a valid route to network 1, and updates its tables accordingly. Router D then advertises that on network number 4, and the message is propagated through the network. This problem will only manifest itself for about 60 seconds, since router E will eventually time out the entry and cause the whole chain to break down. But it does create a "black hole" for 60 seconds and can cause problems for end users in the intervening time. If you have a rock solid network, you'll never see this problem. It's common for large AppleTalk networks to occasionally suffer from flapping routes. You can even see this type of anomaly under normal conditions when a router is taken down for maintenance purposes.

This may seem to be a trivial problem, but it caused our network here at Apple considerable grief when we experienced this phenomenon. After going through this experience, we hesitate to recommend redundant routers in a large AppleTalk network. Redundant AppleTalk routers are less useful than redundant links for protocols such as TCP/IP that have routing protocols to deal with redundancy. They are perfectly legal, but may not be very useful.

Conclusion

Redundant routers may be an excellent way to provide reliable service to critical parts of the network, and may work great if your network is rock solid, but as it stands today we recommend that you leave one of them turned off until it's actually needed.

AppleTalk: Hop Count Limit

Revised: 10/9/92
Security: Everyone

AppleTalk: Hop Count Limit

==========

Article Created: 30 September 1992

TOPIC -----

What is the maximum number of hops (that is, number of routers) a packet will go through before it is stopped, assuming all existing routers are AppleTalk Phase 2 routers?

DISCUSSION -----

The hop count limit, which is 15, is the same for AppleTalk Phase 1 and AppleTalk Phase 2. This is documented on page 4-17 of "Inside AppleTalk, Second Edition."

MacTCP 1.1.1: 7K Hosts File Limitation Removed

==========

Article Created: 1 October 1992

TOPIC -----

I'm having problems with the size of the hosts file; only the first 20 to 30 nodes are visible to choose from in the MacTCP tool. Would MacTCP 1.1.1 help me?

DISCUSSION -----

Yes, the limitation of a 7K Hosts file in MacTCP has been removed in MacTCP 1.1.1.

AppleShare: Troubleshooting Unexpected Change in Default Zone

Revised: 11/11/92
Security: Everyone

AppleShare: Troubleshooting Unexpected Change in Default Zone

==========

Article Created: 1 October 1992

TOPIC ----------

An AppleShare 2.0.1 server running on a Macintosh IIfx using a Shiva EtherPort II card in Phase 2 repeatedly loses its default zone and ends up in Ether2. This happens about once every night. In the morning the users find the server in Ether2. What could be causing this? We checked associated routers on the same segment of Ethernet.

DISCUSSION ----------

The default zone is stored in PRAM, which, if the battery is functional, should store the selected zone without a problem. If the lithium battery isn't fully functional, then the values in Parameter RAM can get corrupted, and you can see the symptoms you describe.

If PRAM isn't getting refreshed, you're likely to have problems with the clock, double-click setting, sound volume, and so on.

If you aren't experiencing any other difficulties with this Macintosh, it could be that the locations that store the zone data could be bad, and this would cause a specific failure. The best plan of action would be to replace the Macintosh IIfx logic board, and see how things progress from there.

MacTCP: Problems Connecting Over Token Ring Card to RS6000

Revised: 11/4/92
Security: Everyone

MacTCP: Problems Connecting Over Token Ring Card to RS6000

==========

Article Created: 1 October 1992

TOPIC ----------

I'm having trouble establishing a TCP/IP session with an RS6000 using a 4/16MB Token Ring Card and MacTCP. The Token Ring card is working (green light on) after startup. I can ping the Macintosh from the RS6000, but can't ping from the Macintosh.

Configuration:

- Macintosh IIcx
- Token Ring card in slot 2
- MacTCP
- Token Ring extension
- System 7.0 and the tune up disk

I've cleaned from the system, all INITS and extensions that aren't essential. I'm using TelNet v2.5 going over the Token Ring card to the RS/6000. I've used the ping utility from the RS/6000 (IBM) to check the connection, and it seems fine. Before the Macintosh was on this connection, an IBM was at this connection on the ring. I've tried other connections to the network, but the same thing happens.

DISCUSSION ----------

This is a known IBM RS6000 AIX bug. IBM has patches available to fix the problem. We've included some information below about each of these patches. You should contact IBM to obtain the patches.

Two IBM patches:

- if_tr patch
  This is a modified token ring driver. This is an official fix, but it won't be included in AIX 3.2. It will be available as an update. AIX v3.2 is coming out in February 1992.

- netinet patch
  Many customers have already discovered some bugs. This patch fixes many bugs, including the one you describe. This patch is already included in the AIX v3.2. So if an RS6000 is running AIX v3.2, you don't have to (or should not) install this patch.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

HyperCard 2.1 Player (9/94)

Revised: 9/20/94
Security: Everyone

HyperCard 2.1 Player (9/94)

==========

Article Created: 1 October 1992
Article Reviewed/Updated: 20 September 1994

TOPIC ----------

In September 1992, Apple began bundling HyperCard 2.1 Player with Macintosh systems sold in the United States. HyperCard 2.1 Player was either on a floppy disk or installed on the hard disk.

In December 1993, Apple took ownership of HyperCard and began sales of HyperCard 2.2. HyperCard 2.2 has the ability to create standalone applications.

DISCUSSION ----------

HyperCard 2.1 Player is a run-time version of HyperCard. It consists of:

- the HyperCard run-time engine
- a Home stack
- a Read Me file

(No sample stacks are included.)

HyperCard 2.2, running on a Macintosh with System 7, can be used to create a standalone application from any HyperCard stack. Standalone applications work on their own: others can use your stacks even if they don't own HyperCard.

HyperCard is available from Apple Software Resellers, Apple Resellers and from APDA.

Owners of HyperCard 2.1 and 2.2 have access to toll-free telephone support by calling Apple Assurance at (800) SOS-APPL. Advanced scripting support is available for a fee by calling (800) 950-2442.

Article Change History:
20 Sep 1994 - Added information about HyperCard 2.2.

Apple Font Pack

Revised: 10/1/92
Security: Everyone

Apple Font Pack

==========

Article Created: October 1, 1992

TOPIC ----------

The Apple Font Pack, a retail software product, includes a selection of TrueType fonts from leading type vendors. The Apple Font Pack addresses the typographic needs of mainstream customers. It requires minimal system overhead, and makes fonts easy to use with one-click installation and a booklet to educate customers on how to effectively use type to create compelling documents. It is available through authorized resellers.

DISCUSSION ----------

Contents

The Apple Font Pack contains:

- 25 new Apple fonts, all from leading type foundries. These are listed below.
- 18 of the fonts Apple has been shipping with the LaserWriter and StyleWriter printers.
- The Apple LaserWriter Driver and LaserWriter Font Utility software for using the fonts with Apple and third-party PostScript laser printers.

The Apple Font Pack, added to the 21 fonts that come with System 7, brings Apple's font offering for the Macintosh computer to 64.

Enhanced LaserWriter Printers

The 25 new fonts will also be added to the library of fonts included with Apple's network printers: the LaserWriter IIf, LaserWriter IIg, and Personal LaserWriter NTR. This boosts the font offering to 64 for

customers using any Macintosh computer with these printers.

Compatibility and Configurations

The Apple Font Pack requires a Macintosh personal computer running System 7. The LaserWriter IIf, LaserWriter IIg, and Personal LaserWriter NTR printer font sets are compatible with Macintosh computers running System 6.0.7 or System 7. Once installed, the fonts are compatible with any Macintosh printer or output device, and with third-party printers.

System Software: Network Install Not Supported Before System 7

Revised: 11/11/92
Security: Everyone

System Software: Network Install Not Supported Before System 7

==========

Article Created: 9 October 1992

TOPIC ----------

I'm having difficulty with installing system software on a large AppleTalk network. I'm using Installer 3.2 and trying to install System 6.0.8.

I've never been able to install System 6.0.8 using the network installation feature of the Installer. The System 6.0.7 network installation worked sporadically. When an installation failed, the error message was always "The Installer can not find the resources necessary for this installation. Please contact your network administrator." or something like that. I've checked access privileges and pathnames, and everything is correct.

DISCUSSION ----------

System Software network installation is supported beginning with System 7.0. You're trying to use the Installer (v3.2) from System 7.0 with an installer script from System 6.0.8, which doesn't support network installs. Technically, it might be possible to create an appropriate script, but it's neither supported nor recommended.

Ethernet NB Card: LW Bridge 1.0 Is Not Compatible (6/95)

Revised: 6/2/95
Security: Everyone

Ethernet NB Card: LW Bridge 1.0 Is Not Compatible (6/95)

==========

Article Created: 1 December 1992
Article Reviewed/Updated: 2 June 1995

TOPIC ----------

Is the LaserWriter Bridge 1.0 Utility compatible with the Apple Ethernet NB Card?

DISCUSSION ----------

No. We called Sonic Systems Technical Support. They told us their LaserWriter Bridge 1.0 Utility software product does not work with the Apple Ethernet NB Card (M0417LL/A). They said the LaserWriter Bridge 1.0 Utility does work properly with the old Apple EtherTalk NB Card (M0410LL/A).

They also said they have no plans to upgrade their product to work with the Apple Ethernet NB Card (M0417LL/A). For more information, please contact Sonic Systems, Inc. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

The LaserWriter Bridge 2.0 is compatible, and you can obtain it free. It is included on the Network Software Installer (NSI) 1.5 disk.

The LocalTalk Bridge is also fully compatible, and is sold as a separate product (M3246Z/A).

These articles can help you locate the NSI 1.5 software mentioned here:

• "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.

• "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Part numbers mentioned in this article are accurate as of this writing. Before

ordering, verify that they are still correct as they are subject to change.

Article Change History:
02 Jun 1995 - Added LaserWriter Bridge 2.0 and LocalTalk Bridge.
17 Oct 1994 - Changed LaserBridge to LaserWriter Bridge Utility.

System 7: Limits on Application Memory Allocation

Revised: 11/2/92
Security: Everyone

System 7: Limits on Application Memory Allocation

==========

Article Created: 19 October 1992

TOPIC ----------

I would like to increase the maximum memory for an application to more than 99MB via "Get Info" under System 7. Apparently the maximum memory currently is 99MB.

How can I increase the maximum memory to more than 99MB for an application?

DISCUSSION ----------

The current or "preferred" memory size assigned to an application (via Get Info) is limited to:

System 7 or 7.0.1	System 7.1
less than 100,000K	1,000,000K

We recommend that you upgrade to System 7.1.

DAL: AS/400 Server Q & A

Revised: 2/18/93
Security: Everyone

DAL: AS/400 Server Q & A

==========

Article Created: October 6, 1992

Article Change History

02/18/93 - REVIEW
- For technical accuracy.

TOPIC ----------

On September 1, 1992, Apple announced a Data Access Language (DAL) Server to support IBM's AS/400 family of mid-range computers. For those not familiar with the client/server world, this article answers some questions about these products.

DISCUSSION ----------

Q: What is a DAL?
A: DAL is software that resides on both the AS/400 (server) and the Macintosh (client). The software allows Macintosh applications to use/access the client to make SQL queries of data on the host.

Q: What does DAL mean?
A: DAL stands for Data Access Language, and it means being able to enter the AS/400 system (server) via a desktop computer (client) and access database information. That information can then be brought onto the desktop system where it can be manipulated and managed the same as any application on the desktop. Data access is different than accessing a file server. With a file server, the desktop user is able to drag or copy an entire file from the server such as a letter, an application, or an entire spreadsheet (file transfer). Data access allows the desktop user to selectively retrieve portions of data (not the entire file or database that may be millions of records large) by interacting with the server's database management system to obtain the specific

data the desktop user needs.

Q: Is it only for IBM midrange and mainframe computers?
A: No. DAL has been in existence for three years and permits connectivity with a number of platforms, including Digital VAX/VMS minicomputers and popular UNIX machines such as Sun Sparc, HP9000, and IBM RS6000, and Mainframes. Including the AS/400, Apple's DAL database connectivity solution includes support for 13 major database host operating environments in addition to 13 different relational databases. In fact, the AS/400 is one of the "last frontiers" for connectivity to IBM hardware by Macintosh.

Q: What is an AS/400 computer and what functions would it typically perform?
A: The AS/400 is a family of midrange computers from IBM, primarily used to run applications software for running a small business or a department or division of a large enterprise as servers to PCs on a network. There are approximately 175,000 AS/400s installed and over 9000 applications packages available. The most common use of AS/400 is to run general purpose business software such as an integrated manufacturing software package that would handle bills of materials, engineering production schedules, order entry, accounts receivable, purchasing, general ledger and payroll. For example at Apple, AS/400 computers have been used to handle product distribution.

Macintosh access to the data used to run and measure a business is becoming increasingly important. To date, access to an AS/400 computer was provided only through terminal emulation, a less than satisfactory solution because terminal emulation does not take advantage of the point-and-click Macintosh user interface; it simply recreates the old character-based terminal interface on the Macintosh. It is expected that this capability will further enhance Apple's attractiveness to large, mid-size and small companies alike.

Q: Describe a typical business scenario of a Macintosh being used to access a AS/400.
A: A typical business scenario would be a mid-sized company that uses the AS/400 to build and store database information, such as sales report information. While this company originally grew up with IBM PCs as the dominant platform, many Macintosh systems are in place for a variety of functions and customers increasingly want to be able to integrate them into the network they already have in place, thus AS/400 connectivity is desired.

Another important thing to consider as you look at typical scenarios is the growing popularity of the PowerBook by large sales forces. As in the example above, many of these sales people using PowerBooks have a need to access information residing in the AS/400 servers, such as sales info or the sales history of a particular company, while they're on the road. The DAL Server for AS/400 will allow them to access that information.

Multivendor Network Solutions Guide: How to Order

==========

Article Created: 9 October 1992
Article Reviewed/Updated: 27 July 1993

TOPIC ----------

How can I order "Apple Multivendor Network Solutions Guide"?

DISCUSSION ----------

The "Apple Multivendor Network Solutions Guide" is available from Apple StartingLine (formerly Apple InPrint). Order part number M6198/D.

This guide describes networking solutions and environments. It also gives company contact information for the third-party companies that sell networking products compatible with Apple products.

The Solutions section provides overviews and specific technology for:

- Data links
- Internetworking
- Network systems
- Network services
- Application development tools
- Network management tools
- Telecommunications
- Network support and training services

The Environments section describes:

- A/UX
- Banyan
- Digital Equipment Corporation
- Hewlett-Packard
- IBM
- Microsoft
- Novell

- Prime
- Sun Microsystems
- Tandem
- UNIX
- Wang

Article Change History:

LaserWriter Toner Cartridges May Be Reconditioned (2/95)

Revised: 2/2/95
Security: Everyone

LaserWriter Toner Cartridges May Be Reconditioned (2/95)

==========

Article Created: 23 November 1992
Article Reviewed/Updated: 02 February 1995

TOPIC ----------

The latest LaserWriter toner cartridges have a sticker that says the cartridge may contain recycled parts. Are these "new" toner cartridges actually refurbished?

DISCUSSION ----------

Beginning in March 1992, Apple started shipping toner cartridges with some recycled parts. This was an environmentally motivated decision to reduce landfill waste and use resources effectively.

The toner cartridges themselves are not recycled or just refilled. They are completely disassembled and some parts are reused or are melted down and recast.

Before implementing this program, Apple conducted extensive testing which compared new toner cartridges to reconditioned ones. Based on the test results, Imaging Engineering determined that the reconditioned toner cartridges have equal or better performance than new toner cartridges.

During Canon's manufacturing process, every toner cartridge receives the label that the toner cartridge "may contain reconditioned parts and remolded materials."

Macintosh: Which Models Can Use Two Chip 1MB SIMMs (3/94)

Revised: 3/31/94
Security: Everyone

Macintosh: Which Models Can Use Two Chip 1MB SIMMs (3/94)

==========

Article Created: 9 October 1992
Article Reviewed/Updated: 31 March 1994

TOPIC ----------

I'm trying to use the new "quad density" 1MB RAM SIMMs (two chips per SIMM) in older Macintosh computers.

By trial and error, I discovered that the two-chip SIMMs won't work in the Macintosh Plus or Macintosh II. I tested some of these SIMMs from a Macintosh Quadra in a revision A Macintosh II and they cause it to fail the memory test.

In what Macintosh computers will these SIMMs work?

DISCUSSION ----------

The two-chip SIMMs are one-megabyte SIMMs that use four megabit components (four megabits per chip times two chips equals 8 megabits -- eight megabits divided by eight bits per byte is one megabyte). The four megabit components are now cheaper than the one megabit components previously used.

The following models do work properly with these two-chip SIMMs:

- Macintosh Classic II
- Macintosh SE/30
- Macintosh LC/LC II
- Macintosh IIsi
- Macintosh IIcx
- Macintosh IIci
- Macintosh IIvx/IIvi
- Macintosh Quadra 700
- Macintosh Quadra 900/950

Article Change History:
31 March 1994 - Clarified title and Topic, clarified which systems support two chip SIMMs, revised formatting.

LaserWriter IIf & IIg 2.0 ROMs: Issues Addressed (7/95)

Revised: 7/7/95
Security: Everyone

LaserWriter IIf & IIg 2.0 ROMs: Issues Addressed (7/95)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 07 July 1995

TOPIC ----------

What issues do the LaserWriter IIf/IIg Revision 2.0 ROMs address and correct?

DISCUSSION ----------

The Revision 2.0 ROM release for the LaserWriter IIf and IIg controller boards corrects these problems:

- The inability to place the LaserWriter IIg in different zones or to rename it, with the Namer application, on an EtherTalk network.

Note:
This does not apply to the LaserWriter IIf because it does not have EtherTalk capabilities.

- The inability to return proper font outlines to a limited number of font manipulation packages using the PostScript "pathforall" operator.

. In this situation, the application cannot retrieve a bitmapped font
. from the printer when the application requests one.

- Incompatibility with spoolers resulting in incomplete print jobs, printing errors, and the inability to capture the printer on the spooler.

- Serial port errors resulting from the printer echoing an extra end-of-file indicator (Control-D).

. In this situation, the printer status indicates busy when actually
. it is idle.

- Difficulty connecting some third-party hard drives to a LaserWriter IIf or IIg.

. When using the LaserWriter Utility, the user is unable to "see" the
. hard drive attached to the LaserWriter.

Note:
Some third-party hard drives may not be compatible with Apple products, regardless of this ROM upgrade. Check product compatibility with the hard drive manufacturer.

If your LaserWriter IIf or IIg is experiencing any of these problems, contact your Authorized Service Provider to purchase the LaserWriter IIf/IIg 2.0 ROM upgrade. This upgrade is only available as a service upgrade, and it is not a user installable upgrade.

LaserWriter Utility 7.2 and 7.3: Difference

Revised: 10/8/92
Security: Everyone

LaserWriter Utility 7.2 and 7.3: Difference

==========

Article Created: 19 October 1992

TOPIC --------------------

What is the difference between LaserWriter Utility 7.2 and 7.3?

DISCUSSION --------------------

LaserWriter Utility 7.3 lets the user put a LaserWriter IIg on an Ethernet network in any zone that has been defined for that Ethernet network.

For information on the problems corrected with the Revision 2.0 ROMs, see Tech Info Library article "LaserWriter IIf & IIg Revision 2.0 ROMs: Issues Addressed."

LaserWriter Driver 7.1.1 and 7.1.2: Differences

Revised: 11/11/92
Security: Everyone

LaserWriter Driver 7.1.1 and 7.1.2: Differences

==========

Article Created: 8 October 1992

TOPIC ----------

What are the differences between LaserWriter Drivers 7.1.1 and 7.1.2? When should a user upgrade?

DISCUSSION ----------

The changes in LaserWriter Driver 7.1.2 are as follows:

- Support for the Fonts Folder within the System Folder of System 7.1.

- Workaround for a very rare bug in the LaserWriter IIg: printing TrueType fonts after they are downloaded to the printer's hard drive sometimes results in incorrect or no output.

- Fix for a very rare bug when printing to a Personal LaserWriter NTR with some TrueType fonts: the printer purges the current job and restarts.

- Support for fonts with foreign names.

- Enhanced printer memory allocation when printing with TrueType fonts.

Apple recommends upgrading to this driver if you are:
- Using System 7.1.
- Printing TrueType fonts to a LaserWriter IIg with a hard drive.
- Printing TrueType fonts to a Personal LaserWriter NTR.
- Using international system software.

Macintosh IIvx: Displays Larger than 14 Inches (7/93)

Revised: 7/19/93
Security: Everyone

Macintosh IIvx: Displays Larger than 14 Inches (7/93)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 12 July 1993

TOPIC ----------

Why doesn't the Macintosh IIvx support monitors larger than 14 inches?

DISCUSSION ----------

The Macintosh IIvx (Performa 600) has internal video support for the 12-inch, 13-inch, 14-inch, and VGA (Video Graphics Array) displays. However, the internal video doesn't support monitors greater than 14 inches.

Macintosh IIvx video logic is based on the Macintosh LC II. Time to market urgency made major alterations of the Macintosh LC ASIC impossible.

Customers must purchase an appropriate NuBus Card such as the Macintosh Display Card 8•24 to drive their larger monitors.

Article Change History:
07/12/93 - Revised to include 14-inch color displays, and Performa 600.

Macintosh IIvx: Why a Sheet Metal Enclosure

Revised: 10/13/92
Security: Everyone

Macintosh IIvx: Why a Sheet Metal Enclosure

==========

Article Created: October 19, 1992

TOPIC -----

Why did Apple select the sheet metal box enclosure for the Macintosh IIvx?

DISCUSSION -----

There are several advantages to the new sheet metal box over the previously used molded plastic.

- Metal is a natural EMI (Electro-magnetic Interference) barrier. On molded plastic systems, expensive coatings must be used on the inside as a shield.

- The longevity of a tool used to fabricate a metal cabinet is 3 times as long as that for a plastic mold.

- The roomier size supports many potential configurations. The front and rear bezels are product-specific but the rest of the container is designed to adapt to several different product designs.

Macintosh IIvx/Centris/Quadra 650: Logic Board Upgrade (8/94)

Revised: 8/5/94
Security: Everyone

Macintosh IIvx/Centris/Quadra 650: Logic Board Upgrade (8/94)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 13 July 1993

TOPIC ----------

What logic board upgrade options are available for the Macintosh IIvx, Centris 650, or Quadra 650?

DISCUSSION ----------

Wherever possible, Apple has given customers the opportunity to upgrade to a newer logic board. Apple has made available a logic board to upgrade a Macintosh IIvx, Performa 600, or Quadra/Centris 650 to a Power Macintosh 7100/66 or 7100/66AV model.

The part number for the 7100/66 is M2474LL/A. The part number for the 7100/66AV model is M2840LL/A.

For details about this upgrade contact your local Apple authorized dealer.

Article Change History:
05 Aug 1994 - Revised to show upgrade to Power Macintosh 7100/66.
13 Jul 1993 - Revised to add available upgrade path to Centris 650.

Macintosh IIvx: Not Designed to Operate Vertically (7/93)

Revised: 9/14/93
Security: Everyone

Macintosh IIvx: Not Designed to Operate Vertically (7/93)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 14 September 1993

TOPIC ----------

Can I operate my Macintosh IIvx in a vertical position?

DISCUSSION ----------

The Macintosh IIvx (and the similar Performa 600 and Centris 650) were designed, built, and tested to perform reliably in the horizontal position. When operated in the horizontal position, these computers meet or exceed Apple Computer's regulatory compliance specifications. Using these computers in any other orientation may damage sensitive internal components and isn't recommended.

Further, when you place one of these computers on a work surface, be sure the L on the left side of the system remains unobstructed.

However, should you require a vertical position for your system, you must use an appropriate accessory stand to ensure regulatory compliance and continued reliability. An appropriate stand holds the computer safely without disrupting the air flow that keeps the computer's components cool. (The Apple CD 300i functions properly on its side.)

Article Change History:
07/13/93 - Revised to include Performa 600.
09/14/93 - Revised to include Centris 650.

MacX 1.2 Distribution Channels and Support

Revised: 10/13/92
Security: Everyone

MacX 1.2 Distribution Channels and Support

==========

Article Created: October 19, 1992

TOPIC -----

How will MacX 1.2 be distributed and supported?

DISCUSSION -----

Sales Channels:
• Apple direct sales force, NAES, SEs.
• Product availability through Apple resellers.
• Product availability through UNIX resellers: Ingram, Merisel, MicroD.
• Apple Direct (800#) product availability, effective October 1, 1992.

Support:
• Built-in 30-day customer assistance phone support.
• Additional support available through 6-incident call or yearly contract.

Macintosh IIvx: IIci Cache Card, Accelerator Slot Incompatible

Revised: 10/13/92
Security: Everyone

Macintosh IIvx: IIci Cache Card, Accelerator Slot Incompatible

==========

Article Created: October 19, 1992

TOPIC ----------

Can I use the IIci Cache Card in the new Accelerator slot?

DISCUSSION ----------

No. The Macintosh IIci Cache Card is incompatible with the new accelerator slot. The accelerator slot does not accommodate cache-only cards.

Macintosh IIvx has its cache architecture on the logic board, which means the accelerator slot is left open for a third-party accelerator card.

Accelerator cards such as 50 MHz 68030s or cards based on 68040s are meant for this slot.

MacX 1.2 Product Overview (4/95)

Revised: 4/26/95
Security: Everyone

MacX 1.2 Product Overview (4/95)

==========

Article Created: 9 October 1992
Article Reviewed/Updated: 26 April 1995

TOPIC ----------

This article is an overview of MacX 1.2 and its new features.

DISCUSSION ----------

MacX 1.2 is the current revision of MacX that retains the benefits of the earlier releases and primarily offers compatibility with the latest release of the Macintosh Operating System 7.1 and later. Aside from bug fixes, here are the major differences between MacX 1.1.7 and 1.2:

• System 7.1 and later compatibility. MacX 1.2 is compatible with all versions of the Macintosh Operating System from 6.0.5 to 7.x -- and A/UX versions 2.0, 2.0.1, and 3.x.

• Backing Store & Save Under. MacX 1.2 provides industry-standard Backing Store and Save Under capability, allowing users to regulate the frequency of window display updates to improve accuracy and performance

• Colormap, Animation & Host Access control defaults. A number of defaults have been changed to improve application compatibility and user convenience. Disable smooth animation by default for improved performance. Disable host access alert boxes by default.

MacX 1.2 retains the following major features supported in earlier versions:

• X Window System standard conformance. MacX implements the X Window System Version 11, Release 4 standard, ICCCM window management, XLFD font protocol.

• Macintosh System 7. MacX users can take advantage of complete System 7 functionality and intuitive interface while accessing X applications.

• Macintosh applications. Thousands of easy-to-use, consistent applications available to use on the same desktop as X Window System applications.

• Macintosh Windows and Ease-of-use. X applications appear in Macintosh windows for easy moving and resizing. MacX allows users to access and customize clients using Macintosh pull down menus.

• Copy & Paste between Macintosh and X. Users can share text and color graphics data between X Window System and Macintosh applications by simply using Copy & Paste.

• Open System networking. Supports all major networking protocols for the Macintosh: AppleTalk, TCP/IP, DECnet.

• Macintosh platform & technology. Support for all Macintosh computers. Runs on Mac OS and A/UX. Supports multiple monitors and 8-bit color.

Article Change History:
26 Apr 1995 - Made correction of typographical errors.
02 Feb 1995 - Changed keywords.

Macintosh IIvx: B & W Mode Unsupported by 12 RBG Display

Revised: 10/13/92
Security: Everyone

Macintosh IIvx: B & W Mode Unsupported by 12" RBG Display

==========

Article Created: October 19, 1992

TOPIC ----------

Why doesn't my Macintosh IIvx support black and white mode on my 12" RBG Display?

DISCUSSION ----------

The Macintosh IIvx internal video logic does not support one bit per pixel mode on the 12" RBG Display.

When the Monitors desk accessory is launched, only 2, 4, 8, and 16 bits per pixel options are offered for that display.

There may be some applications that require black and white mode.

MacX: Target Markets

Revised: 10/13/92
Security: Everyone

MacX: Target Markets

==========

Article Created: 9 October, 1992

TOPIC ----------

Why was MacX developed, and what are its target markets?

DISCUSSION ----------

X Window System was developed, and was initially adopted, by the technical and scientific community using UNIX workstations as their primary system for the development and deployment of X Window System applications. As a networked based client/server solution, X is now becoming more and more popular in large business environments as well as government agencies, universities and research institutes. Target market can more specifically described as follows:

- IS/MIS managers and programmers developing and using in-house and commercial X Window System applications for open systems. These applications can then be accessed throughout the whole organization using UNIX workstations, X terminals, or Macintosh computers running MacX.

- Target markets operate in multi-vendor environments where both UNIX machines and Macintosh computers for productivity applications are present.

Macintosh IIvx: How It Differs from Performa 600

Revised: 10/13/92
Security: Everyone

Macintosh IIvx: How It Differs from Performa 600

==========

Article Created: October 19, 1992

TOPIC -----

What is the difference between the Macintosh IIvx and the Performa 600?

DISCUSSION -----

The Macintosh IIvx is identical to the Performa 600 except for the following:

Macintosh IIvx

- Features a 68882 math coprocessor, running at 32 MHz, which executes mathematical computations quickly.

- Has a built-in 32K direct-mapped cache.

Performa 600

- Will be distributed through new consumer-channel dealers only.

- Is bundled with the following:
  Apple Extended Keyboard
  Application software
  Simplified interface for new users
  Special warranty service program

Macintosh IIvx: Description (Discontinued)

Revised: 6/2/94
Security: Everyone

Macintosh IIvx: Description (Discontinued)

==========

Article Created: October 19, 1992

TOPIC ----------

This article describes the features and benefits of the Macintosh IIvx.

DISCUSSION ----------

The Macintosh IIvx is a mid-range Macintosh, similar to the Macintosh IIci and IIsi while offering greater expansion flexibility and improved internal video support. It is identical to the Performa 600, except it has a built-in 32MHz 68882 math coprocessor and 32K direct-mapped cache.

The Macintosh IIvx has a new sheet-metal enclosure, which allows for three expansion slots, a built-in hard disk, floppy and an optional built-in AppleCD 300i drive.

The optional built-in AppleCD 300i is a double-speed drive (twice as fast as most currently available CD-ROM drives) that supports multiple-session Kodak Photo CD technology.

Product Features

Power and speed
- 32MHz 68030 microprocessor
- 32MHz 68882 math coprocessor (FPU)
- 32K cache

Memory
- 4MB RAM, expandable to 68MB

Expansion
- Room for three internal storage devices, including the AppleCD 300i internal CD-ROM drive
- Three NuBus expansion slots
- One accelerator slot

Display
• Built-in support for Apple monitors
• 256 colors, expandable to 32,000

Macintosh IIvx: Control Chips (7/93)

Revised: 7/19/93
Security: Everyone

Macintosh IIvx: Control Chips (7/93)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 12 July 1993

TOPIC -----

This article describes the Macintosh IIvx (Performa 600) control chips.

DISCUSSION -----

VASP

The VASP controls all timing, video generation, memory mapping, sound, and clock generation. VASP is a modification of the V8 ASIC used in the Macintosh LC and Macintosh LC II.

Ariel

Ariel is the 256x24 bit color look-up table (CLUT) for Macintosh IIvx.

CoMBo Chip (85C80)

The CoMBo chip provides identical serial and SCSI interface control for Macintosh IIvx. Macintosh IIvx provides on-board SCSI termination when no external SCSI device is connected to the DB-25 connector.

Egret (68HC05)

The Egret chip provides keyboard scanning, real-time clock, ADB interface, parameter RAM storage, power on reset, and power supply control.

Macintosh IIvx: Memory (7/93)

Revised: 7/19/93
Security: Everyone

Macintosh IIvx: Memory (7/93)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 12 July 1993

TOPIC ----------

This article describes the Macintosh IIvx (Performa 600 and Performa 600CD) DRAM, VRAM, ROM configurations, and the Memory Map.

DISCUSSION ----------

DRAM (Dynamic Random Access Memory)

All Macintosh IIvx configurations have 4MB of DRAM soldered to the logic board. The 5MB configuration with the AppleCD 300i CD-ROM drive has another 1MB of DRAM installed in the four 30-pin DRAM SIMM sockets. The sockets support up to 16MB DRAM SIMMs, for a maximum of 68MB. All DRAM must be at least 80 ns fast page mode.

Possible DRAM Configurations

4MB	4MB soldered to logic board, empty SIMMs
5MB	4MB soldered and 1MB in SIMMs (four 256K SIMMs)
8MB	4MB soldered and 4MB in SIMMs (four 1MB SIMMs)
12MB	4MB soldered and 8MB in SIMMs (four 2MB SIMMs)
20MB	4MB soldered and 16MB in SIMMs (four 4MB SIMMs)
68MB	4MB soldered and 64MB in SIMMs (four 16MB SIMMs)

VRAM (Video RAM)

The Macintosh IIvx uses VRAM for video and sound data storage. This internal video support is similar to that of the Macintosh LC and Macintosh LC II. It's an improvement on the Macintosh IIci and IIsi scheme, which uses available main DRAM for video and sound, causing delays when both the video circuitry and the CPU were accessing DRAM at the same time. The VRAM is installed into two 68-pin SIMM sockets with pinouts identical to that of VRAM sockets on the Macintosh LC and Macintosh Quadras. Both SIMM sockets

must be filled with either 256K or 512K SIMMs. The video data path is 32 bits wide.

Two 256K SIMMs (part #M5953LL/A) yield 512K of VRAM and support 640 x 480 monitors at up to 8 bits per pixel (256 colors or shades of gray) or 512 x 384 monitors at up to 16 bits per pixel (thousands of colors).

Two 512K SIMMs (part #M0517LL/A) yield 1MB of VRAM, which supports 640 x 480 and 512 x 384 monitors at up to 16 bits per pixel. This 1MB VRAM configuration is standard on any Macintosh IIvx configured with the AppleCD 300i.

ROM

Macintosh IIvx has 1MB of ROM and can be upgraded via the ROM expansion SIMM (for ROM SIMM pinout see article "Macintosh IIvx: Pinouts").

Memory Map (32-bit)

DRAM —4MB on logic board	$00000000 - $003FFFFF	
Expansion DRAM (in SIMMs)	$00400000 - $043FFFFF	(up to 68MB)
Unassigned DRAM space	$04400000 - $3FFFFFFF	
ROM read	$40000000 - $403FFFFF	
ROM flash write	$40400000 - $407FFFFF	
Repeated ROM images	$40800000 - $4FFFFFFF	
VIA1	$50x00000 - $50x01FFF	(x = $0 - F)
SCC	$50x04000 - $50x05FFF	
SCSI	$50x10000 - $50x11FFF	
SCSI DMA	$50x12000 - $50x13FFF	
SCSI Handshake	$50x06000 - $50x07FFF	
Sound	$50x14000 - $50x15FFF	
SWIM	$50x16000 - $50x17FFF	
VDAC	$50x24000 - $50x25FFF	
VIA2/VASP registers	$50x26000 - $50x27FFF	
CPUID	$5FFFFFFC - $5FFFFFFF	
VRAM	$60000000 - $600FFFFF	(up to 1MB)
VRAM repeated images	$60100000 - $6FFFFFFF	
NuBus space	$70000000 - $FFFFFFFF

Macintosh IIvx: Sound Capability

Revised: 10/13/92
Security: Everyone

Macintosh IIvx: Sound Capability

==========

Article Created: October 19, 1992

TOPIC --------------------

This article describes the Macintosh IIvx sound capabilities.

DISCUSSION --------------------

All sound processing in the Macintosh IIvx is accomplished by the VASP gate array. The sound system includes one built-in speaker and an external stereo headphone jack.

CD audio tracks are played back through the external speaker/earphone jack in stereo. Macintosh sounds are played in mono through both channels.

If no headphone is attached, CD audio plays through the internal speaker in mono. System beeps and CD audio are mixed together so both can be heard through either the headphone or internal speaker.

Sound input is accomplished through a stereo mini-phone jack.

Macintosh IIvx: NuBus Expansion and Accelerator Slots (7/93)

Revised: 7/19/93
Security: Everyone

Macintosh IIvx: NuBus Expansion and Accelerator Slots (7/93)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 13 July 1993

TOPIC ----------

This article describes the Macintosh IIvx (Performa 600) expansion possibilities.

DISCUSSION ----------

The Macintosh IIvx features three NuBus expansion slots and one accelerator card slot. The power budget for each NuBus slot is 13.9 watts (same as the Macintosh IIci) for a total of 41.7 watts.

The power budget for the accelerator card slot is 5 watts (same as the Macintosh IIci cache budget). Accelerator cards must conform to a 3 by 6 inch form factor (identical to the Macintosh IIci cache card form factor).

There are no openings on the back of the Macintosh IIvx enclosure to support external connections to the accelerator card. The accelerator connector signals are a subset of those provided by the Macintosh IIci cache connector. Processor address, data, and some control signals are provided. Cache control signals are NOT provided. Some third-party cards that work in the Macintosh IIci will work on the Macintosh IIvx, but the IIci cache card will not.

Macintosh IIvx does not have on-board Ethernet, but it can be added via the three NuBus expansion slots.

Macintosh IIvx: Internal Video Support

Revised: 10/13/92
Security: Everyone

Macintosh IIvx: Internal Video Support

==========

Article Created: October 19, 1992

TOPIC ----------

This article describes the Macintosh IIvx internal video monitor support.

DISCUSSION ----------

The following chart lists the monitors supported by Macintosh IIvx internal video:

MON ID 3 2 1	Monitor Selected	Cols/ Rows	Vertical Refresh	Horizontal Refresh	Bandwidth
0 0 1	reserved				
0 1 0	12" RGB	512 x 384	60.15 Hz	24.48 KHz	15.6672 MHz
1 1 0	12" B/W, 13" RGB	640 x 480	66.67 Hz	35.0 KHz	30.24 MHz
0 0 0	reserved				
0 1 1	VGA	640 x 480	59.94 Hz	31.47 kHz	25.18 MHz
1 0 0	reserved				
1 0 1	reserved				
1 1 1	no monitor connected				

* 640 x 480 displays are supported at 8 bits/pixel with 512K VRAM and 16 bits/pixel with 1MB of VRAM

Note: The monitor ID pins 3, 2, and 1 refer to pins 10, 7, and 4 on the

DB-15 external video port.

The monitor ID must be asserted in the monitor by grounding lines for 0's and leaving no connection for 1's. No connects are pulled high by pullup resistors on the Macintosh IIvx logic board.

Standard Macintosh video timing calls for a 30.24 MHz pixel clock for 640 x 480 displays. Macintosh IIvx deviates from the standard by using the CPU clock, at 31.3344 MHz, as a pixel clock for those displays. This results in an extra 32 pixels per horizontal line. The active pixels are center in the active video field with 16 extra pixels on each side. Horizontal and vertical scan rates remain unchanged. The effect of this change is that square pixels are visually 3% thinner. The Macintosh 12" Monochrome Display compensates for this aberration, but the 13" Color Display does not. Monitor ID 2 is grounded within Macintosh IIvx which triggers the 12" Monochrome Display to realize that it is connected to a Macintosh IIvx and allows the monitor to compensate for the slightly different timing.

VGA monitors use the monitor ID of 011, which is the same as the Two-page Monochrome Monitor. VGA monitors use the extended monitor sense codes, which is enabled by tying the ID 3 and ID 2 lines together at the monitor end. The extended sense for a VGA monitor is 01 01 11.

One other anomaly in Macintosh IIvx is that it does not support 1 bit/pixel mode on 512 x 384 monitors.

Macintosh IIvx: Pinouts

==========

Article Created: October 19, 1992

TOPIC --------------------

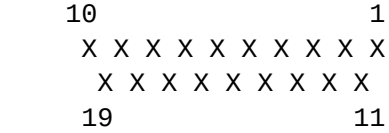
This article describes the external and internal pinouts for the Macintosh IIvx computer system.

DISCUSSION --------------------

EXTERNAL PORT PINOUTS

The pinouts listed are for the back of the Macintosh IIvx.

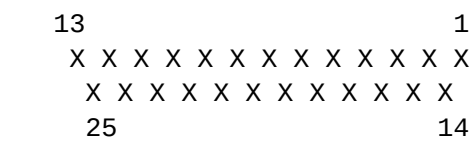
DB-19 External Drive Connector



Pin	Signal	Description
1, 2, 3, 4	GND	Ground
5	-12 V	-12 Volt Supply
6	+5 V	+5 Volt Supply
7	+12 V	+12 Volt Supply
8	12 V	+12 Volt Supply
9	nc	(Not Connected)
10	+5 V	+5 Volt Supply
11	PHASE0	Motor Phase 0 Output
12	PHASE1	Motor Phase 1 Output
13	PHASE2	Motor Phase 2 Output
14	PHASE3	Motor Phase 3 Output

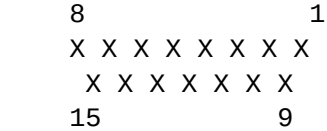
15	W/REQ	Write Request
16	SEL	Register Select Line
17	ENABLE2	Drive Enable
18	RD	Read Data Input
19	WR	Write Data Output

DB-25 External SCSI Connector



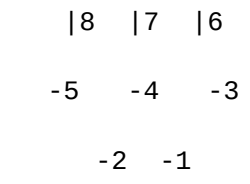
Pin	Signal	Description
1	REQ~	Request
2	MSG~	Message
3	I/O~	Input/Output
4	RST~	SCSI Bus Reset
5	ACK~	Acknowledge
6	BSY~	Busy
7	GND	Ground
8	DB0~	Data bit 0
9	GND	Ground
10	DB3~	Data bit 3
11	DB5~	Data bit 5
12	DB6~	Data bit 6
13	DB7~	Data bit 7
14	GND	Ground
15	C/D~	Command/Data
16	GND	Ground
17	ATN~	Attention
18	GND	Ground
19	SEL~	Select
20	DBP~	Data parity
21	DB1~	Data bit 1
22	DB2~	Data bit 2
23	DB4~	Data bit 4
24	GND	Ground
25	TPWR	Terminator power

DB-15 Monitor Video Connector



Pin	Signal	Description
1	RED.GND	Red Video Ground
2	RED.VID	Red Video
3	CSYNC~	Composite Sync.
4	MON.ID1	Monitor ID, Bit 1
5	GRN.VID	Green Video
6	GRN.GND	Green Video Ground
7	MON.ID2	Monitor ID, Bit 2
8	nc	(Not Connected)
9	BLU.VID	Blue Video
10	MON.ID3	Monitor ID, Bit 3
11	C&VSYNC.GND	CSYNC & VSYNC Ground
12	VSYNC~	Vertical Sync.
13	BLU.GND	Blue Ground
14	HSYNC.GND	HSYNC Ground
15	HSYNC~	Horizontal Sync.
Shell	CHASSIS.GND	Chassis Ground

Mini DIN-8 RS-232/RS-422 Serial Connector



Pin	Signal	Description
1	HSKo	Handshake Output DTR
2	HSKi	Handshake Input CTS
3	TxD-	Transmit Data (inverted)
4	SG	Signal Ground
5	RxD-	Receive Data (inverted)
6	TxD+	Transmit Data
7	GPi	General Purpose Input DCD
8	RxD+	Receive Data

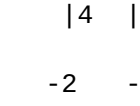
Miniature Sound Input Jack

Contact	Signal	Description
Sleeve	GND	Signal ground
Ring Mic	PWR	Microphone power, +8 V +/- 5% @ 1 mA
Tip	SND.IN	Sound input signal, 1.6 K Ω +/- 10 % impedance, 4 mV max signal w/o clipping

Miniature Stereo Sound Output Jack

Contact	Signal	Description
Sleeve	GND	Signal ground
Ring	RIGHT	Right Channel, 1.5 V peak-to-peak audio signal
Tip	LEFT	Left Channel, 1.5 V peak-to-peak audio signal

Mini DIN-4 Apple Desktop Bus Connector



Pin	Signal	Description
1	DATA	ADB Data
2	PO	Power On
3	+5 V	+5 Volt
4	GND	Ground

INTERNAL PORT PINOUTS

The pinouts listed are for the internal connectors on the Macintosh IIvx logic board.

NOTES

Notes and differences between Macintosh IIvx and IIvi and Macintosh IIci:

pullup[1]: This pin was connected to STERM* on the Macintosh IIci cache connector. STERM is not generated by any logic on the motherboard. This signal is pulled up with a 1K resistor.

pullup[2]: This pin was connected to CFLUSH* on the Macintosh IIci cache connector. The cache flush function is different on Macintosh IIvx, so this pin cannot be supported. It is pulled up with a 1K resistor.

pulldown[3]: This pin was connected to CACHEENABLE* on the Macintosh IIci cache connector. The cache enable function is different on Macintosh IIvx, so this pin cannot be supported. It is pulled down with a 100 ohm resistor. NOTE: THIS IS THE CACHE ENABLED STATE.

pulldown[4]: This pin was a no connect on the Macintosh IIci cache connector. It is pulled down with a 100 ohm resistor to allow certain third party accelerator cards to operate correctly.

FPU* [5]: This signal was a no connect on the Macintosh IIci cache connector. It is now connected to the FPU decode logic on the PCB. This logic is active at all times. The logic board FPU, if present is disabled if the CPUDISable signal is asserted.

15.6672 MHz [6]: This signal was the 25 MHz CPU clock on the Macintosh IIci cache connector. It is now the 15.6672 MHz clock generated from the VASP for all systems. It is not the 31.3344 MHz CPU clock for the Macintosh IIvx. This clock was chosen because it must be used to synchronize access to the VASP chip, which always operates at 15.6672 MHz.

Macintosh IIvx: Specifications (Discontinued 10/93)

Revised: 10/21/93
Security: Everyone

Macintosh IIvx: Specifications (Discontinued 10/93)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 05 November 1992

TOPIC ----------

This article provides the technical specifications for the Macintosh IIvx computer system.

Microprocessor

- 68030, running at 32 MHz
- 68882 math coprocessor, running at 32 MHz
- Integral Paged Memory Management Unit (PMMU)

Cache

- 32K cache

Memory (DRAM)

- 4MB of RAM standard
- Expands to up to 68MB of RAM by installing four 16MB SIMMs in the expansion bank
- Includes RAM disk software
- 80 ns fast page mode (or faster)

Disk storage

- 1.4MB internal Apple SuperDrive
- Support for one 3.5-in. hard disk drive
- Support for one 5.25-in. half-height device, such as the AppleCD 300i internal CD-ROM drive.

AppleCD 300i configuration

- operates at twice the speed of ordinary CD-ROM drives
- Data streaming rate, double speed (2x)
  - Mode 1: 300 KB/sec
  - Mode 2: 342 KB/sec
- Automatic lens cleaning and double front-loading door for dust protection
- Auto-inject caddy loading
- Support for multi-session Kodak Photo CD format
- Support for bootable CDs
- 5MB RAM
- 1MB video RAM

Video display

- Supports Apple monochrome and color monitors, including:
  - Macintosh 12" Monochrome Display
  - Macintosh 12" RGB Display
  - AppleColor High-Resolution RGB Monitor
  - Macintosh Color Display
- Supports some VGA monitors

Video RAM (VRAM)

- 512K minimum supports 256 colors on Apple color video displays listed above
- Expandable to 1MB for support of 32,000 colors on the same displays

Interfaces

- Three internal NuBus expansion slots
- One accelerator slot
- SCSI bus interface
- Video port to support RGB and monochrome monitors of various sizes and resolutions
- One sound output port for stereo playback from CDs and monaural playback of Macintosh sounds
- One sound input port
- Two serial (RS-232/RS-422) ports, 230.4 Kbit/sec maximum (up to 0.920 Mbit/sec if clocked externally)
- Two Apple Desktop Bus (ADB) ports, supporting a keyboard, mouse, and other devices daisy-chained through a synchronous serial bus

Keyboard

- Supports all Apple Desktop Bus keyboards

Mouse

- Apple Desktop Bus Mouse; mechanical tracking, optical shaft, or contact encoding

Sound generator

- Custom Sound Chip drives stereo miniature headphone jack

Clock/calendar

• Custom chip with long-life lithium battery

Microphone

• Electret, omnidirectional; output voltage is 4 mV, peak to peak, at normal volume

Disability access

• CloseView, Easy Access, and visible beep are included with system software. These built-in features and third-party options provide alternative input and output tools for people with disabilities.

Electrical requirements

• Line voltage: 100 to 240 V AC, RMS automatically configured
• Frequency: 50 to 60 Hz, single phase
• Power: 112 W maximum, not including monitor power

ADB power requirements

• Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
• Mouse draws 10 mA
• Keyboard draws 25 to 80 mA, depending on the keyboard model used

Operating environment

• Operating temperature: 50° F to 104° F (10° C to 40° C)
• Storage temperature: -40° F to 116.6° F (-40° C to 47° C)
• Relative humidity: 5% to 95% noncondensing
• Maximum altitude: 10,000 ft. (3,048 m)

Size and Weight

Main unit:
• Height: 6.0 in. (15.2 cm)
• Width: 13.0 in. (33.0 cm)
• Depth: 16.5 in. (41.9 cm)
• Weight: 25 lbs. (11.3 kg)
weight varies with internal devices installed

Mouse

• Height: 1.1 in. (2.8 cm)
• Width: 2.1 in. (5.3 cm)
• Depth: 3.8 in. (9.7 cm)
• Weight: 6 oz. (170 g)

System Software Requirements

Macintosh IIvx uses System 7.1

Apple Ethernet NB Card: Specifications

Revised: 11/11/92
Security: Everyone

Apple Ethernet NB Card: Specifications

==========

Article Created: 29 September 1992

TOPIC ----------

This article gives technical specifications for the Apple Ethernet NB Card.

DISCUSSION ----------

The Apple Ethernet NB Card provides physical and link level access to data communications networks meeting IEEE 802.3 and 802.2 Logical Link Control (LLC) type 1 standards. Several networking protocols can be used with the Ethernet NB Card.

Configurations

- AppleTalk protocol, Macintosh OS, EtherTalk software
- AppleTalk protocol, A/UX, EtherTalk for A/UX software
- TCP/IP protocol, Macintosh OS, MacTCP software
- TCP/IP and NFS, A/UX, B-NET software

Connector

- Apple Ethernet

Transmit/Receive Data Rate

- 10-megabits-per-second maximum data rate

Processor

- Motorola 68000 running at 10 megahertz

RAM

- 512K standard, expandable to 1MB with Apple order No. M0145LL/A,

or 2.5MB with third-party memory expansion modules

Environmental Requirements

- Operating Temperature
  50° F to 104° F (10° C to 40° C)
- Humidity
  20% to 95% noncondensing at a temperature range of
  25° C to 40° C

Ethernet Controller

- National Semiconductor DP83932 (SONIC)

System Requirements

- Macintosh II family
  In addition to the Apple Ethernet NB Card and accompanying software, the following are required to connect one of the Macintosh II family of personal computers to an Ethernet network:
  - One available NuBus slot in the computer. Or, with the Macintosh IIsi, a NuBus Adapter Card. Macintosh system software version 6.0.4 or later; or A/UX system software version 2.0 or later.
  - If you're using AppleTalk network services, the network must use AppleTalk Phase 2 protocols.
  - An Apple Ethernet Cable System media adapter.

- Apple Ethernet Thin Coax Transceiver
  Provides plug-and-play networking in a high-performance Ethernet environment. The Ethernet NB Card, the Apple Ethernet Thin Coax Transceiver, and the 2-meter segment of thin coaxial cable included with the Transceiver are all you need to connect your Macintosh NB computer to an Ethernet network. No terminators or other Ethernet hardware is required.

  The Apple Ethernet Self-Terminating Cable -- 5 Meter and Apple Ethernet Self-Terminating Cable -- 13-Meter Plenum, or other RG 58 A/U thin coaxial cable, can be used to connect devices that are more than 2 meters apart.

- Apple Ethernet Twisted-Pair Transceiver
  The Apple Ethernet Twisted-Pair Transceiver is used to connect the Ethernet NB Card to an Ethernet network using unshielded twisted-pair cable.

  To use Ethernet with unshielded twisted-pair media, you need an IEEE 802.3 10BASE-T-compatible hub, sold separately from third-party vendors.

- Apple Ethernet AUI Adapter
  The Apple Ethernet AUI Adapter provides the Ethernet NB Card

with a standard IEEE 802.3 Attachment Unit Interface (AUI). The AUI can be used to connect the Ethernet NB Card to an external transceiver.

MacTCP 1.1: Internet Address Range 192.0.0.rrr Reserved

Revised: 10/21/92
Security: Everyone

MacTCP 1.1: Internet Address Range 192.0.0.rrr Reserved

==========

Article Created: 13 October 1992

TOPIC ----------

I have a problem with MacTCP 1.1 and applications based on MacTCP, such as NCSA Telnet 2.5 and Oracle for Macintosh OS.

My network number was 192.0.0.rrr; that's the default class C network in MacTCP. Changing the network number made everything work properly.

DISCUSSION ----------

This isn't a bug. According to RFC 1166 (page 47), internet addresses in the range 192.0.0.rrr are reserved. MacTCP knows this, doesn't allow this address to be used, and issues a "bad ip or LAP configuration error" (error id = -23001).

Addresses in the range 192.0.0.rrr are valid, but they are reserved.

MacTCP, MacTCP 1.1.1 inclusive, does have a problem in that it doesn't allow the use of internet addresses in the range 192.0.1.rrr. We have reported this problem to the MacTCP engineering team.

For a complete list of assigned and reserved internet addresses, please see pages 7 through 100 of RFC 1166.

Macintosh RAM: How Long It's Maintained After Power Loss (2/95)

Revised: 2/24/95
Security: Everyone

Macintosh RAM: How Long It's Maintained After Power Loss (2/95)

==========

Article Created: 13 October 1992
Article Reviewed/Updated: 24 February 1995

TOPIC ----------

I have these questions about the Macintosh Quadra computers:

1) What is the specified time period after removing power that volatile component memory loses data?

2) Where is non-volatile memory located, and is memory field addressable?

DISCUSSION ----------

1) This varies from vendor to vendor and from board to board.

According to Apple's Component Engineering group, static RAM loses data seconds after power down.

Dynamic RAM and Video RAM (DRAM and VRAM) are the same in that they both have refresh cycles. There are tiny capacitors internal to these devices that hold a charge. These capacitors are recharged, specified by the manufacturer, every n nanoseconds to preserve the data that has been written to them. Due to these capacitors and the capacitance of the logic board itself, the data will remain for a short time longer than the individual device.

The opinion of Apple's Component Engineering group, based on what has been seen, is DRAM will lose data within 5 minutes after power down.

To ensure that absolutely zero data is stored on DRAM or VRAM devices, allow 30 minutes with power removed from the system.

In addition, the Motorola MC68040 processor has DRAM for cache built in. Motorola doesn't specify how long it takes for the MC68040 to lose its data. However, Motorola feels comfortable with the 30 minute power down time.

2) The only Apple products that contain non-volatile memory are Macintosh systems and LaserWriter printers; mouse devices, keyboards, scanners, tape drives, CD-ROM drives, disk drives, and display systems don't have non-volatile memory. Here are the details:

The Macintosh 128K, Macintosh 512K, and Macintosh 512Ke contain 20 bytes of Parameter RAM (PRAM). These 20 bytes of PRAM are documented on pages II-369 to II-371 of Inside Macintosh Volume II.

The rest of the computers in the Macintosh family have 256 bytes of PRAM -- except for the Macintosh Portable, which has 128 bytes. PRAM only contains configuration information, not user data.

Not all of PRAM is cleared and reset to default values when using the "hold down the Command, Shift, and Option keys while opening the Control Panel" method of System 6, or the Command, Option, P, R keys with System 7. The original 20 bytes of PRAM documented on pages II-369 to II-371 of Inside Macintosh Volume II aren't cleared. Only the other 236 bytes that are considered confidential. This should be sufficient for your needs. Note: The Command, Option, P, R method in System 7 clears all of PRAM and resets it to default values.

The same is true for the non-volatile memory in the Apple LaserWriter printers. Only configuration information like page count, baud rate, emulation mode, and port to use are stored. The printer memory, like a computer's memory, is erased, after a certain amount of time when the power is turned off.

Apple File Exchange and Macintosh PC Exchange: A Comparison

Revised: 11/4/92
Security: Everyone

Apple File Exchange and Macintosh PC Exchange: A Comparison

==========

Article Created: 19 October 1992

TOPIC ----------

This article provides an overview of Apple File Exchange and Macintosh PC Exchange, and compares the two products.

DISCUSSION ----------

Apple File Exchange Overview

Apple File Exchange is a file translation utility that converts a file from one format to another. For example, Apple File Exchange can take a DOS-formatted file and translate it to a Macintosh format. The file can then be opened by Macintosh applications designed to read the format into which the file has been translated.

Macintosh PC Exchange Overview

Macintosh PC Exchange is a software product that lets Macintosh computers, running System 7 and equipped with an Apple SuperDrive or a third-party 5.25-inch MS-DOS-compatible disk drive, easily read, write, and format DOS disks. DOS files appear on the Macintosh desktop just like Macintosh documents, and can be opened, saved, renamed, moved, copied, or deleted. The DOS file format is in no way altered by Macintosh PC Exchange. The application that you specify to open a DOS file must be able to read that DOS file format.

Apple File Exchange and Macintosh PC Exchange: A Comparison

Macintosh PC Exchange is an easier and more intuitive method for opening DOS-format disks. Macintosh PC Exchange also lets the Finder handle DOS files in the same manner as Macintosh files. The main differences between Macintosh PC Exchange and Apple File Exchange are:

- Macintosh PC Exchange is activated when you start up your Macintosh and automatically recognizes a DOS-format disk when it's inserted in an Apple SuperDrive. Apple File Exchange is a separate utility that must be manually launched every time you want to read a DOS disk.

- Macintosh PC Exchange lets you manipulate DOS files in the Finder, just like other Macintosh documents. It also lets you pre-assign the application to open when you double-click a DOS file. Apple File Exchange cannot automatically launch an application when a DOS file is double-clicked.

- Apple File Exchange comes with three special translator files that let you translate documents between Macintosh and DOS file formats. Macintosh PC Exchange doesn't contain any document translation capabilities.

System 7.1: Compatibility with Third-Party Applications

Revised: 10/14/92
Security: Everyone

System 7.1: Compatibility with Third-Party Applications

==========

Article Created: 19 October 1992

TOPIC ----------

Will I have to upgrade my applications to run with System 7.1?

DISCUSSION ----------

Most applications that are compatible with System 7.0 and 7.0.1 are also compatible with System 7.1, although there are a few exceptions.

To determine if the applications you are using will compatible with System 7.1 when you upgrade:

- For System 6.0.X users, run Compatibility Checker 2.0, which is included with your System 7.1 Upgrade Kit on your hard drive. Compatibility Checker 2.0 contains compatibility information on approximately 3500 applications.

- For System 7.0 and 7.0.1 users, check the Software Compatibility list included in the 7.1 Update Kit.

System 7.1: Using Adobe Type Manager (ATM)

Revised: 10/14/92
Security: Everyone

System 7.1: Using Adobe Type Manager (ATM)

==========

Article Created: 19 October 1992

TOPIC ----------

I just upgraded to System 7.1. I'm using Adobe Type Manager, and the on-screen fonts are not smooth.

DISCUSSION ----------

Contact Adobe for a free upgrade to the latest version of ATM. In the meantime, if you're using ATM, you must move any PostScript printer fonts located in the Font folder to the Extensions folder. After you upgrade to the new version of ATM, these fonts will work correctly when placed in the Font folder.

Adobe is offering Apple computer owners a free copy of their latest ATM software. With ATM, you'll gain access to thousands of PostScript Type 1 fonts for use on-screen. ATM software can be used with all Macintosh-supported printers, including the ImageWriter, StyleWriter, and PostScript typesetters.

Adobe is including four typefaces from the Adobe Garamond family with this offer. Adobe is charging only a minimal shipping and handling charge for this software for U.S. and Canadian residents. Orders outside the U.S. and Canada carry a larger shipping and handling charge.

Contact Adobe directly for more details, including shipping and delivery information.

For Adobe contact information, search the Tech Info Library with "Adobe Systems".

System 7.1: New Control Panels

Revised: 10/14/92
Security: Everyone

System 7.1: New Control Panels

==========

Article Created: 19 October 1992

TOPIC -----

This article provides information about the new System 7.1 control panels.

DISCUSSION -----

Date & Time Control Panel

This control panel lets the user change the values for the current date and current time, as well as letting the user customize the date and time formats.

General Controls Control Panel

The General Controls control panel has a new icon with System 7.1.

You can still use the General Controls control panel to change the date and time values, but customizing the date and time formats is handled in the new Date & Time control panel.

Numbers Control Panel

This control panel lets the user set separators for large numbers, and set and position currency symbols.

Text Control Panel

This control panel is for use with WorldScript I and WorldScript II System extensions and provides the user with the ability to switch between languages (alphabets, writing systems) installed on the system.

PowerBook Control Panel

This control panel replaces the Portable control panel that was used with

System 7.0 and 7.0.1 and incorporates several new battery conservation features.

The PowerBook control panel:

- Provides SCSI Disk Mode for those PowerBook computers capable of SCSI Disk Mode.
- Has an Automatic Wake-Up setting.
- Has a single slider bar for Battery Conservation that gives the user a choice of "Maximum Performance" or "Maximum Conservation". This replaces the twin slider bars used in the Portable control panel.

  Below the slider bar is an options button for selecting "Don't sleep when plugged in" to an electrical outlet and for turning the processor cycling on or off.

System 7.1: Fixes Disappearing Folders and Files Problem

Revised: 10/14/92
Security: Everyone

System 7.1: Fixes Disappearing Folders and Files Problem

==========

Article Created: 19 October 1992

TOPIC ----------

Does System 7.1 fix the problem of disappearing folders and files that was reported with System 7.0?

DISCUSSION ----------

System 7.1 includes the contents of the System 7 Tune-Up 1.1.1 disk, as well as Disk First Aid 7.1. Disk First Aid 7.1 now repairs hard drives with the disappearing folders and files problem.

Before this, there was no utility to effectively repair this problem. The only fix was to back up your hard drive and reinitialize the drive.

To prevent this problem from recurring, either upgrade to System 7.1 or install System 7 Tune-Up 1.1.1 over System 7.0 or 7.0.1.

System 7.1: General Description

==========

Article Created: 19 October 1992

TOPIC ----------

This article provides a general description of System 7.1 software.

DISCUSSION ----------

Overview

Macintosh System 7.1 software brings your Apple Macintosh personal computer more powerful capabilities and greater ease of use.

System 7.1 comes with all of the features of the original System 7 release. One of the most significant advances in personal computing since the introduction of the Macintosh, award-winning System 7 makes any Macintosh computer ready for hundreds of applications that take advantage of its power. And since System 7 runs virtually all current applications, you'll enjoy its benefits right away.

Built-in file sharing allows you to share files over an AppleTalk network, simply and easily. Multitasking lets you keep several applications open at once and continue to work while you print, search for, copy, or share files. Publish and Subscribe lets you create links between documents, so when you make a change in one document you see the change made automatically in all related documents -- like spreadsheets, reports, and presentations.

System 7 also includes Apple's TrueType font technology, which displays letters perfectly on the screen with no jagged edges and produces outstanding results from almost any printer. System extensions, like QuickTime, allow you to cut, copy, and paste everything from video footage to animation and sound as easily as you work with text and graphics today.

Providing new, more far-reaching tools, System 7.1 comes with Apple's new WorldScript technology. It will support versions of System 7.1 in most

languages (writing systems, or alphabets), and will pave the way for your Macintosh to become a multilanguage personal computer.

Features

- Out-of-the-Box Power
  - New Finder simplifies working with folders, documents, and applications
  - Built-in file sharing with security features
  - Improved multitasking for working with several applications at once
  - Publish and Subscribe for automatic document updating across applications or networks
  - TrueType advanced font technology
  - New Font Folder provides a single location for all fonts, including TrueType, Adobe Type 1, and bitmapped fonts
  - Aliases for access to documents and applications from two or more locations
  - Virtual memory for running more applications without adding RAM

- Compatibility
  - Runs on any Macintosh computer with at least 2MB of RAM (4MB recommended)
  - Runs virtually all Macintosh applications

- Ease of Use
  - Simple, sure, one-step installation
  - "Learn as you work" Balloon Help

Product Details

- Finder
  The Finder displays all of the pull-down menus and icons needed to manage files, folders, disks, and applications in the Macintosh and over a network. It includes:

  - Apple menu with control panels, desk accessories, and other selected items
  - File menu
    - Locate files by name, date, size, label, or kind
    - Open applications, documents, and folders
    - Print documents and directories
    - Share folders with other users
    - Make an alias for an application, document, or folder
    - Get file information
  - Edit menu, to Cut, Copy, and Paste information
  - Views menu
    - View the contents of a Finder window by icon, name, size, kind, date, or label
    - View an outline of a folder's contents
  - Labels menu, to assign labels or colors to icons
  - Special menu
    - Clean up windows and desktop

    - Sort by icon, name, size, kind, date, or label
    - Erase the contents of disks
    - Restart and shut down the computer
  - Balloon Help menu, to display information about items on the screen
  - Application menu, to switch among open applications
  - Trash container, to discard files and folders

- Control Panels
  Control panels let you change many of the settings for the Macintosh, and include:

  - General controls for desktop patterns and color, time, and date
  - Startup device, to select the disk drive to be used for startup
  - Mouse, to set mouse speed and responsiveness
  - Keyboard, to set keyboard repeat rate and layout for international use
  - Monitors
    - Choose the number of colors/grays to display
    - Specify positions of multiple monitors
  - Color, to select highlight and window color
  - Memory, to increase system memory by using hard disk space, set the disk cache, and turn on 32-bit addressing
  - Labels, to customize labels in the Finder
  - Views, to customize icons and information
  - Sharing Setup, to identify the Macintosh to the network, start file sharing, and turn on program linking
  - Network, to specify network cabling system (LocalTalk, EtherTalk, or TokenTalk)
  - Users & Groups
    - Administer names and passwords of users who will have access to files and folders
  - Sound, to specify system alert sounds and volume levels
  - Date and Time, to customize formats for displaying dates and times
  - Numbers, to customize formats for display of numbers

Desk Accessories:

  - Chooser, to select printers, file servers, and other network resources
  - Key Caps, to display characters of different fonts
  - Alarm Clock/calendar
  - Four-function Calculator
  - Eight-page Note Pad for text
  - Scrapbook for storage of frequently used graphics and text

Built-in TrueType Fonts:

  - Times (plain, bold, italic, and bold italic), Helvetica (plain and bold), Palatino (plain, bold, italic, and bold italic), Symbol, Courier (plain and bold), Chicago, New York, Monaco, and Geneva

Utilities:

  - Apple File Exchange
  - Disk First Aid

- LaserWriter Font Utility
- TeachText
- Apple HD SC Setup

Software Extensions supports:

- QuickTime
- Macintosh PC Exchange
- AppleTalk Remote Access
- At Ease
- ColorSync
- Other system software extensions

Print drivers:

- ImageWriter
- LaserWriter
- Personal LaserWriter LS
- Personal LaserWriter SC
- ImageWriter LQ
- Apple StyleWriter
- AppleTalk ImageWriter
- AppleTalk ImageWriter LQ

System Requirements

A Macintosh personal computer with 2MB of RAM (4MB recommended for running multiple applications) and a hard drive

Ordering Information

System 7.1 Personal Upgrade Kit (M7200LL/A)*:

- System 7.1 software (six 1.4MB disks)
- "Before You Install" with Compatibility Checker 2.0 (one disk)
- QuickTime Extension and Scrapbook (one disk)
- Complete setup, learning, and reference documentation
- 1 year of toll-free upgrade assistance
- Limited warranty statement

*For System 6.0.X users.

System 7.1 MultiPack (up to 10 users) (M7201LL/A)*:

- System 7.1 CD-ROM disk with:
  - System 7.1 software
  - System 7.1 disk images (800K and 1.4MB)
  - "Before You Install" with Compatibility Checker 2.0 (one disk)
  - Networking Administrator Tools
- Floppy disks of all System 7.1 software (six 1.4MB disks)
- QuickTime Extension and Scrapbook (one disk)
- Complete setup, learning, and reference documentation

- System 7.1 Administrator's Handbook
- 1 year of toll-free upgrade assistance
- Limited warranty statement

*For System 6.0.X users or networked System 7.0 or 7.0.1 users.

System 7.1 Update Kit (M7202LL/A)*:

- All software and accessories included with System 7 Personal Upgrade Kit
- System 7.1 Update Guide

Apple IIe Card: Requires SW Ver. 2.2.1 with System 7.1 (7/94)

Revised: 7/6/94
Security: Everyone

Apple IIe Card: Requires SW Ver. 2.2.1 with System 7.1 (7/94)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 06 July 1994

TOPIC ----------

If I upgrade my Macintosh LC II with an Apple IIe Card to System 7.1, what version of software do I need for the Apple IIe Card?

DISCUSSION ----------

To use the Apple IIe Card on a Macintosh LC II, Macintosh LC III, or Performa 400 series running System 7.1 or System 7.1P, you need version 2.2.1 of the Apple IIe Card software. You should upgrade to version 2.2.1 ONLY if you are using System 7.1.

Any error listed “Error Type 1” through an “Error Type 4”, an error 10019, a “defective card error”, and/or a partial screen in the IIe mode are indicators of the incorrect version of the IIe Card software.

You can purchase a software upgrade kit to upgrade older Apple IIe card software.

Note

You can use the Apple IIe Card software version 2.2 with the original Macintosh LC, but it's not required.

Article Change History:
06 Jul 1994 - Reviewed for technical accuracy.
23 Nov 1993 - Revised to add current version of software.
12 Jul 1993 - Revised to add Macintosh Performa 400 series.

System 7.x: Improved Font Management (5/95)

Revised: 5/26/95
Security: Everyone

System 7.x: Improved Font Management (5/95)

==========

Article Created: 14 October 1992
Article Reviewed/Updated: 26 May 1995

TOPIC ----------

This article contains a series of questions and answers about fonts and font management with systems newer than System 7.0 and 7.0.1.

DISCUSSION ----------

Question: Do fonts work differently with System 7.1 and greater than they did with System 7.0 and 7.0.1?

Answer: No, fonts function the same as they did with System 7.0 and 7.0.1. However, they no longer reside in the System file. All fonts, including PostScript Type 1 fonts (which were stored in the Extensions folder under System 7.0 and 7.0.1), TrueType, and bitmapped fonts, as well as font suitcases, now reside in the new Font folder within the System Folder.

Question: When I upgrade to a system newer than System 7.0 or 7.0.1 (such as System 7.1 or System 7.5), what happens to the fonts installed in my System file?

Answer: The Installer copies your fonts to the new Font folder and stores each font family in a separate suitcase. Then the Installer removes those fonts from the System file. However, the Installer does not remove the Chicago, Geneva, or Monaco fonts from the System file, even though it has copied them to the Font folder. These three fonts must be present for the System to function properly. You can remove these fonts from the System file and the Fonts folder to save disk space, because the System retains an invisible set for its own use.

Question: What are the "Apple Classic Fonts"?

Anwer: These fonts, also known as the city fonts, came with the original

Macintosh computer in 1984. They are bitmapped fonts, and TrueType versions are not available from Apple.

Question: How are fonts installed?

Answer: Fonts are installed by dragging a font suitcase or font file to the System Folder. They are automatically placed in the Font folder.

Question: What is a font suitcase?
Answer: In System 7.0 and 7.1, a suitcase behaved exactly like a folder. A suitcase, on the other hand, can store only font files.

Question: What is a bitmapped font?

Answer: A bitmapped font is defined as a font with a specific point size and a resolution of 72 dots per inch. With System 7 and later, bitmapped fonts are used to display on-screen text in the specified point size. Bitmapped fonts cannot be scaled and are not designed for quality printed output.

Question: What is a TrueType font?

Answer: A TrueType font is a mathematical representation of a font that can be scaled to any size and displayed on-screen or printed to any printer.

Question: What is a PostScript (or printer) font?

Answer: A PostScript font is a mathematical representation of a font that is used by a PostScript printer to yield high-quality output. To be used, a PostScript font must be accompanied by a bitmapped version of the same font or the Adobe Type Manager (ATM) extension needs to be installed.

Question: How can I tell if a font is a PostScript, bitmapped, or TrueType font?

Answer: Fonts types have distinctive icons. PostScript fonts' icons vary, depending on the font designer. A bitmapped font's icon looks like a rectangle with the upper left corner folded over and a single letter "A" in the center of the rectangle. A TrueType font has a similar icon, except it shows three different sizes of the letter "A" that overlap in the rectangle. Also, the name of bitmapped fonts end with a number; TrueType fonts do not.

Question: If I have a TrueType version of a font, do I also need a bitmapped version of the same font?

Answer: No. The TrueType font is all you need to display the font on your screen and to print it at the highest possible resolution on your printer.

Question: Why does Apple include both bitmapped fonts and TrueType fonts if all I need is the TrueType version?

Answer: Having bitmapped fonts available increases the speed of screen redraws on the lower-end Macintosh computers.

Question: Is it better to keep my fonts in a suitcase or to put them into the Font folder as individual files?

Answer: The Font folder is limited to a total of 128 suitcase and font files (PostScript fonts are not included in the 128 file limit). Suitcases can hold an unlimited number of font files, as long as 16MB of disk space is not exceeded. By storing your fonts within a suitcase in the Font folder, you use less RAM, and the number of fonts is limited only by the size of the hard drive.

Question: How do I create a font suitcase?

Answer: You cannot create a font suitcase with System 7.1 or greater, but you can duplicate an existing suitcase. If you need an empty suitcase, duplicate an existing suitcase and trash its contents. You can duplicate the remaining suitcase as many times as you need.

Question: Can I merge suitcase files?

Answer: Yes, by dragging one suitcase file on top of another suitcase file.

Security: Everyone

System 7.1: Installation (5/96)

==========

Article Created: 12 October 1992
Article Reviewed/Updated: 21 May 1996

TOPIC ----------

This article takes you through all preparation, installation, and post-installation steps you should take to properly install system software version 7.1 on a Macintosh computer.

DISCUSSION ----------

Print and read the Read Me file, located on the Tidbits disk inside the Apple Utilities folder. This file contains current information on System 7.1. Also, system disks supplied with Macintosh computers come with an Install Me First disk. If you have this disk, follow the instructions on it.

If you do not have an Apple hard drive, or use third-party software to format your hard drive, verify that the formatting software is compatible with System 7.1. Contact the software developer.

System software version 7.1 requires a Macintosh computer with at least 2 MB of RAM (4 MB of RAM is strongly recommended), and a hard disk with at least 5 MB of disk space available.

You can install over System 6 or System 7, or on a hard drive that does not have a System Folder. The Installer cannot install on a hard drive with System 5 or earlier. If you have System 5 or earlier, it is important to follow the instructions for a clean installation. These instructions can be found in a related document titled "System 7.1 Clean Installation".

Back Up Your Hard Disk

Copy the data on your hard disk to another hard disk or to floppy disks. There are several software utilities available that perform this operation. Or you can select the items you want to copy, and then drag them to the disk where you want to copy them. If you cannot copy everything, at least copy your System

Folder to another disk.

Check Available Hard Disk Space

Be sure you have at least 5, 120K (5 MB) of disk space available on the hard drive where you plan to install the system software. To check disk space, follow these steps:

1) Choose Control Panels from the Apple menu.

2) Double-click the Views control panel to open it.

3) In the Views control panel, check "Show disk info in header".

4) Open your hard disk's window.

The amount of available disk space appears in the upper-right corner of any open window.

If there is less than 5,120K available, you will need to delete some unnecessary files by dragging them to the Trash. Choose Empty Trash from the Special menu and you will have more disk space available.

Check Compatibility

If you are upgrading from an earlier version of System 7 to 7.1, check the Software Compatibility list.

If you are upgrading from System 6, run Compatibility Checker 2.0. It is a stand-alone application that you run following these steps:

1) Copy the Compatibility Checker 2.0 application to your hard disk.

2) Double-click the Compatibility Checker icon to launch the application. The Introduction screen appears.

3) Click the continue button.

4) Click the OK button if you want Compatibility Checker to scan all of your hard disks. Otherwise, click the check boxes to deselect any hard disk you don't want scanned. A dialog box marks the scanning progress.

5) If Compatibility Checker finds potentially incompatible items, a window appears.

6) Click one of the two buttons at the bottom of the window. If you click the Move button, it moves the items to a folder on the hard disk named "May Not Work With System 7.1." In either case, Compatibility Checker's report window appears.

7) Use the Sections menu to navigate around the report. (It is best to print the report and use it as a guide to update your software if

necessary.)

8) When you are finished with Compatibility Checker, click the Quit button. A dialog box appears, asking if you want to save the report.

9) After you have made your choice, another dialog box appears if you previously moved items out of your System Folder.

10) Review the report, following the instructions detailed there. Vendors are the best source of information; please contact them directly if you have any questions.

Virus and Security Software

If you have installed virus protection or security software, you will need to remove them from the system. Follow removal instructions in the user manual provided with the software.

Run Disk First Aid

Disk First Aid can detect and repair problems that an Apple hard disk. Be sure you followed the instructions under "Virus and Security Software" before you begin.

1) Start up with the Disk Tools disk. To do this, turn on your Macintosh. If it is already on, select Restart from the Special menu.

2) Put the Disk Tools disk in the main floppy drive right after you hear the chime. The Disk Tools disk icon appears in the upper-right corner of the desktop.

   If it does not appear there, select Restart from the Special menu. The disk ejects -- push it back into the drive immediately.

3) Double-click the Disk First Aid icon, and make sure the startup disk is selected. If it is not, click the Drive button to select the startup hard disk.

4) Click on Open and then on Start. Disk First Aid will check your hard disk for any potential problems. If it finds problems, you should let the software repair them.

5) Repeat this procedure for each hard disk attached to the system.

6) When you are finished verifying the hard disks, choose Quit from the File menu to return to the desktop.

If Disk First Aid cannot repair a hard disk, you should back up the hard disk and reinitialize it using the appropriate formatting utility for that drive. For Apple drives, use Apple HD SC Setup.

Update Hard Disk Drivers

Drivers are small pieces of software that tell your hard disk how to interact with your Macintosh computer. You must update these drivers on an Apple hard disk before installing System 7.0 or higher. (Please note: if you already have an earlier version of System 7, you do not need to upgrade your drivers.)

If you don't have an Apple hard disk or use third-party software to format your disk, do not use the Apple HD SC Setup utility. However, you should contact your hard disk vendor to verify that your formatting software is compatible with system software version 7.1.

If you have an Apple hard drive, you should update the drivers with the version of Apple HD SC Setup that's on the Disk Tools disk.

1) Follow the instructions numbered 1 and 2 in the "Run Disk First Aid" section to start up your Macintosh with the Disk Tools disk.

2) Double-click the Apple HD SC Setup icon.

3) Click the Update button in the dialog box that appears. If the update is successful, it will display the message "Driver Update Successfully Completed."

   (NOTE: If the Update button is dimmed, no update is required or a third-party utility was used to format the hard disk.)

4) Click the Quit button.

Install System 7.1

System 7.1 software consists of either:

- A set of nine 800K disks: Disk Tools, Install, Install 2, Install 3, Printing, Fonts, Fonts 2, Tidbits, and Tidbits 2, or

- A set of six 1.44 MB (High Density or FDHD) disks: Disk Tools, Install, Install 2, Printing, Fonts, and Tidbits.

1) If you are installing from 1.44 MB disks, start your Macintosh computer. If it is already on, select Restart from the Special menu. Put the Install disk in the main floppy drive right after you hear the chime.

   If you are installing from 800K disks, start up from the Disk Tools disk. Then eject the Disk Tools disk and insert the Install disk. Since the 800K Install disk doesn't contain a System file, you cannot use it as a startup disk. You will have to swap between the Disk Tools and Install disks 4 to 6 times before the Installer begins.

   A welcome message appears.

2) Click the OK button. The Easy Install window appears. At this point you have two options:

- Easy Install, which installs the Macintosh system software and printer software recommended for your computer, or

- Customize Install, which lets you override the recommended software and choose the software you want installed.

Note For Macintosh Quadra, PowerBook, and LC Users: When installing System 7.1 on the Quadra 700, 900, and 950; Macintosh LC and LCII; and PowerBooks 100, 140, and 170, use the Easy Install option, or choose "System software for any Macintosh" in the Custom Install window. Do not use Custom Install for other software choices -- the Monitors control panel will not install properly if you use this option.

Easy Install
---

1) Click the Switch Disk button to select the disk you want to install with system software.

2) Click the Install button to do the Easy Install.

3) Follow the instructions on the screen. Messages appear, prompting you for the proper disks. When installation finishes, a dialog box appears.

4) Click the Quit Button.

5) Select Restart from the Special menu.

Customize Install
---

1) Click the Customize button.

2) When a window appears, click the Switch Disk button to select the disk you want to install with system software.

3) Select the items you want to install. Press the Shift key, and click to select multiple items. Your selections appear beneath the scrolling window.

4) When you have made your selections, click the Install button. Messages appear, prompting you for the proper disks. You will see a message telling you that installation is complete.

5) Click the Quit button.

Net Install

If someone has previously set it up, you can install System 7.1 over a network:

1) Connect to the shared disk that contains the Net Install folder.

2) Open the Net Install folder.

3) Double-click the Installer icon.

4) Follow the instructions under "Easy Install" or "Customize Install," which appear earlier in this document.

If Installation Fails

If a normal installation fails, you need to do a "clean" system software installation. If you want to use the fonts installed in your old system file, you'll have to temporarily remove them:

- If you are currently using system software version 7.0 or 7.0.1, double-click the System file and remove any needed fonts or sounds from the System file.

- With versions of System 6, use Font/DA Mover to save fonts and desk accessories to a font suitcase.

Start up with the Disk Tools disk. To do this, shut down the Macintosh, insert the Disk Tools disk into the floppy drive, then startup your Macintosh.

If the computer ejects the Disk Tools disk and will not start up from it, be sure you have an Apple SuperDrive (formerly called FDHD). If your computer does not have a SuperDrive, you need 800K disks. Call the Apple Order Center to get them.

If you already have 800K disks, and your computer will not start up from the Disk Tools disk, you may have a computer that will not start up from System 6. Boot from the Disk Tools disk that shipped with your Macintosh and follow the instructions in a related document titled "System 7.1 Clean Installation". A clean system installation will create a completely new System Folder on the hard disk. This new System Folder will have fresh copies of all the system components.

After Installation is Complete

If you want to use the fonts and desk accessories that were installed in your old System file, drag the font files to the new System Folder on your hard drive. The system will automatically place the fonts into the Font folder. Drag the desk accessories to the Apple Menu Items folder.

If you installed any software that modified your old System file, you need to reinstall that software after you install System 7.1. Delete the old System file from the desktop. The Installer program doesn't install QuickTime 1.5 automatically. Use the QuickTime disk to install the QuickTime extension.

If you need to create an empty suitcase, duplicate an existing suitcase. Drag the contents of the duplicated suitcase to the Trash. You can duplicate the remaining suitcase whenever you need one.

System 7.1: Use MacTCP 1.1.1 or Later (7/94)

Revised: 7/21/94
Security: Everyone

System 7.1: Use MacTCP 1.1.1 or Later (7/94)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 21 July 1994

TOPIC ----------

I upgraded from System 7.0 to 7.1. Virtual memory worked fine in the past. But now, after enabling Virtual Memory, the system bombs on restart with an error message that the System File is damaged, and to use the Installer to fix it. Reinstalling doesn't help, but turning Virtual Memory off lets the system boot normally.

The README file with System 7.1 says that I must upgrade to MacTCP 1.1.1. How do I get MacTCP 1.1.1?

DISCUSSION ----------

The system file isn't really damaged. MacTCP 1.1 will cause this message to appear if it's installed. MacTCP isn't fully compatible with System 7.1, and you should upgrade to version 1.1.1 or later.

If you have MacTCP 1.1 or earlier installed on your Macintosh, remove it from your System Folder before you upgrade to System 7.1. The system will crash when you start up if you don't do this.

Which Version of MacTCP should I use?

Both MacTCP 1.1.1 and later are compatible with System 7.1.

MacTCP 1.1.1 and later versions offer better support for larger "Hosts" files and for extension products, such as:

- AppleTalk Remote Access (ARA)
- Serial Line IP (SLIP)
- Point-to-Point Protocol drivers (PPP)

As of November 1993, the current version of MacTCP is 2.0.4.

Changes to the Distribution and Update Process

With the release of MacTCP 1.1.1 and later versions, there are some changes in the distribution and update process. Depending on how you obtained earlier versions, the method of obtaining new versions varies:

- Current MacTCP site license users receive the MacTCP 1.1.1 update free of charge. Developers with MacTCP commercial distribution licenses and customers with MacTCP internal use licenses have been sent updates. Developers or customers with these licenses, who haven't yet received their update, should contact Apple Software Licensing.

- Purchasers of the single user license of MacTCP 1.1 from APDA can obtain the MacTCP Developer Upgrade Kit (R0446LL/A) for a fee from APDA. The upgrade kit is only for MacTCP 1.1 customers who don't presently have a MacTCP commercial distribution license or internal site license.

- Customers who received MacTCP as part of MacX will be updated through MacX 1.2 update programs. You can order the MacX 1.2 update see your local dealer. This upgrade is for MacX 1.0, 1.1, or 1.1.7 and A/UX customers. Proof of purchase is required.

- MacTCP 2.0.2 is available on the price list as TCP/IP Connection for the Macintosh, or TCP/IP Administration for the Macintosh.

- MacTCP 2.0.4 is an update in a patch to update MacTCP 2.0.2.

- Purchasers of a commercial retail product that included MacTCP should contact the product's developer for details of any updates they may offer.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Article Change History:
21 Jul 1994 - Changed current version to MacTCP 2.0.4.
10 May 1994 - Removed reference to Apple Catalog.
01 Oct 1993 - Added symptom of using MacTCP 1.1 and System 7.1, and MacTCP 2.0.2 availability information.
23 Sep 1993 - Added MacTCP 2.0 information.
09 Dec 1992 - Revised, added availability information.

System 7.1: Get Info Window Change

Revised: 10/14/92
Security: Everyone

System 7.1: "Get Info" Window Change

==========

Article Created: 19 October 1992

TOPIC ----------

This article explains the change to the "Get Info" window in the File menu.

DISCUSSION ----------

The "Get Info" window in the File menu has been changed with System 7.1 to improve memory management.

There are now three "Memory" fields:

- Suggested Size (Constant)
- Minimum Size (Changeable)
- Preferred Size (Changeable)

When an application is launched, it will try to open with the Preferred Size. If that amount of memory is not available, the application will try to open with (at least) the Minimum Size.

Each application has a minimum memory requirement written in the program. The Minimum Size field can be set below this number; however, the system will warn the user that the application may crash at this setting.

System 7.1: Ordering Information (5/96)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 24 May 1996

TOPIC ----------

This article provides ordering information for System 7.1 Upgrade Kits.

DISCUSSION ----------

System 7.1 is available in three kits.

For Users Upgrading from System 6.0.X

- The System 7.1 Personal Upgrade Kit (M7200LL/A) contains the software you need to upgrade from System 6.0.X to System 7.1 on a single Macintosh.

- The System 7.1 MultiPack (M7201LL/A) contains the software you need to upgrade from System 6.0.X to System 7.1 for up to 10 Macintosh computers.

The MultiPack provides a set of system enablers. The Personal Upgrade Kit and MultiPack Kit come with a new Compatibility Checker that doesn't require the HyperCard application.

The Personal Upgrade kit and the MultiPack are available through your local dealer.

For Users Upgrading from System 7.0 or 7.0.1

- The 7.1 Update Kit (M7201LL/A) contains the software yo@o upgrade from System 7.0 or 7.0.1 to System 7.1 on a single Macintosh.

You can order the 7.1 Update Kit by calling the Apple Order Center. The Tech Info Library article titled "Locating Vendor Information" can help you search for Apple Order Center's phone number.

Telephone Support

When you buy any System 7.1 kit, you get 1 year of telephone support.

For details of what is included in each kit, see Tech Info Library article "System 7.1: General Description."

System 7.1: Special Note for Installing on a Quadra

Revised: 10/14/92
Security: Everyone

System 7.1: Special Note for Installing on a Quadra

==========

Article Created: 19 October 1992

TOPIC ----------

This article gives special instructions for installing System 7.1 on a Macintosh Quadra 700, 900, or 950.

DISCUSSION ----------

When installing System 7.1 on a Macintosh Quadra, use the Installer's Easy Install option or choose "System software for any Macintosh" in the Custom Install window.

Do not choose the "Macintosh Quadra" option in the Custom Install window, because parts of the Monitors control panel will not install properly.

System 7.1: System Enablers Described (7/93)

Revised: 7/16/93
Security: Everyone

System 7.1: System Enablers Described (7/93)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 6 July 1993

TOPIC ----------

System enablers are software modules, each specific to a given CPU (hardware model). A system enabler overrides system resources at startup to allow existing system software to support new Macintosh models. This mechanism eliminates the need to release CPU-specific system software each time a new Macintosh model is released. System Enablers are located at the top level of the System Folder -- not in the Extensions folder.

The System 7.1 base system has built-in support for all Macintosh models that shipped before the release of System 7.1 (from the Macintosh Plus through the Macintosh Quadra 950 and PowerBook 145). All new Macintosh models shipping after the release of System 7.1 will include System Enabler software specific for that model or a particular family of models, like the Macintosh PowerBook family.

This article describes System Enablers in more detail.

DISCUSSION ----------

New CPUs No Longer Require New System Releases

System enablers (which were called "gibblies" in early documentation and system development releases) replace the release strategy that Apple used in the past for minor system changes needed for new hardware. The old strategy was to release a new version of the system software, such as version 6.0.8 or 7.0.1. With enablers, the differences in hardware no longer require a new system release, but instead each new computer has its own enabler (if necessary) to make the system work for that hardware.

This change was made for two reasons:

• Creating an enabler instead of a whole new system release reduces Apple's

quality assurance and testing time. By creating an enabler, we're testing new code only on new computers. Past computers aren't affected since the new enabler won't run on those computers. This also reduces third-party testing time, since they will no longer have to install a new system release on all older computers and test for compatibility.

- Enablers reduce user confusion and unnecessary upgrades. In the past, every time a computer was released, with its corresponding new software release, users of older computers were unsure if they needed to upgrade to the new system. Many assumed that since it was newer, it was better. This usually wasn't the case. For instance, upgrading from 7.0 to 7.0.1 on a Macintosh IIcx, gives you nothing new.

Apple will continue to use system extensions or components to add new functionality across the product line, as with QuickTime and Macintosh Easy Open.

Some General Rules About Their Behavior

System enablers are system software, designed and intended solely for the use of Apple Computer. Their functionality and implementation will change. An enabler is essentially an extension to the System file; from a programmatic standpoint it is the System file.

The Resource Manager was changed slightly to recognize references to the System file (CurResFile(0), for example) as being references to the System file and the current enabler. The code or other resources included in the enabler file appear to actually reside in the System file.

If there are multiple enablers in a computer's System Folder, the system will use only one of them. The system software (System file plus enabler) is responsible for arbitrating which enabler is used on a specific computer. It looks at the computer type it's currently running on, the computers that the enabler supports, and some enabler-internal applicability flags. Note that this is how the decision is currently made; as enablers are used for more computers and in different situations, more variables may be added to the decision process.

Enablers and Reference Releases

A specific enabler may not stay around forever. Apple has announced its intention to have "reference releases" every year to 18 months. These are the system upgrades that all users will be encouraged to install. Some enablers may be rolled into a reference release, so a computer that needed an enabler for System 7.1 may not need one for System 8. This isn't a hard and fast rule; some enablers may stay around forever, depending on the functionality they enable.

System 7 and System 7.1: System Requirements (9/93)

Revised: 9/23/93
Security: Everyone

System 7 and System 7.1: System Requirements (9/93)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 23 September 1993

TOPIC ----------

This article discusses System 7 and System 7.1 system requirements.

DISCUSSION ----------

System 7 and System 7.1 run on all Macintosh Plus and later Macintosh models that have 2MB RAM and a hard drive -- though some features are not available on all models.

The minimum RAM requirement for System 7 and 7.1 is 2MB. However, Apple is encouraging customers to use at least 4MB for running multiple applications and to accommodate many of the popular Macintosh applications that individually require 1MB or more of RAM to run.

In addition, if you have a 68030 microprocessor or a 68020 microprocessor with a Paged Memory Management Unit (PMMU) installed, you can use the Virtual Memory feature.

Printing

System 7 and System 7.1 are compatible with all printers that work under previous versions of the Macintosh operating system. Networked Macintosh computers running System 7 or System 7.1 can share laser printers with Macintosh computers running System 6.0.X, running the proper LaserWriter driver.

- With System 7, use LaserWriter Driver 7.0 or later. (Note: Apple recommends that System 7.0 & 7.0.1 users install System 7 Tune-Up, which will install LaserWriter Driver 7.1.1.)

- With System 7.1, use LaserWriter Driver 7.1.2 or later.

Notes:

- LaserWriter Driver 7.0 and 7.1.2 are completely compatible with System 6.0.X.

- LaserWriter Driver 8.0 is compatible with System 6.0.7 and higher.

- It is not possible, however, to run a System 7 LaserWriter driver and earlier LaserWriter drivers on the same Macintosh.

- It is possible to have both LaserWriter Driver 7.x and LaserWriter 8.0 on the same Macintosh, as they do not conflict with each other.

Article Change History:
23 September 1993 - Added additional LaserWriter 7.x and 8.0 information.

System 7.1: What's New?

Revised: 10/14/92
Security: Everyone

System 7.1: What's New?

==========

Article Created: 19 October 1992

TOPIC -----

What does System 7.1 offer that's different from System 7.0 or 7.0.1?

DISCUSSION -----

System 7.1 includes:

- WorldScript software, which simplifies support of language scripts in Macintosh system software.
- Several new control panels to allow users to customize the formats for dates, times, numbers, and text behavior -- sort and case conversion, for example.
- Improvements made by System 7 Tune-Up 1.1.1.
- The QuickTime software extension that provides multimedia capability for your Macintosh.
- The new Font folder within the System Folder for a single place to store all fonts.
- System Enablers that provide compatibility between Macintosh CPU hardware and system software. Compatibility is achieved by adding a software module, not by reinstalling a new system.

System 7.1: Who Should Upgrade?

Revised: 10/14/92
Security: Everyone

System 7.1: Who Should Upgrade?

==========

Article Created: 19 October 1992

TOPIC -----

Does Apple recommend that every Macintosh user upgrade to System 7.1?

DISCUSSION -----

Apple recommends upgrading to System 7.1 if you are currently running System 6.0.X, or if you are running System 7.0 or 7.0.1 and want WorldScript functionality.

System 6.0.X users get:

- The benefits of System 7 (built-in TrueType, file sharing, Publish and Subscribe, improved Finder, multitasking, Balloon Help, and so on).
- The ability to use At Ease and future system extensions based on System 7.1.
- Improved support for two-byte languages (alphabets) and fonts, like Japanese, Chinese, and Korean.

Current System 7 users get:

- Improved font handling with the new Font folder.
- Improved stability with the integration of System 7 Tune-Up 1.1.1 and other fixes.
- Improved mechanism to support future Macintosh models with System Enablers.

System 7.1: WorldScript Technology (1/94)

Revised: 1/26/94
Security: Everyone

System 7.1: WorldScript Technology (1/94)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 26 January 1994

TOPIC ----------

This article describes Apple's WorldScript technology.

DISCUSSION ----------

Overview

WorldScript is a system-level technology that provides support for most languages (alphabets, or writing systems) worldwide, including support to handle the complexities of non-Roman alphabets. This technology includes system-level support of both one-byte languages, like Arabic and Hebrew, and two-byte languages, like Japanese, Chinese, and Korean. (Two-byte languages are those with more than 256 characters.)

WorldScript allows multiple languages to coexist on the same system for users to write in multiple languages.

By integrating this technology into the Macintosh operating system, System 7.1 allows the Macintosh computer to be quickly localized for any language. WorldScript I and WorldScript II are system extensions that eliminate the need for separate extensions for each script. The consolidation of all the scripts into these two extensions provides these benefits:

- Consistent behavior across scripts
- Reduced space requirements for multiple script systems
- Easier maintenance and testing

Script-specific resources, such as keyboard layout and fonts must be provided for each specific script. In addition, Traditional and Simplified Chinese, Japanese and Korean require an input method to map the keystrokes to their large character set.

How WorldScript Differs from Previous Scripting Implementations

Prior to System 7.1, all script systems were developed independently, usually in the countries where they were used. Each script system contained code that handled its own language. This code was updated and tested with each system software release.

Now there are two scripts that consolidate script systems:

- WorldScript I is for non-Roman, single-byte languages, like Arabic, Thai, and Hebrew. It handles right-to-left languages and special character formats.

- WorldScript II is for non-Roman double-byte languages, like Japanese, Chinese, and Korean, and provides support for fonts sets with a large number of characters, special methods of text input, and multi-directional text. There are also extensions to provide compatibility with System 6 fonts, Japanese input methods, and a new Text Services Manager.

InputBackSupport is an extension created to support Japanese fonts already in use that aren't TrueType fonts. It also provides backwards compatibility with Japanese 6.x input methods.

The Text Services Manager manages, catalogs, and provides access to software modules that provide a service for inputting text. It's especially useful for script systems like Japanese, Chinese, and Korean that have complicated text input. It provides a database service for applications to search for input methods, find information about the methods, and communicate directly with those services.

Installation

In addition to WorldScript I and II, you'll need language-specific extensions in your System Folder to view and create documents in other languages. The script bundle contains all of the files needed to support a single language. To install a specific language, you need to drag the script bundle, at least one font from that script, and the WorldScript extension onto the System Folder icon. These script bundles are not yet available.

If you have WorldScript installed along with the necessary language extensions and fonts, you'll see a Keyboards menu icon in the Finder between the Application and Balloon Help menus. To see this menu, you must have the proper software installed, as described in the previous paragraph, and you must have an application launched that supports multiple scripts within a single document.

Control Panels

Several new control panels are included with System 7.1 that let users customize the formats for dates, times, numbers, and text behaviors, like sort order and case conversion. The Text Control Panel is required with WorldScript I and II. For detailed information on the new System

7.1 control panels, see Tech Info Library article "System 7.1: New Control Panels."

WorldScript Availability

As of 26 January 1994, the following Apple products incorporating WorldScript and language extensions are available:

- Japanese Language Kit
  - Inside the USA, order product number M1648LL/A
  - Outside the USA, order product number M1648Z/A
- Chinese Language Kit
  - Inside the USA, order product number M2368LL/A
  - Outside the USA, order product number M2368Z/A

Note

WorldScript does not include support for Unicode; however, it provides an ideal platform for future Unicode support.

For more information on the script system, see the APDA documents "Worldwide Development: Guide to System Software" and "Guide to Macintosh Software Localization."

Article Change History:

Macintosh Color Display: Specifications (8/94)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 3 August 1994

TOPIC ----------

This article gives technical specifications for the Macintosh Color Display.

DISCUSSION ----------

Picture Tube

• 14-inch diagonal, 13-inch viewable Trinitron CRT
•.26mm aperture grill pitch
• High-contrast glass

Input Signals

• Red, green, and blue video signals
• Composite sync., negative going TTL

User Controls

• Power switch
• Brightness, with detent reference
• Contrast
• V-twist misconvergence adjustment
• H-stat misconvergence adjustment

Scanning Frequencies

• Horizontal: 35.0 kHz
• Vertical: 66.7 Hz

Video

• Resolution: 640 horizontal pixels by 480 vertical lines

- Active display area: Adjusted at the factory to produce an active video area of 235 mm (9.3 inches) horizontal by 176 mm (6.9 inches) vertical. The remainder of the screen is used for the dark border around the display.
- 70 dots per inch

Size and Weight

- Weight: 24 lb. 14 oz. (11.3 kg)
- Height: 13 inches (33 cm)
- Width: 13.4 inches (34.0 cm)
- Depth: 14.0 inches (35.6 cm)

Input Electrical Requirements

- Voltage: 90 to 270 Vrms
- Power: 37 W normal operation, 55 W maximum
- Frequency: 47-63 Hz

Environmental Requirements

- Ambient operating temperature: 10° C to 40° C (50° F to 95° F)
- Operating humidity: 90% maximum, non-condensing
- Operating altitude: 10,000 feet maximum

Fuse Protection

- The monitor contains internal power line fuse protection. This fuse should be replaced with the same type by a qualified service technician.

Warm-up Time

- 20 minutes to meet all specifications

Safety Information

- Meets SWEDAC recommendations for ELF and VLF magnetic and electric emissions.

System Requirements

- A modular Macintosh computer with on-board video support, such as a Macintosh LC II or Macintosh IIvx personal computer, or any NuBus-capable modular Macintosh that requires a video card (the Macintosh II, IIx, IIcx or IIfx).

- Video cards supported include:
- Macintosh II Video Card
- Macintosh II Hi-Resolution Video Card
- Macintosh II Extended Hi-Resolution Video Card
- Macintosh Display Card 4•8
- Macintosh Display Card 8•24

- Macintosh Display Card 8•24 GC

Article Change History:
09 Sep 1992 - Revised to include expanded system requirements.
21 Oct 1992 - Revised to include measurement information.
03 Aug 1994 - Revised to add safety information.

AppleCD 300 and 300i CD-ROM Drives: General Description

Revised: 8/19/96
Security: Everyone

AppleCD 300 and 300i CD-ROM Drives: General Description

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 19 August 1996

TOPIC ----------

This article provides a general description of the AppleCD 300 (external) and AppleCD 300i (internal) CD-ROM drives.

DISCUSSION ----------

Overview

The new high-performance AppleCD 300 drive is the perfect tool for accessing the world of CD-ROM and multimedia.

Designed for use with the Apple Macintosh personal computer, the AppleCD 300 spins at twice the speed of ordinary CD-ROM drives to give you much faster access to the tremendous amount of information stored on CD-ROM discs. So it's easier than ever to work efficiently with the wealth of commercially available reference libraries, software, databases, clip art/graphics collections, educational programs, and games. In addition, the faster spin speed of the AppleCD 300 means smoother playback of your QuickTime movies, video, and animation.

But the AppleCD 300 is not just a faster drive, it's also a far more versatile one. With the support of QuickTime, for instance, it can read the new multisession Kodak Photo CD discs. Take your original film, negatives, or slides to designated Kodak centers for conversion into high-quality images onto a Kodak Photo CD disc. Then -- because the AppleCD 300 can conveniently access Kodak Photo CD images -- you can cut and paste them into your favorite word-processing, presentation, and graphics applications.

To give you access to the diverse library of CD-ROM titles, the AppleCD 300 is compatible with the industry-standard ISO 9660/High Sierra file formats, as well as with the Macintosh HFS. It is CD-ROM XA-ready and also supports

other CD-ROM formats, such as CD+G and CD+MIDI. It not only plays standard audio CDs, but can also transfer CD digital audio data via the SCSI bus to your Macintosh for further editing.

Performance

- Operates at twice the speed of ordinary CD-ROM drives
- Double-speed (300KB/sec) data transfer rate
- Average access time of 295 ms (in double-speed mode)
- 256KB buffer for faster data transfer

Compatibility

- Fully compatible with Macintosh operating system software, including System 7 and QuickTime
- Compatible with ISO 9660/High Sierra and Macintosh HFS formats
- Supports multiple CD-ROM formats, including CD-ROM XA, multisession Photo CD, CD+G, CD+MIDI
- Plays standard audio CDs
- CD digital audio data via SCSI

Ease of Use

- Set up and use in minutes -- plug-and-play
- Easy, cost-effective network access
- Speed Select Switch software for choosing single- or double-speed operation

Reliability

- Automatic lens cleaning and double front-loading door for better dust protection

Ordering Information

AppleCD 300 (external) (M2710LL/A) includes:

- AppleCD 300 Drive
- CD caddy
- Installation disk
- QuickTime disk
- CD-ROM disc collection
- Power cord
- Complete setup, learning, and reference documentation
- Limited warranty statement

AppleCD 300i (internal) (M1903LL/A) is the mechanism for the Upgrade Kits listed below.

Upgrade Kits include:

- CD 300i mechanism (M1903LL/A)
- CD Setup disk
- QuickTime disk
- CD caddy
- User's Guide
- The appropriate brackets and bezels for installation.

AppleCD 300i Upgrade Kits

B1332LL/A AppleCD 300i Internal Drive Kit - Centris/Quadra 610 & 660AV
B1329LL/A AppleCD 300i Internal Drive Kit - Centris/Quadra 650 & IIvx
B1328LL/A AppleCD 300i Internal Drive Kit - Quadra 900 & 950
B1330LL/A AppleCD 300i Internal Drive Kit - Quadra 800 & 840AV

Cables and Accessories

- AppleCD Caddy (box of 5) (M2705)

- Apple SCSI System Cable (M0206)

- Apple SCSI Cable Terminator (M0332LL/A)

- Apple SCSI Peripheral Interface Cable (M0207)

- Apple SCSI Cable Extender (M0208)

Article Change History:
19 Aug 1996 - Corrected misspelling.
02 Nov 1993 - Added 300i Upgrade Kit information

AppleCD 300 (External) Drive: Specifications (Discontinued)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 19 August 1996

TOPIC ----------

This article provides specifications for the AppleCD 300 external CD-ROM drive.

DISCUSSION ----------

Playback Medium

- 12 cm optical disc installed in a CD caddy (any CD-ROM or audio compact disc is compatible)

Capacity

- Mode 1: 656MB
- Mode 2: 748MB
- Recording surfaces: 1
- Data/block (available to user):
  - Mode 1: 2048 bytes
  - Mode 2: 2336 bytes
- Blocks per disc: more than 270,000

Audio Playback

- Playing time: more than 1 hour
- Frequency response: 20 to 20,000 Hz

Characteristics

- Rotational Speed:
  - Normal speed (1X): 230 to 530 rpm
  - Double speed (2X): 460 to 1060 rpm

- Average Access Time:
  - Normal speed (1X): 360 ms
  - Double speed (2X): 295 ms

- Data Streaming Rate, Normal Speed (1X)
  - Mode 1: 150KB/sec
  - Mode 2: 171KB/sec

- Data Streaming Rate, Double Speed (2X)
  - Mode 1: 300KB/sec
  - Mode 2: 342KB/sec

- Block Rate:
  - Normal speed (1X): 75 blocks/sec
  - Double speed (2X): 150 blocks/sec

- SCSI Bus Transfer Burst Rate (over one CD-ROM block): 2.5MB/sec

- Buffer Size: 256KB

Formats Supported

- Multisession Kodak Photo CD
  (QuickTime required)
- ISO 9660/High Sierra
- Macintosh HFS
- CD-ROM XA (requires additional ADPCM hardware to read compressed audio)
- CD+G
- CD+MIDI
- Standard Audio CDs
- CD Digital Audio Data Via SCSI Bus

Interfaces

- One Headphone Jack (front panel)
- Two SCSI 50-Pin Connectors (for connection to the Macintosh and other
  SCSI devices) (rear panel)
- Two RCA Audio Output Jacks (for external amplifier or amplified speakers)
  (rear panel)

Electrical Requirements

- Power Requirements:
  - External: 100 to 240 V AC, 50/60 Hz
  - Internal: +5 V DC +/-5%,12 V DC +/-10%

- Power Consumption:
  - External: 0.28A AC (drive on)

  • Internal: 350 mA maximum for +5 V and 750 mA average,
    1.5A peak for +12 V

Operating Environment

• Temperature:
  • External: 41° F to 104° F (5° C to 40° C)
  • Internal: 41° F to 122° F (5° C to 50° C)

• Relative Humidity: 5% to 90% noncondensing

Non-operating Environment

• Storage Temperature (6 months): -22° F to 122° F (-30° C to 50° C)

• Transportation Temperature (72 hours): -40° F to 149° F (-40° C to 65° C)

• Relative Humidity: 5% to 95% noncondensing

System Requirements

• Macintosh SE or later model Macintosh personal computer

• Macintosh system software version 6.0.7 or later

• Depending on configuration, a separate SCSI system or peripheral cable
  (not included) is required

Size and Weight

• Height: 1.96 in. (5.0 cm)
• Width: 7 in. (17.75 cm)
• Depth: 13.1 in. (33.4 cm)
• Weight: 6.29 lb. (2.85 kg)

Article Change History:
19 Aug 1996 - Corrected misspelling.

PowerBook Duo 210: Description (Discontinued)

==========

Article Created: October 19, 1992
Article Reviewed/Updated: 14 March 1995

TOPIC ----------

This article describes the Macintosh PowerBook Duo 210 notebook computer.

DISCUSSION ----------

Overview

The Apple Macintosh PowerBook Duo 210 offers high performance in a 4-pound package that you can take anywhere and can become part of a complete desktop Macintosh system when you bring it back to your desk. It includes a CPU, full-size 16-gray-level supertwist display, keyboard and trackball, battery, and disk storage.

The PowerBook Duo 210 can be transformed into a desktop Macintosh by attaching it to an optional Duo Dock or MiniDock. You can then work with a large color display, full-size keyboard, printers, and network servers.

PowerBook Duo 210 Features

• Processor: 25-MHz 68030 microprocessor

• Memory: 4MB RAM, expandable to 24MB

• Weight: 4.2 lb. (1.9 kg)

• Expansion: Docking connector, connectors for internal modem and RAM

• Display: Backlit Supertwist, 16-level gray scale, 640 by 400 pixels

• Battery: Nickel hydride batteries for approximately 2 to 4.5 hours of use

• System software: System 7.1, with multitasking, file sharing, Balloon

Help, and TrueType fonts

- Networking: Built-in AppleTalk networking, file sharing without a dedicated server

- Compatibility: Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

Article Change History:
14 Mar 1995 - Corrected wording of MiniDock.

PowerBook Duo 210: Specifications (Discontinued 10/93)

==========

Article Created: October 19, 1992
Article Reviewed/Updated: 02 June 1993

TOPIC ----------

This article provides the technical specifications for the Macintosh PowerBook Duo 210 computer.

DISCUSSION ----------

Microprocessor

• 68030, running at 25 MHz

Address and Data Bus

32-bit Address Bus
32-bit Data Bus

Memory

• Comes with 4MB low-power DRAM on the logic board.

• Expands to up to 24MB of RAM by installing Macintosh PowerBook Duo 4MB or 8MB Memory Expansion Kits or larger-capacity third-party memory expansion cards in the expansion slots.

Disk storage

• One internal 80MB hard disk with 19 ms access time.

Display

• 9 in. (229 mm) diagonal

- Bright backlit Supertwist liquid crystal display

- 16-level gray scale, 640 by 400 pixels

Battery

- Nickel hydride, provides approximately 2 to 4.5 hours of use before recharging is necessary.

- Recharge time: about 2 hrs. recharged standalone in computer.

Keyboard

- Built-in keyboard with standard Macintosh layout.

- Two-level tilt adjustment.

- LED shows when caps lock key is engaged.

Trackball

- 19-mm-diameter, dual-button trackball.

Interfaces

- One 152-pin PDS connector for attaching a Macintosh Duo Dock, Macintosh Duo MiniDock, Macintosh PowerBook Duo Floppy Adapter, or other expansion devices.

- One RS-422 serial port for printer, modem, or other serial device.

- One RJ-11 Port for optional internal modem.

- One power adapter port.

File Transfer Options

- LocalTalk cables and System 7 file sharing.

- Serial cable and System 7 file sharing.

- Fax/data modem and AppleTalk Remote Access software.

- With Duo MiniDock: External Apple SuperDrive, SCSI Disk Adapter, and HDI-30 SCSI System Cable for external hard drives.

- With Duo Dock: Internal Apple SuperDrive, optional internal hard drive, and HDI-30 SCSI System Cable for external hard drive.

Modem

- Optional internal Macintosh PowerBook Express modem. 14,400 bits per second (bps) data, with fax send and receive at 9600 bps; includes Express

Fax software:
- Hardware supports V.32bis, CCITT, and Bell standards.
- Software supports CCITT standard V.42 and V.42bis (for up to 57,000 bps effective throughput), MNP 2-5.
- Supports standard Hayes AT command set.

Microphone (built-in)

- Internal electret, omnidirectional.

Sound

- Built-in speaker.

- Monophonic 8-bit sound, capable of supplying the same signal to both channels of stereo headphones or other stereo equipment through the sound jack.

- 8-bit sound output, sampled at 11 or 22 kHz.

Disability access

CloseView, Easy Access, and visible beep are included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disabilities.

Size and weight

- Height: 8.5 in. (21.6 cm)

- Width: 10.9 in. (27.7 cm)

- Thickness: 1.4 in. (3.6 cm)

- Weight: 4.2 lb. (1.9 kg)

Electrical requirements

- Line voltage: 100 to 240 V

- Frequency: 50 to 60 Hz

Environmental requirements

- Operating temperature: 50° F to 104° F (10° C to 40° C)

- Storage Temperature: -40 to 65° C (-40 to 148° F)

- Relative humidity: 20% to 95% noncondensing

- Altitude: 0 to 15,000 ft. (0 to 4722 m)

- Operating altitude: 0 to 10,000 ft.(0 to 3048 m)

Article Change History:

06/02/93 - Updated to correct voltage specification.
02/19/93 - Updated to correct storage temperature range.

DISCUSSION ----------

Microprocessor

• 68030, running at 33 MHz.

Address and Data Bus

32-bit Address Bus
32-bit Data Bus

Memory

• Comes with 4MB low-power DRAM on the logic board.

• Expands to up to 24MB by installing Macintosh PowerBook Duo 4MB or 8MB Memory Expansion Kits or larger-capacity third-party memory expansion cards in the expansion slots

Disk storage

• One internal 80MB or 120MB hard disk with 19 ms access time.

Display

• 9 in. (229 mm) diagonal.

- Bright backlit Supertwist liquid crystal display.

- 16-level gray scale, 640 by 400 pixels.

Battery

- Nickel hydride, provides approximately 2 to 4.5 hours of use before recharging is necessary.

- Recharge time: about 2 hrs. recharged standalone in computer.

Keyboard

- Built-in keyboard with standard Macintosh layout.

- Two-level tilt adjustment.

- LED shows when caps lock key is engaged.

Trackball

- 19-mm-diameter, dual-button trackball.

Interfaces

- One 152-pin PDS connector for attaching a Macintosh Duo Dock, Macintosh Duo MiniDock, Macintosh PowerBook Duo Floppy Adapter, or other expansion device.

- One RS-422 serial port for printer, modem, or other serial device.

- One RJ-11 Port for optional internal modem.

- One power adapter port.

File transfer options

- LocalTalk cables and System 7 file sharing.

- Serial cable and System 7 file sharing.

- Fax/data modem and AppleTalk Remote Access software.

- With Duo MiniDock: External Apple SuperDrive, SCSI Disk Adapter, and HDI-30 SCSI System Cable for external hard drives.

- With Duo Dock: Internal Apple SuperDrive, optional internal hard drive, and HDI-30 SCSI System Cable for external hard drive.

Modem

Optional internal Macintosh PowerBook Express modem; 14,400 bits per second (bps) data with fax send and receive at 9600 bps.

Includes Express Fax software:
- Hardware supports V.32bis, CCITT, and Bell standards.
- Software supports CCITT standard V.42 and V.42bis (for up to 57,000 bps effective throughput), MNP 2-5.
- Supports standard Hayes AT command set.

Microphone (built-in)

- Internal electret, omnidirectional.

Sound

- Built-in speaker.

- Monophonic 8-bit sound, capable of supplying the same signal to both channels of stereo headphones or other stereo equipment through the sound jack.

- 8-bit sound output, sampled at 11 or 22 kHz.

Disability access

CloseView, Easy Access, and visible beep are included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disabilities.

Size and weight

- Height: 8.5 in. (21.6 cm)

- Width: 10.9 in. (27.7 cm)

- Thickness: 1.4 in. (3.6 cm)

- Weight: 4.2 lb. (1.9 kg)

Electrical requirements

- Line voltage: 100 to 240 V

- Frequency: 50 to 60 Hz

Environmental requirements

- Operating temperature: 50° F to 104° F (10° C to 40° C)

- Storage Temperature: -40 to 65° C (-40 to 148° F)

- Relative humidity: 20% to 95% noncondensing

- Altitude: 0 to 15,000 ft. (0 to 4722 m)

- Operating altitude: 0 to 10,000 ft.(0 to 3048 m)

Article Change History:

26 Aug 1994 - Discontinued product.
08 Feb 1994 - Removed erroneous discontinuance notice.
02 Jun 1993 - Updated to correct voltage specification.
19 Feb 1993 - Updated to correct storage temperature range.

PowerBook Duo: Battery Information 10/92

Revised: 5/16/94
Security: Everyone

PowerBook Duo: Battery Information 10/92

==========

Article Created: October 19, 1992

TOPIC ----------

The PowerBook Duo battery is different from the batteries in other PowerBook systems.

DISCUSSION ----------

Advantages

Compared to the NiCad batteries used in other PowerBook models, the nickel-metal hydride (NiHy) rechargeable batteries in the PowerBook Duo:

• Are smaller and lighter.

• Have a 20% greater power capacity for the same size and voltage.

• Are considered environmentally safer because they lacks cadmium.

A fully-charged PowerBook Duo battery will operate approximately 2 to 4.5 hours, depending on the operating temperature, the age of the battery, and the power-saving features implemented.

A NiHy battery has a similar discharge curve to a NiCad, with a sharp drop of available power as the battery approaches discharge. This drop is predictable, and system software will give the user adequate warning to recharge or replace the battery before full discharge.

The terminals on the NiHy battery are more recessed than those on the NiCads, and there is little likelihood of an accidental external short. The batteries will ship with a case to ensure that nothing damages the battery or the customer.

Precautions

Nickel-metal hydride batteries requires certain precautions:

- Because the self-discharge rate of a stored battery is approximately twice that of a NiCad, stored batteries must be frequently recharged.

- A NiHy battery is much more sensitive to temperature, especially high temperatures (over 40°C). Approximately 50% of the battery capacity will remain if the battery has been stored for 14 days at 40°C. If left for months at this temperature, the battery could be permanently damaged. Charging NiHy batteries below 5° C can also cause irreversible damage to the battery.

- Overcharging, or over-discharging, will cause permanent battery damage. Due to this sensitivity, a special power management chip was built into the PowerBook Duo to control charging and discharging. The chip will also stop charging when the battery temperature exceeds a specific value.

Battery Charging

A NiHy battery, like a NiCad, should be fully discharged in order to obtain a full charge. To maximize battery life, fully discharge and then recharge the battery once every 30 days. This should be done any time you note that the run time of the battery has decreased. With proper care, a battery should last for at least a year.

It should take about two hours to charge a fully depleted battery with the computer shut down or in sleep.

Specifications

Maximum dimensions	17.8 x 77.8 x 106 cm 0.7 x 3.06 x 0.17 in
Maximum weight	.75 lb
Battery capacity	approximately 900 to 950 mAh
Operating Temperature	0 - 45°C

Disposal

Dispose of batteries in accordance with the mandatory or voluntary battery collection scheme in each country.

- In the United States, dead batteries should be taken to an Authorized Apple Service Provider, who will return the battery to Apple for recycling.

- European countries have separate collection and/or recycling programs for dead batteries.

- In other countries, an Apple Service Provider should be contacted for

appropriate battery disposal.

PowerBook Duo: Optional Battery Charger (10/95)

Revised: 10/2/95
Security: Everyone

PowerBook Duo: Optional Battery Charger (10/95)

==========

Article Created: October 19, 1992
Article Reviewed/Updated: 2 October 1995

TOPIC ----------

The PowerBook Duo Battery Charger is an optional accessory which can charge two PowerBook Duo batteries. Each battery slot works independently, so a user can insert or remove batteries at any time.

The recharger can be plugged directly into the power adapter that comes with the PowerBook Duo. You can also purchase a second power adapter to attach to the recharger.

Type I, II, and III Duo batteries can all be recharged in the recharger model M1812 (Marketing number M4178LL/B).

DISCUSSION ----------

Indicator Lights

The lights on the recharger indicate the following:

- No light: the recharger is not plugged in, or the battery is defective. If the light goes off during recharging, the battery is defective.

- Yellow light: the battery is charging.

- Green light: the battery is fully charged.

- Red light: If a red light appears when you place a Type III battery into the recharger, the recharger is either the older model recharger which will not work with a Type III battery, or it is a new recharger that needs to be updated.

To learn more about the different rechargers and how to update a recharger see the TIL article titled, "PowerBook Duo: Type III Battery Q & A."

Recharging Time

Recharging time in the Battery Charger for a fully depleted battery:

One battery	approximately 2 hours
Two batteries	approximately 4.5 hours

It takes about 2 hours to charge a fully depleted battery in a standalone Duo.

Both the battery in the PowerBook Duo, as well as a battery in the external charger, can be charged simultaneously using the same power supply. The charge times will differ depending on the following circumstances:

- The PowerBook is on and contains a battery that is not fully charged: The computer will charge the internal battery first, which should take about 2 hours. The external battery will not begin to charge until the internal battery is fully charged. After this, if the computer is in use, it will take approximately another 2 hours for one external battery or approximately another 4.5 hours for two external batteries to fully charge.

- The PowerBook is in sleep or shut down and contains an internal battery that is not fully charged. The internal and external batteries will charge simultaneously. If both batteries are fully depleted, it will take approximately 4.5 hours to charge both batteries.

- The PowerBook is in sleep or shut down and the internal battery is fully charged or absent. The external battery charges as if the recharger were not connected to the computer. If fully depleted, it will take about 2 hours to recharge.

Article Change History:
10 Oct 1995 - Corrected information about two batteries charging.
04 May 1995 - Added information about red light and new recharger model.

PowerBook 200 & 2300 Series: Docking/Undocking Procedures 10/95

Revised: 10/12/95
Security: Everyone

PowerBook 200 & 2300 Series: Docking/Undocking Procedures 10/95

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 12 October 1995

TOPIC ----------

This article explains the different scenarios under which it is safe to dock, undock, and sleep a PowerBook 200 or 2300 series computer connected to a Duo Dock, Duo Dock II, Duo Dock Plus, MiniDock, or Duo Floppy Adapter.

DISCUSSION ----------

The only time that hardware or data is at risk when connecting externals to a PowerBook 200 or 2300 series computer is if the computer is turned on and awake while the externals are being connected. If you work with the rule that the PowerBook is always off or sleeping when externals are connected, you should be safe in any situation. The following is a more specific synopsis of the different docking scenarios.

Duo Dock (includes all Duo Dock products)

The PowerBook computer must be off when docking to a Duo Dock. If docking is attempted while the PowerBook computer is asleep, the dock will eject the PowerBook computer. The PowerBook computer will crash if it is on when trying to Dock.

The PowerBook computer will not sleep when docked to a Duo Dock.

Pressing the eject button on the Duo Dock while the PowerBook computer is on will issue the Shutdown procedure and then eject the PowerBook computer.

You can physically lock the Duo Dock so that the computer cannot be removed. If you attempt to eject the computer, a dialog box explains that you must unlock the docking station before the Duo can be ejected.

MiniDock

The PowerBook computer can be connected to the MiniDock in sleep mode as long as there is not an external monitor or SCSI device attached.

The PowerBook computer can sleep when docked to a MiniDock as long as there is not an external monitor attached. If there is an external monitor attached, you will get the message the PowerBook computer cannot sleep.

The MiniDock can be removed when the PowerBook computer is off or sleeping.

Duo Floppy Adapter

The PowerBook computer can be connected to the Duo Floppy Adapter in sleep mode.

The PowerBook computer can sleep when docked to a Duo Floppy Adapter.

The Duo Floppy Adapter can be removed when the PowerBook computer is off or sleeping.

PowerBook Duo: Power Management Features 10/92

Revised: 5/16/94
Security: Everyone

PowerBook Duo: Power Management Features 10/92

==========

Article Created: October 19, 1992

TOPIC ----------

To increase battery run time, Apple introduced a power management system in the original Macintosh Portable and PowerBook. This power management system has been upgraded in the Macintosh Duo, and is called the InCharge Battery Saver.

InCharge Battery Saver is a combination of hardware and software that maximizes battery run time. The core of the InCharge Battery Saver is a custom microcontroller chip that automatically controls power management.

DISCUSSION ----------

A notebook computer's battery run time is affected by three key parts of the CPU:

- Screen Backlighting. Full brightness uses the maximum amount of battery power, whereas minimum brightness uses the minimum amount.

- Hard Drive Activity. Constantly spinning the hard drive up and down takes the most power; it is best to keep the drive off entirely, or turn it on only when necessary.

- Logic Board. The microprocessor itself requires the largest amount of power, and drain on the battery increases dramatically with an increase in system clock speed. InCharge can reduce power use in the Macintosh Duo up to 90% during idle periods by modulating the clock speed.

Power Saving Features

The InCharge Battery Saver provides the following power-saving features in the PowerBook Duo:

- Powers only a custom PowerBook Duo chip and DRAM in Sleep mode.

- Turns off the microprocessor when not in use.
- Spins down the hard drive after a predetermined amount of inactivity.
- Puts the CPU to Sleep after a predetermined amount of inactivity (user sets the interval).
- Turns off these components when not in use: modem, screen backlighting, ADB, serial ports, trackball, keyboard scanning, sound, real-time clock, and parameter RAM.
- Lets the user replace batteries while the Duo is in Sleep.
- Automatically charges the battery when the Duo is plugged in to AC or docked into a docking station that's plugged into AC.
- Controls charging of the batteries in the external battery charger when attached to the AC adapter.
- Supports Nickel Hydride (NiHy) batteries.
- Provides a battery gauge to monitor battery level.
- Automatically senses if the AC adapter is plugged into a power outlet.
- Has worldwide AC adapter.
- Automatically keeps hard drive spun up when docked in Duo Dock.
- Turns PowerBook display off when it's docked in Duo Dock.
- Can operate PowerBook Duo on the power adapter without the main battery installed.

PowerBook 160, 180, and Duo: Control Panels (7/95)

Revised: 7/20/95
Security: Everyone

PowerBook 160, 180, and Duo: Control Panels (7/95)

==========

Article Created: 19 October 19 1992
Article Reviewed/Updated: 20 July 1995

TOPIC ----------

For the PowerBook 160, 180, and PowerBook 200 series (Duo) models, one control panel is changed and two are new:

- The control panel previously called Portable is now called PowerBook.
- The new AutoRemounter control panel mounts file servers when the system comes out of sleep.
- The new PowerBook Display control panel controls screen dimming and a new feature called mirroring.

DISCUSSION ----------

PowerBook Control Panel

This control panel no longer includes separate controls for system and hard drive sleep.

Like the PowerBook 100, the PowerBook 160 and 180 support SCSI Disk Mode. The SCSI ID number for SCSI Disk Mode is set from this control panel.

The options button lets the user keep the system awake when plugged in and set the processor speed.

The Reduced speed button reduces the clock speed by half and adds 10 to 15 minutes to battery life.

The options dialog is reduced on the PowerBook 160 and 180 to make sure the user does not turn off power cycling (system rest). To get the full dialog, hold down the Option key while clicking the Options button. When power cycling is turned off and a 16-in. monitor is used with full hard drive access, the system is not

able to charge the battery.

PowerBook Display Control Panel

This control panel lets the user set the amount of time the PowerBook takes before the backlight and external monitor turn off to save power. The display is dimmed and turned off only after a period of no keyboard or mouse activity. This is one of the best ways to increase battery life.

The video mirroring feature lets the PowerBook display the same content simultaneously on both the internal display and external display. Mirroring sets the screen size to 640 by 400, letting the presenter look at the PowerBook screen and see exactly what is on the external display or projection device. Video Mirroring uses QuickDraw to catch the calls to the screen to implement video mirroring. If an application or init does not use QuickDraw, it does not work with video mirroring; such applications have to be modified to work with this feature.

AutoRemounter Control Panel

This control panel reconnects file servers when the system wakes up from sleep or from shut down. When AutoRemounter is turned on, the user does not see the dialog box stating network services will be lost when Sleep is selected.

PowerBook 160 and 180: 16-Level Gray Scale Display 10/92

Revised: 5/16/94
Security: Everyone

PowerBook 160 and 180: 16-Level Gray Scale Display 10/92

==========

Article Created: October 19, 1992

TOPIC -----

The internal display in the PowerBook 160 and 180 can be set to 2, 4, or 16 gray levels. A gray-scale display allows more realistic images and icons.

DISCUSSION -----

Overview

	PowerBook 160	PowerBook 180
Display size	640 x 400	640 x 400
Type	Supertwist	Active Matrix
Response time	200 ms	100 ms

Support Issues

The display has a fixed color lookup table, which may cause some incompatibility with applications that expect to change the values in the color table. The PowerBook gray-scale display is the first device with multiple color/gray levels that does not allow the application to change the color table: the application tries to change the color table, but the screen values don't change. This will cause problems on the internal display but not an external display. If problems are seen on the external display, set the internal display to black and white, and move the menu bar to the external display. Applications that have this problem include MacroMind Director and some graphics programs.

The Supertwist display will have problems displaying one-pixel gray lines on the screen. The line may shake on the screen in some of the gray-scale values.

Adjusting the contrast or brightness will help in most cases, but in other cases the gray level will pulse or shake. The Active Matrix display has none of these display features. Setting the display to black and white clears up the problem.

PowerBook 160 and 180: RAM Expansion (12/96)

Revised: 12/3/96
Security: Everyone

PowerBook 160 and 180: RAM Expansion (12/96)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 2 December 1996

TOPIC ----------

The PowerBook 160 and 180 can be expanded to 14 MB of RAM.

DISCUSSION ----------

4 MB of RAM is on the logic board and there is one memory slot. The slot is physically identical to the PowerBook 100, 140, 145, and 170 memory connector, but uses a previously unused pin to determine the speed of the RAM chips installed.

If existing RAM cards (100 ns) are used, an extra wait state will be included when the system accesses that memory. The PowerBook 180 will run faster if 85 ns chips are used, but this is not the case with the PowerBook 160. Apple will sell two 4 MB cards: one for existing units and another for the PowerBook 180.

PowerBook 180 RAM Speed	Wait States
85 ns (recommended)	two
100 ns	three

Third-party vendors will make 4 MB, 8 MB, and 10 MB cards available for the PowerBook 160 and 180. These cards will not work with other PowerBook models.

Article Change History

PowerBook 160 and 180: Video Output 10/92

Revised: 5/16/94
Security: Everyone

PowerBook 160 and 180: Video Output 10/92

==========

Article Created: October 19, 1992

TOPIC ----------

The PowerBook 160 and 180 support external video displays.

DISCUSSION ----------

There is a high-density video connector on the back of the PowerBook 160 and 180, and a high-density to standard DB-15 cable is included with the unit. An additional 512K of VRAM, on the logic board, supports video output.

The following displays are supported (all 8 bits per pixel):
• Macintosh 12" Monochrome Display
• Macintosh 12" RGB Display
• AppleColor High Resolution RGB Monitor (13")
• Macintosh Portrait Display
• Macintosh 16" Color Display
• VGA Monitors (special third-party VGA cable required)
• SVGA Monitors (VGA cable, 600 x 800 screen size)

The location of the internal floppy drive requires that external displays be placed on the left side of the PowerBook.

For any display not sold by Apple, check with the vendor to make sure it will work, or test the display before buying. The VGA/SVGA cable is the same cable used to connect the Macintosh LC or LC II to a VGA monitor.

A new custom video output chip was added to the processor card, and the I/O board was modified with an additional mini-15 connector. The cable that is included turns the mini-15 into the standard DB-15 connector with standard Apple video connector pinouts. The 512K of VRAM on the logic board can not be expanded to support higher bit depth displays. The video chip will only support 256 color displays. When using external monitors the computer should be plugged in to the power adapter.

AppleCD 150 and AppleCD 300: Differences

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 19 August 1996

TOPIC ----------

This article provides an overview of how the AppleCD 300 differs from the AppleCD 150 (obsolete).

DISCUSSION ----------

The AppleCD 300 is a high-performance, feature-rich CD-ROM drive that provides capabilities not available on the AppleCD 150.

The AppleCD 300 drive gives users faster access to data because it can spin twice as fast as most existing CD-ROM drives. For optimal use of all CD titles, the drive can be operated in both single-speed (1X) mode and double-speed (2X) mode. Compared to the AppleCD 150, QuickTime movies and animation are much smoother.

The AppleCD 300 can read Kodak multisession Photo CD discs -- a capability not available on the AppleCD 150.

The AppleCD 300 drive also enables CD-ROM title development in two new formats (CD+G and CD+MIDI) and allows CD digital audio data to be transferred to the Macintosh over the SCSI bus for editing and recording.

Refer to these Tech Info Library articles for more detailed information about both the AppleCD 150 and AppleCD 300 drives:

- AppleCD 150: Description
- AppleCD 150: Specifications
- AppleCD 300 and 300i CD-ROM Drives: General Description

AppleCD 300i: How to Install Macintosh CD-ROM Setup Software

Revised: 10/13/92
Security: Everyone

AppleCD 300i: How to Install Macintosh CD-ROM Setup Software

==========

Article Created: 19 October 1992

TOPIC ----------

I purchased a Macintosh with the optional AppleCD 300i CD-ROM drive. How can I tell if the CD-ROM software necessary to run that drive is installed?

If the software isn't installed, how do I install it?

DISCUSSION ----------

To check for CD-ROM software, pull down the Apple menu and look for "CD Remote". If "CD Remote" appears in that pull-down menu, the CD-ROM software is installed.

If "CD Remote" isn't in the Apple menu, follow these step to install the software:

1) Insert the Macintosh CD-ROM Setup disk into your computer's floppy disk drive.

2) Open the Macintosh CD-ROM Setup disk icon.

3) Open the Installer icon. The Easy Install dialog box appears.

4) Click Install.

5) When the installation is complete, restart your Macintosh.

PowerBook Express Modem: Description and Software (4/95)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 04 April 1995

TOPIC ----------

This article describes the Macintosh PowerBook Express Modem.

DISCUSSION ----------

The Macintosh PowerBook Express Modem features high-speed data communications and fax send/receive capability for members of the PowerBook family.

The Express Modem is available in two models:

• one for the PowerBook 160 and PowerBook 180

• one for the PowerBook Duo family.

There is no difference in features between the two. Each is a low-power modem that fits neatly into the computer.

The PowerBook Express Modem can send data at a rate as high as 14,400 bits per second (bps) when communicating with compatible V.32bis modems.

In terms of compatibility, the Express Modem supports the Hayes AT command set CCITT, Bell, Hayes, and Fax Group 3 standards.

When running the Express Fax software that comes with the modem, you can send and receive faxes at 9600 bps. The package also supports fax forwarding, quick-send, and calling card. The Fax Viewer application lets you view, copy, print, and save faxes as MacDraw-compatible documents.

The modem software takes over the external modem port. When the modem is turned on, it requires 300K of system RAM.

Article Change History:
04 Apr 1995 - Corrected maximum data rate for modem.

Macintosh Duo Dock: Description (7/95)

Revised: 7/6/95
Security: Everyone

Macintosh Duo Dock: Description (7/95)

==========

Article Created: October 19, 1992
Article Reviewed/Updated: 6 July 1995

TOPIC ----------

This article describes the features of the Macintosh Duo Dock.

DISCUSSION ----------

Overview
========
The Macintosh Duo Dock provides expansion capabilities for the Macintosh PowerBook Duo computers.

The Duo Dock allows you to connect your PowerBook Duo to a complete desktop system -- which can include a large color display, an extended keyboard, a mouse, and other peripherals -- and provides expansion card capabilities and connections to your network and network servers.

Apple's new PowerLatch docking technology ensures easy, automatic docking between the Macintosh PowerBook Duo and the Duo Dock, so there is no need to plug and unplug cables or to reconfigure the system each time you insert the PowerBook Duo into the Duo Dock.

Macintosh Duo Dock Features
==========
• PowerLatch docking technology for easy, automatic, one-step docking

• Internal 1.4MB Apple SuperDrive

• Built-in video support for 256 colors, expandable to 32,000 colors

• Supports most Apple displays, including the Macintosh 16" Color Display, as well as some VGA and SVGA displays

• Two NuBus expansion slots

- 10 built-in ports, including SCSI port for up to six peripherals, such as an external hard disk or CD-ROM drive

- Security key for locking PowerBook Duo and slot for a security cable

Ordering Information

Macintosh Duo Dock & Duo MiniDock: Specifications 1/96

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 3 January 1996

TOPIC ----------

This article provides the technical specifications for the Macintosh Duo Dock and Macintosh Duo MiniDock.

DISCUSSION ----------

MACINTOSH DUO DOCK TECHNICAL SPECIFICATIONS

Coprocessor

• Optional 68882 math coprocessor

Disk Storage

• One internal 1.4MB Apple SuperDrive

• Bay for optional 1-in. high 3.5-in. SCSI hard disk drive (many capacities available)

Video Display

• Built-in video support for most Apple displays, up to and including the Macintosh 16" Color Display

• Supports some VGA and SVGA monitors with adapter cable

Video RAM

• 512K (256 colors or shades of gray), expandable to 1MB (32,000 colors) with optional 512K VRAM SIMM

- Provides enhanced video performance when optional 512K VRAM is installed

Interfaces

- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other input devices
- One video port
- Two internal NuBus expansion slots for cards that provide Ethernet, Token Ring, additional video, or other capabilities
- Two RS-422 serial ports for printers, modems, and other serial devices
- Pass-through port for the optional modem in Macintosh PowerBook Duo notebook computer (RJ-11 or Mini-DIN-8)
- One HDI-30 SCSI port for external hard disks, scanners, CD-ROM drives, and other devices
- One sound-in port for monaural sound input
- One sound output port for external audio amplifier

Security

- Key lock prevents removal of the Macintosh PowerBook Duo from the Macintosh Duo Dock
- Slot for cable to secure the Macintosh Duo Dock to a desk

Electrical Requirements

- Line voltage: 85 to 270 V
- Frequency: 47 to 63 Hz

Environmental Requirements

- Operating temperature: 50° F to 104° F (10° C to 40° C)
- Storage temperature: -40° F to 116° F (-40° C to 47° C)
- Relative humidity: 20% to 95% noncondensing
- Altitude: 0 to 15,000 ft. (0 to 4722 m)

Size and Weight

- Height: 4.75 in. (12.1 cm)
- Width: 12.25 in. (31.1 cm)

- Depth: 16.25 in. (41.3 cm)

- Weight: 13.1 lb. (5.95 kg)
  (weight will be greater with internal hard disk)

MACINTOSH DUO MINIDOCK TECHNICAL SPECIFICATIONS

Video Display

- Built-in video support for most Apple displays, up to and including the Macintosh 16" Color Display

- Supports some VGA and SVGA monitors with adapter

Video RAM

- 512K (256 colors or shades of gray)

Interfaces

- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other devices

- One video port

- Two RS-422 serial ports for printers, modems, and other serial devices

- Pass-through port to support the optional Macintosh PowerBook Express Modem in Macintosh PowerBook Duo notebook computer (RJ-11 or Mini-DIN-8)

- One HDI-30 SCSI port for external hard disks, scanners, CD-ROM drives, and other devices

- One HDI-20 port for the external 1.4MB floppy disk drive (MS-DOS compatible)

- One sound-in port for monaural sound input

- One sound output port for external audio amplifier

Security

- Slot for security cable

Electrical requirements

- Line voltage: 85 to 270 V

- Frequency: 47 to 63 Hz

Environmental requirements

- Operating temperature: 50° F to 104° F (10° C to 40° C)
- Storage temperature: -40° F to 116° F (-40° C to 47° C)
- Relative humidity: 20% to 95% noncondensing
- Altitude: 0 to 15,000 ft. (0 to 4722 m)

Size and weight

- Height: 2.1 in. (5.3 cm)
- Width: 10.6 in. (26.9 cm)
- Depth: 3.2 in. (8.1 cm)
- Weight: 1.24 lb. (.56 kg)

ORDERING INFORMATION

Macintosh Duo Dock ** Order No. M4179LL/A

- Macintosh Duo Dock with internal 1.4MB Apple SuperDrive
- Mouse and microphone
- Power cable
- Security keys
- Complete setup, learning, and reference documentation
- Limited warranty statement

Macintosh Duo MiniDock ** Order No. M4181LL/A

- Macintosh Duo MiniDock
- Complete setup, learning, and reference documentation (U.S., Japan)
- Limited warranty statement

Macintosh PowerBook Duo Floppy Adapter* Order No. M4180LL/A

- Macintosh PowerBook Duo Floppy Adapter
- Plastic case for storage and travel

- Limited warranty statement

Other Products

PowerBook Duo: Connecting External Monitors (5/95)

Revised: 5/18/95
Security: Everyone

PowerBook Duo: Connecting External Monitors (5/95)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 18 May 1995

TOPIC ----------

To connect an external monitor to your PowerBook 200 Series computer, it must be connected to a docking station that supports external video.

NOTE:
The PowerBook 200 Series includes the Duo 210, 230, 250, 270c, 280, and 280c PowerBook computers.

Apple produces three docking stations for the PowerBook 200 Series:

• The Macintosh Duo Dock

• The Macintosh Duo Dock II+. The Duo Dock II+ replaces the Duo Dock II. The Duo Dock II+ has the same video output capabilities as the Duo Dock II.

• The Macintosh Duo MiniDock

Each of these stations supports external video.

DISCUSSION ----------

Macintosh Duo Dock

The Macintosh Duo Dock has 512K VRAM standard and an external DB-15 video-out port. It supports these displays and bit densities:

Display	Bit Density	# of Colors/Shades of Gray
Apple 12-in. Monochrome	8 bit	256 shades of gray
Apple 12-in. RGB	8 bit	256 colors/shades of gray
AppleColor Hi-Res RGB	8 bit	256 colors/shades of gray

Apple Color	8 bit	256 colors/shades of gray
Apple Portrait	8 bit	256 shades of gray
Apple 16-in. RGB	8 bit	256 colors/shades of gray
VGA (640 by 480)	8 bit	256 colors/shades of gray
SVGA (800 by 600)	8 bit	256 colors/shades of gray

You can add an additional 512K VRAM SIMM to the Duo Dock. This is the same 512K VRAM SIMM that is used in the Macintosh LC and LC II.

With 1MB of VRAM installed, the Duo Dock supports these displays and bit densities:

Monitor	Bit Density	# of Colors/Shades of Gray
Apple 12-in. Monochrome	16 bit	256 shades of gray
Apple 12-in. RGB	16 bit	32,000 colors or 256 shades of gray
AppleColor Hi-Res RGB	16 bit	32,000 colors or 256 shades of gray
Apple Color	16 bit	32,000 colors or 256 shades of gray
Apple Portrait	16 bit	32,000 colors or 256 shades of gray
Apple 16-in. RGB	16 bit	32,000 colors or 256 shades of gray
VGA (640 by 480)	16 bit	32,000 colors or 256 shades of gray
SVGA (800 by 600)	16 bit	32,000 colors or 256 shades of gray

NOTE:
It is only possible to display 256 shades of gray, even if the bit density is greater than eight.

Macintosh Duo Dock II+ and Duo Dock II (Discontinued)

The Duo Dock II+ comes with 1 megabyte of VRAM standard and is not expandable. The Duo Dock II+ supports the multiple resolutions of the Multiple Scan displays without needing an adaptor. The Duo Dock II+ supports these displays and bit densities:

Monitor	Bit Density	# of Colors/Shades of Gray
Apple 12-in. Monochrome	16 bit	256 shades of gray
Apple 12-in. RGB	16 bit	32,000 colors or 256 shades of gray
AppleColor Hi-Res RGB	16 bit	32,000 colors or 256 shades of gray
Apple Color	16 bit	32,000 colors or 256 shades of gray
Apple Portrait	16 bit	32,000 colors or 256 shades of gray
Apple 16-in. RGB	16 bit	32,000 colors or 256 shades of gray
VGA (640 by 480)	16 bit	32,000 colors or 256 shades of gray
SVGA (800 by 600)	16 bit	32,000 colors or 256 shades of gray
Apple 17-in. Multiple Scan:		
640 x 480	16 bit	32,000 colors or 256 shades of gray
832 x 624	16 bit	32,000 colors or 256 shades of gray
1024 x 768	8 bit	256 colors/shades of gray
Apple 20-in. Multiple Scan:		
640 x 480	16 bit	32,000 colors or 256 shades of gray
832 x 624	16 bit	32,000 colors or 256 shades of gray
1024 x 768	8 bit	256 colors/shades of gray

1152 x 870	8 bit	256 colors/shades of gray

NOTE:
The Duo Dock requires a video display adapter to change resolutions on Mulitple Scan monitors unless System 7.5 is installed.

Macintosh Duo MiniDock

The Macintosh Duo MiniDock comes with 512K VRAM standard. Its VRAM cannot be upgraded.

The Macintosh Duo MiniDock can be configured so the external monitor and the Duo screen display the same image. In this case, the external monitor is limited to a video display of 640 by 400 pixels, the same as the LCD.

The Macintosh Duo MiniDock supports these displays and bit densities:

Monitor	Bit Density	# of Colors/Shades of Gray
Apple 12-in. Monochrome	8 bit	256 shades of gray
Apple 12-in. RGB	8 bit	256 colors/shades of gray
AppleColor Hi-Res RGB	8 bit	256 colors/shades of gray
Apple Color	8 bit	256 colors/shades of gray
Apple Portrait	8 bit	256 shades of gray
Apple 16-in. RGB	8 bit	256 colors/shades of gray
VGA (640 by 480)	8 bit	256 colors/shades of gray
SVGA (800 by 600)	8 bit	256 colors/shades of gray

NOTE:
A DB-15 to VGA or SVGA adapter cable is needed to connect a VGA or SVGA monitor to either Apple docking station.

No displays are supported by the Apple docking stations other than the ones listed above.

System 7: Optimizing Performance with Virtual Memory

Revised: 11/2/92
Security: Everyone

System 7: Optimizing Performance with Virtual Memory

==========

Article Created: 19 October 1992

TOPIC ----------

1) Is it true that I shouldn't set the virtual memory to more than twice the real RAM installed in the machine, to avoid too much "bank switching"?

2) Is there any performance loss by placing the virtual memory file on a hard disk other than the startup disk?

3) Will I get better performance if I set virtual memory to LESS than twice the amount of real RAM?

DISCUSSION ----------

1) With 32-bit addressing on and enough space available to allocate on hard disk, you can create a very large virtual memory address space. However, it's best for performance reasons to limit the size of your virtual memory to twice the size of installed RAM. By limiting the size of your virtual memory, you will help eliminate excessive paging activity, known as "thrashing".

2) You should place your memory file on a drive that is least accessed. If you place the memory file on a disk that has the system file and data files that are accessed by applications, then performance of virtual memory will degrade because the disk read/write heads must be jumping around to satisfy the system or application requests. By placing your file on the least accessed disk, the read/write head will more likely be left in a state where it won't have to travel far on its next request.

3) You will get better performance by using less than twice the amount of real memory. This is because more of your application will reside in main memory than on disk -- reducing paging activity. The flip side of this is that there will be less room in memory for

additional applications.

The Macintosh file system manages files efficiently by fragmenting them, but fragmentation can eventually slow your Macintosh computer's overall performance and increase wear on the drive. By defragmenting your files, including the virtual memory file, you can improve the disk access speed and therefore improve performance. Central Point Software has a product (Central Point Optimizer) that will defragment your disk.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

System 6.0.8L: ReadMe File (8/95)

Revised: 8/17/95
Security: Everyone

System 6.0.8L: ReadMe File (8/95)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 17 August 1995

TOPIC ----------

System 6.0.8L was a limited maintenance release of system software for markets in Apple Pacific. It was engineered to address some special needs for those markets that did not have access to System 7 at the time.

The following is the Read Me file included with the software.

DISCUSSION ----------

UPDATE

SYSTEM SOFTWARE VERSION 6.0.8L

For the Macintosh Classic II and Macintosh PowerBook 100

What is version 6.0.8L?

System software version 6.0.8L allows you to use System 6 on your computer while sharing a network with System 7 users. As the L in the version number indicates, this software runs on a limited number of computers. It is primarily intended for the Macintosh Classic II and Macintosh PowerBook 100. However, it also runs on the Macintosh Classic, Macintosh LC, and Macintosh LC II. System software version 6.0.8L does not work on any other Macintosh computers.

Before you install version 6.0.8L

Before using the Installer program to install system software version 6.0.8L, be sure to remove any virus detection or security programs from your System Folder. After you have installed version 6.0.8L, you can reinstall those programs. If you are running system software version 7.0 or later on your computer, you should start up your computer using the 6.0.8L System Startup floppy disk and remove the System 7 System Folder from your hard disk before installing version

6.0.8L on your hard disk.

If you install a version earlier than 6.0.8L

If, after having installed version 6.0.8L on your hard disk, you decide to install an earlier version of system software, you must first remove the version 6.0.8L System Folder from your hard disk.

Sharing a LaserWriter on a network

If you upgrade to system software version 6.0.8L and you are on a network of shared LaserWriter printers, everyone on your network should upgrade to version 6.0.8 or 6.0.8L, or to System 7. If someone prefers not to upgrade their system software, they should at least install the new printing software using the Customize option in the Installer program found on the 6.0.8L System Startup disk. If someone prints on a network with a version of printing software earlier than 6.0.8, the printer must stop and "initialize" for that earlier version each time it's used. This slows down the printing process for everyone.

Using a Personal LaserWriter LS

In order to print with a Personal LaserWriter LS, you will need to upgrade your Personal LaserWriter LS driver to version 7.1.1 or greater. To obtain an upgrade for this driver, call the toll-free Apple software upgrade line, 800-947-5176, or pick up a mail-in upgrade coupon from your Apple dealer.

Using a LaserWriter IIsc

The Personal LaserWriter SC printing software replaces the earlier LaserWriter IIsc software. When you upgrade your system software to version 6.0.8L, the Installer automatically replaces the LaserWriter IIsc software with the Personal LaserWriter SC software. The new software works with both the Personal LaserWriter SC and the LaserWriter IIsc.

Differences between System 6 and System 7

A number of things in system software version 6.0.8L work differently than they do in System 7. Some System 7 features are not available in System 6. Some System 7 features are different from equivalent features in System 6.

These are System 7 features that do not exist in version 6.0.8L:

- the Help menu

- the Views control panel

- outline views of folders

- keyboard navigation in the Finder

- aliases

- file sharing

- virtual memory

- stationery pads

- custom icons

- Startup Items and Apple Menu Items folders

- automatic updating with publish and subscribe

- labels for icons in list views

- the ability to open and save documents on the desktop using the Open and Save dialog boxes

These are System 7 features that work differently in version 6.0.8L:

- the Application menu (in System 6 you use the MultiFinder icon instead)

- the System Folder's organization of files

- desk accessories

- fonts and sounds

- control panels

- the Find command (in version 6.0.8L you use the Find File desk accessory instead)

- the timing of when the Trash is emptied

Where to get a manual for System 6

To get complete documentation for system software version 6.0.8L, you can ask your Apple dealer for a copy of the Macintosh Reference (part number 030-4015-B). Your dealer can order that book for you. The Macintosh Reference and this update together contain all of the information you need to use system software version 6.0.8L.

DISCUSSION -----

What is QuickTime, and How Is It Used?

QuickTime is the multimedia architecture for the Macintosh family. It allows any color-capable Macintosh to integrate dynamic data types such as video, sound, and animation into presentations, training materials, and documents. Hundreds of commercial applications support QuickTime.

QuickTime appeals to a broad range of users in numerous industries, who use QuickTime for training, entertainment, communication, and presentations.

The QuickTime architecture has four key components:
- True synchronization of streams of information in time -- video and sound, for example.
- A variety of compression schemes, to minimize storage requirements.
- A standard graphical interface for navigating, manipulating, and editing data.
- A rich, flexible file format that readily accommodates these new information types.

What's New in QuickTime 1.5?

QuickTime 1.5, which is offered as an extension to System 7, provides:
- Better performance.
- Higher compression ratios.
- Better frame rates.
- Larger movie frame sizes.
- Support for Kodak's new Photo CD technology.
- Support for full-screen/full-motion video with available add-on hardware.

QuickTime 1.5 Features

- Larger screen software-only movie playback. Up to 320 x 240 pixels at up to 15 frames per second, or four times the screen area on a Macintosh LC II. Movies on screen will now be twice as big. Alternatively, movies of 160 x 120 pixels can be played back at up to 30 frames per second on a Macintosh LC II.

- Full support for full-screen, full-motion digital video cards from third-party developers. Hardware-assisted playback performance is also doubled. QuickTime supports third-party solutions offered by SuperMac, NuVideo, and RasterOps at video sizes up to 640 x 480 pixels at 30 frames per second.

- Integrated support for Kodak Photo CD enables users to have their photos digitized onto a CD-ROM where QuickTime can access them. Features include easily viewed "thumbnails," QuickTime overview movie of photo images, and file-format translation -- so that Photo CD images can be pasted into any Macintosh application that supports PICT files.

- Improved CD-ROM data handling for enhanced QuickTime movie playback from a CD.

- Improved network performance for better CD playback over a network.

- Faster 1-bit dithering offers enhanced and smoother viewing of QuickTime movies on PowerBooks and other monochrome computers.

- Generic media handlers allow developers to incorporate different data types into QuickTime movies to create new movie track types.

- Text Track, a new feature that allows integration of texts into QuickTime movies.

- Human Interface support for compression settings, sound input devices, and video digitizers. Developers can now easily change settings and features in their hardware.

How Do I Get QuickTime 1.5?

QuickTime 1.5 is bundled with:

- System 7.1 Update Kit
- System 7 Personal Upgrade Kit
- System 7 MultiPack.

QuickTime 1.5 will also be distributed by APDA, on the Developer CD, with many third-party products, and from bulletin boards and user groups. Apple offers developer licensing programs.

What Are the Hardware Requirements?

QuickTime works with all Macintosh computers that have at least a 68020

processor, 2MB of memory, and System 6.0.7 or any version of System 7.

Performa 200: Specifications

Revised: 4/5/93
Security: Everyone

Performa 200: Specifications

==========

Article Created: 22 October 1992

Article Change History

04/05/93 - CORRECTED
• But 4MB configuration still includes just 2MB on the board.
01/19/93 - CORRECTED
• Now ships in 4MB configuration.
11/02/92 - REVISED
• To correct system software version number

TOPIC ----------

This article provides technical specifications for the Macintosh Performa 200 computer.

DISCUSSION ----------

Microprocessor

- MC68030, 32-bit architecture, 16 MHz clock speed

Memory

• The Performa 200 comes with 2MB of RAM on the logic board and two memory expansion slots for SIMMs (Single In-line Memory Modules), which are initially filled with 2 1MB SIMMs for a total of 4MB.

• Expandable to 10MB of RAM by installing SIMMs in the available slots (dealer installation required).

• 512K of ROM

• Virtual Memory capable

Disk Drives

- Built-in Apple SuperDrive 1.4MB floppy disk drive
- 1/3 height internal 80MB Apple SCSI hard disk drive
- Optional external Apple SCSI hard disk drive(s)

Video display

- Built-in 9-inch diagonal, high-resolution (512 by 342 pixels) bitmapped monochrome display

Interfaces

- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other devices daisy-chained through a low-speed synchronous serial bus
- Two serial (RS-232/RS-422) ports, 230 kilobits per second maximum (up to 0.920 megabits per second if clocked externally)
- SCSI interface, using a 50-pin internal connector and a DB-25 connector for the first external device; all subsequent SCSI-based peripherals use standard SCSI-to-SCSI interface cables.
- 3.5-inch external floppy disk drive (800K or 1.4MB) interface
- Sound port for external audio amplifier or headphones
- Sound-in port for monaural sound input

Keyboard

- ADB keyboard with numeric keypad
- Two-level tilt adjustment

Mouse

- Apple Desktop Bus (ADB) Mouse, mechanical tracking, optical shaft or contact encoding: 90 to 110 pulses per inch (3.51 to 4.29 pulses per mm) of travel

Microphone

- Electret, omnidirectional; output voltage is 4 millivolts, peak to peak, at normal volume.

Sound Generator

- Monophonic 8-bit digital-analog conversion using 11- or 22-kilohertz sample rate, capable of driving stereo headphones or other stereo

equipment through the sound jack

Clock/Calendar

• Custom chip with long-life lithium battery

Fan

• 10 cu. ft./min. axial

• Positive pressure cooling

System Software

At introduction, the Performa 200 ships with System Software version 7.0.1P. This version has all the functionality and power of System 7.0.1, with special enhancements for first-time users:

• Application Launcher. Provides easy location and launching of all applications while retaining full Finder access.

• Default Document Folder. Provides a default location for storing documents.

• Layer Hiding. Provides easier navigation by hiding non-active layers. Users can easily switch to the Finder or to another program from the application menu.

• At Ease. Lets adults share the Performa 200 with others, and makes it easy for children to launch applications -- while protecting the hard disk.

• Backup & Restore. An easy way to create a set of back-up disks, and to restore the contents of the hard disk if necessary.

Disability Access

• CloseView, Easy Access, and visible beep included with system software. These features and third-party options provide alternative input and output tools for people with disabilities.

Electrical Requirements

• Line voltage: 120 volts AC, RMS (nominal)

• Frequency: 47 to 63 Hz, single phase

• Power: 100 watts maximum

ADB Power Requirements

• Maximum current draw for all ADB devices: 500 milliamps (a maximum of three devices is recommended)

• Mouse draws 80 milliamps.

• Keyboard draws 25 milliamps.

Size and Weight

• Main unit
  - Height 13.2 inches (33.6 cm)
  - Width 9.7 inches (24.6 cm)
  - Depth 11.2 inches (28.5 cm)
  - Weight 17.1 lb. (7.8 kg)

• Mouse
  - Height 1.1 inches (2.8 cm)
  - Width 2.1 inches (5.3 cm)
  - Depth 3.8 inches (28.5 cm)
  - Weight 6 oz. (.17 kg)

• Keyboard
  - Height 1.3 inches (3.3 cm)
  - Width 16.0 inches (40.5 cm)
  - Depth 5.9 inches (15.1 cm)
  - Weight 1.96 lb. (.89 kg)

Operating Environment

• Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)

• Storage temperature: -40 to 116.6 degrees F (-40 to 47 degrees C)

• Relative humidity: 5% to 95% noncondensing

• Maximum altitude: 15,000 ft. (4,722 m)

Noise Level

  < 40db measured from the seated operator position.

Performa 400: Specifications

Revised: 7/26/94
Security: Everyone

Performa 400: Specifications

==========

Article Created: 22 October 1992

TOPIC ----------

This article gives technical specifications for the Macintosh Performa 400 computer.

DISCUSSION ----------

Processor

- MC68030, 32-bit architecture, 15.6672 megahertz (MHz) clock frequency (includes built-in memory management unit).

Memory

- 4MB RAM, expandable to 10MB
- 512K of read-only memory (ROM)
- 256 bytes of parameter memory (PRAM)
- Virtual Memory Capable

Video RAM

- Comes with 512K video RAM. The following video modes are supported:
  - Macintosh 12" RGB Display (512 x 384 pixels) at 1, 2, 4, 8 and 16 bits per pixel
  - Macintosh High-Resolution Monochrome Display, AppleColor High-Resolution RGB Monitor, Macintosh Performa and Performa Plus Display and Macintosh Color Display (640 x 480 pixels) at 1, 2, 4 and 8 bits per pixel

Disk Drives

- Built-in Apple SuperDrive 1.4MB high-density floppy disk drive
- Internal 80MB SCSI hard disk drive
- Optional external Apple SCSI hard disk drive

Sound Generator

Custom sound chip, including mono sampling generator capable of driving stereo miniature phone jack headphones, or stereo equipment by sending the same output into each channel.

Power Input

- Line voltage: 100-240 volts AC, RMS automatically configured
- Frequency: 50-60 Hz ±3 Hz single phase
- Power: 50 watts maximum, not including monitor power

Clock/Calendar

CMOS custom chip with long-life lithium battery

Interfaces

- One Apple Desktop Bus port supports a keyboard, mouse, and other devices daisy-chained through a low-speed, synchronous serial bus (maximum of three chained devices)
- Two serial (RS-232/RS-422) ports, 230.4 kilobits per second maximum (up to 0.920 megabits per second if clocked externally)
- SCSI interface
- Video port supports RGB and monochrome monitors of various sizes and resolutions
- Internal expansion slot for processor-direct expansion card
- Sound output port capable of delivering monophonic sound to both channels of a stereo device
- Sound input port for monaural sound input

Monitors

- Supports the following monitors:
  - Macintosh Performa Display
  - Macintosh Performa Plus Display
  - Macintosh 12-inch RGB Display
  - Macintosh 12-inch Monochrome Display
  - AppleColor High-Resolution RGB Monitor
  - Macintosh Color Display

Keyboards

Supports all Apple Desktop Bus (ADB) keyboards

Mouse

ADB mouse: either mechanical tracking, optical shaft, or contact encoding

Apple Desktop Bus Power Requirements

- Maximum power draw for all ADB devices: milliamperes (mA)
- Mouse draws 80 mA

• Keyboard draws 25-80 mA (varies with the keyboard model used)

Note: Up to three ADB devices can be daisy-chained to the ADB port.

RAM Configurations

RAM in the Performa 400 is provided both on the logic board and in packages called Single In-line Memory Modules, or SIMMs. The SIMMs contain dynamic RAM chips on a single circuit board, with electrical "finger" contacts along one edge that plug into the SIMM sockets on the computer's logic board.

The Performa 400 can work with any of several RAM configurations, depending on the density of the RAM chips that are mounted on the SIMMs. The Performa 400 can use only 1MB, 2MB, or 4MB RAM SIMMs. Don't purchase 256K SIMMs for use with the Performa 400. Possible RAM configurations include 4MB, 6MB, 8MB, and 10MB.

Important: Performa 400 SIMMs should be fast-paged mode 100 nanoseconds (ns) RAM access time or faster. The slower 120 ns and 150 ns SIMMs available for some other models of Macintosh computers DO NOT work in the Performa 400.

Microphone/Sound

The microphone is an electret type, omnidirectional microphone that is powered by the computer. Microphone output voltage is 4 millivolts (mV) peak-to-peak at normal speaking volume.

Note: You can also use adapters to input sound from audio equipment with line level outputs, but the line level signals must be attenuated before reaching the computer's sound input port. An attenuation of 500:1 is recommended when inputting line level signals. Appropriate attenuation cables and adapters are available from electronics stores.

System Software

At introduction, the Performa 400 ships with System Software version 7.0.1P. This version has all the functionality and power of System 7.0.1, with special enhancements for first-time users:

• Application Launcher. Provides easy location and launching of all applications while retaining full Finder access.

• Default Document Folder. Provides a default location for storing documents.

• Layer Hiding. Provides easier navigation by hiding non-active layers. Users can easily switch to the Finder or to another program from the application menu.

• At Ease. Lets adults share the Performa 400 with others, and makes it easy for children to launch applications -- while protecting the hard disk.

• Backup & Restore. An easy way to create a set of back-up disks, and to restore the contents of the hard disk if necessary.

Size and Weight

- Main Unit
  Weight: 8.8 lb. (4.0 kg)
  Height: 3.0 inches (77 mm)
  Width: 12.2 inches (310 mm)
  Depth: 15.0 inches (382 mm)
- Mouse
  Weight: 6 oz. (0.17 kg)
  Height: 1.1 inches (27.9 mm)
  Width: 2.1 inches (53.3 mm)
  Depth: 3.8 inches (96.5 mm)
- Keyboard
  Weight: 2 lb. (1 kg)
  Height: 1.8 inches (44 mm)
  Width: 16.5 inches (418 mm)
  Depth: 5.6 inches (142 mm)

Environment

- Operating temperature
  10 degrees C to 40 degrees C (50 degrees F to 104 degrees F)
- Storage temperature
  –40 degrees C to 47 degrees C (–40 degrees F to 116.6 degrees F)
- Relative humidity
  0% to 80% (noncondensing)

Altitude
  0 to 3048 m (0 to 10,000 ft.)

Article Change History:
20 Jan 93 - Revised to include 512K VRAM version and remove 256K VRAM version.
02 Nov 92 - Revised to expand display information and correct errors.
09 Nov 92 - Revised to further expand display information.

E-Machines DoubleColor SX Bundle: NuBus Adapter

Revised: 11/11/92
Security: Everyone

E-Machines DoubleColor SX Bundle: NuBus Adapter

==========

Article Created: 11 November 1992

TOPIC -----

Does the Macintosh IIsi require a NuBus adapter to work with the E-Machines DoubleColor SX Video Adapter plus Macintosh 16" Color Display bundle?

DISCUSSION -----

Apple is bundling the E-Machines DoubleColor SX Video Adapter with the Macintosh 16" Color Display. The DoubleColor SX Video Adapter provides 8-bit video (256 colors) and graphics acceleration.

A Macintosh IIsi NuBus Adapter (part number M0481LL/A) must be used to connect the DoubleColor SX Video Adapter or any other NuBus expansion card to a Macintosh IIsi.

QuickTime 1.5: Technical Overview

Revised: 8/19/96
Security: Everyone

QuickTime 1.5: Technical Overview

==========

Article Created: October 26, 1992
Article Reviewed/Updated: 19 August 1996

TOPIC ----------

QuickTime 1.5 includes support for Photo CD images. This allows applications to open PhotoYCC (Kodak's color digital image format) files as if they were Macintosh picture files. Special translators and plug-ins are not needed.

With QuickTime 1.5 and the new CD-ROM Setup 4.0 software, any AppleCD drive can read Photo CD discs:

- The new AppleCD 300 and AppleCD 300i support both single and multisession Photo CDs.

- All earlier AppleCD drives (AppleCD SC, AppleCD SC Plus, and AppleCD 150) support single session Photo CDs only.

This article describes the new features of QuickTime 1.5 that make this possible.

DISCUSSION ----------

MOVIETOOLBOX

High Level Editing

QuickTime 1.5 provides support for pasting different data types into a movie. For example, QuickDraw pictures and standard sound data can be pasted directly into a movie. If the application uses the Movie Controller, this support happens transparently and nothing needs to be changed in those applications. New support calls provide for pasting in any data type for applications that make calls to the Movie Toolbox directly to do editing.

Data Fork Movies For QuickTime 1.5

New routines are provided for storing and retrieving movies stored in the data fork of a file. These routines provide more robust data reference resolution and better low-memory performance than was possible using NewMovieFromHandle and PutMovieIntoHandle in QuickTime 1.0.

IMAGE COMPRESSION MANAGER

CompactVideo Compressor

The new CompactVideo Compressor is best suited to compressing 16-bit and 24-bit video sequences. It's a lossy algorithm that's highly asymmetrical. In other words, it takes significantly longer to compress a frame than it does to decompress that frame. Compressing a 24-bit 640x480 image on a Macintosh IIfx takes approximately 4 minutes, achieving a compression ratio of 13.5:1. Decompressing the image takes less than a second.

Compared to QuickTime's original video compressor, CompactVideo obtains higher compression ratios, better image quality, and faster playback. When used in conjunction with MovieShop, CompactVideo can constrain data rates to user-definable levels. This is particularly important when compressing material for playback from CD.

For best results, CompactVideo should be used on raw source data that has never been compressed with a highly lossy compressor before (including CompactVideo).

Alignment Calls

New window alignment calls provide a mechanism for positioning and dragging windows to optimal screen positions based on the depth of the screen. Rectangles on 1-bit and 2-bit screens are horizontally aligned to multiples of 16 pixels, 4-bit to multiples of 8, 8-bit to multiples of 4, and 16-bit to multiples of 2. Alignment on 32-bit screens only occurs on 68040-class systems or greater, and then it's to multiples of 4 pixels. When the alignment rectangle crosses more than one screen, the alignment of the strictest screen is used. Decompression to non-optimally aligned destinations can reduce performance by as much as 50%, so these calls should be used whenever possible.

The default alignment behavior will be adequate for the vast majority of cases where alignment is desired. However, when alignment characteristics specific to particular video hardware is needed, or for other reasons, default alignment can be overridden.

Changes to Standard Compression

Most of the changes to the Standard Compression dialog have been below the surface: bug fixes and better memory management in particular. Please note that movies recorded under QuickTime 1.0 won't play back under 1.5 with the improvements in screen size, faster rate, and so on. To see these

improvements, you must record under QuickTime 1.5. Here are descriptions of changes visible to the application developer and the user:

- Movie Controller
  Two new calls in the Movie Controller make it easier to deal with edit menus. And some new action flags were added to make it easier to detect and intercept clicks.

- Video Digitizers
  Support is added for digitizer cards with capabilities previously unaddressed. For example, features were added to deal with cards that can provide compressed video images directly.

- Movie Import and Export
  MovieImport and MovieExport components provide a standard way for applications to get any type of data into and out of a QuickTime movie.

  - MovieImport components take data from a file or handle and put it into a movie.

  - MovieExport components take a portion of a movie and put it into a file or handle.

  Both MovieImport and MovieExport components may have a dialog that is presented to the user to configure the translation, but the components should work even if the dialog is not displayed.

  A typical use of a MovieImport component would be to allow a user to paste a PICT from a favorite paint application into a movie. Another use would be to convert a PICS file into a QuickTime movie. A MovieExport component might be used to export the sound track of a movie to an AIFF file so that it can be edited in a non-QuickTime-aware sound-editing application.

  MovieImport components can be requested to add data to a movie in one of three ways. The caller may specify that the data go into:

  - A particular existing track.

  - A new track, created by the MovieImport component.

  - One or more existing tracks, creating new tracks if necessary

  MovieExport components can be requested to take data from either a movie, or from a single track.

- Sound Digitizers
  New selectors have been added to support the new sound input configuration dialogs supplied by the Sequence Grabber.

Article Change History:
19 Aug 1996 - Corrected misspelling.
18 Dec 1992 - Revised to include information about movie playback.

System 7: Bus Error Message After Installing

Revised: 11/9/92
Security: Everyone

System 7: Bus Error Message After Installing

==========

Article Created: 28 October 1992

TOPIC ----------

I'm getting bus error messages after installing System 7. Should I begin to look at the SCSI bus?

DISCUSSION ----------

The appearance of a bus error doesn't indicate there is a SCSI bus problem, although it doesn't exclude it either. That error could indicate a problem with ANY bus, since there are data busses internal to the processor and address and data busses external to the processor. It's best not to assume that "Bus Error" refers only to the SCSI bus when troubleshooting this problem.

MacWrite II: Locks Up on Macintosh with More Than 16MB of RAM

Revised: 11/29/92
Security: Everyone

MacWrite II: Locks Up on Macintosh with More Than 16MB of RAM

==========

Article Created: 28 October 1992

TOPIC ----------

MacWrite II 1.1v2 locks up my Quadra (20MB RAM, 32-bit addressing, cache on or off) every time I try to run the spell checker. Is this a known bug, and is there a fix?

DISCUSSION ----------

Claris Tech Support says this is a recognized problem with all versions of MacWrite II and any CPU with over 16MB of RAM. MacWrite II must load into low memory to get around this problem. One way to do this is to make the system heap 4MB or larger. This will leave 16MB of memory available, allowing MacWrite II to run properly. You can do this by increasing the RAM cache to 4MB. Another way is by loading 4MB of applications into memory before running MacWrite II.

Microsoft Word 5.0: Scrambled Menu

Revised: 11/29/92
Security: Everyone

Microsoft Word 5.0: Scrambled Menu

==========

Article Created: 28 October 1992

TOPIC ----------

After installing Microsoft Word 5.0 the menu is garbage, the icon in the top right hand corner is an inverse character, and balloon help has disappeared. Restarting with extensions off clears up the problem.

DISCUSSION ----------

According to Microsoft Tech Support, there could be an INIT conflict. Also, the Word Settings Preference file will cause garbage in menus when it's corrupted. Remove the Word Settings file to see if the problem clears up.

There have also been reports to Microsoft of MacroMaker causing this problem. Microsoft Tech Support also said that the 5.0 installer will add fonts to the System file and if there is an incompatible INIT present in the System Folder, it could interfere with the installation of 5.0. Worst scenario would be to reinstall the System after exhausting other ideas.

System 7: Quadra 900 and Tune Up Bug

Revised: 11/29/92
Security: Everyone

System 7: Quadra 900 and Tune Up Bug

==========

Article Created: 28 October 1992

TOPIC ----------

When I run my Quadra 900 as a server, without keyboard and monitor, the system hangs with the keylock in the secure position. Have you heard of this, and how can I fix it?

DISCUSSION ----------

There's a bug on the Quadra 900 with System 7 Tune Up installed that will only manifest itself in keyboardless (that is, server) environments when the keylock is in the secure (or locked) position. In this scenario, the system will hang.

If you want to benefit from the enhancements in System 7 Tune Up and still use the Quadra 900 as a keyboardless server with the keylock in the locked position, remove the System 7 Tune Up extension from the Extensions folder. Then reboot the computer.

Quadra 900 customers typically have 4MB or more DRAM in their systems and therefore the low memory conditions that the System 7 Tune Up extension addresses is much less an issue on this computer than on 2MB computers.

Without the System 7 Tune Up, choosing "About This Macintosh..." in the Apple menu will show "System Software 7.0.1" and not "System Software 7.0.1•".

You will still benefit from the other features of the System 7 Tune Up kit, such as a new Chooser, and new LaserWriter, StyleWriter and File Sharing extensions.

TrueType Fonts: Installing on Macintosh Plus with No Hard Disk

Revised: 11/29/92
Security: Everyone

TrueType Fonts: Installing on Macintosh Plus with No Hard Disk

==========

Article Created: 28 October 1992

TOPIC ----------

I have a 1MB Macintosh Plus with no hard disk, and I just purchased a StyleWriter printer. I want to print with TrueType fonts, but without a hard disk I have little room on an 800K disk. Is there a solution?

DISCUSSION ----------

Here are the steps to get TWO TrueType fonts on the disk and have about 46K left.

Follow these steps to install the minimal system software:

1) Format an 800K disk.
2) Run the install from the System 6.0.7 disk.
3) Be sure to click on Switch Disk and Eject Disk buttons as needed.
4) Insert the new formatted disk and do a minimum install for Macintosh Plus (this leaves about 435K available).

Follow these steps to install the StyleWriter software:

1) Insert the StyleWriter Installation disk.
2) Custom install for the TrueType (INIT) - 101K and the StyleWriter driver (163K).

You should now have about 150-170K available.

Follow these steps to install the individual TrueType fonts (remember that the fonts each take up 60-70K):

1) Insert the TrueType fonts disk from the StyleWriter package.
2) Open the Font/DA Mover.
3) The right window should show information (fonts) in the System file.
4) Click on Open in the right window.

5) Shift-click to select the desired fonts. (Please note at this point you probably can only select two fonts because of minimal space left on the disk.)
6) Click on Copy.
7) Restart the computer from your new startup disk.

AppleShare 3.0: Access Privileges for a User Folder

Revised: 11/9/92
Security: Everyone

AppleShare 3.0: Access Privileges for a User Folder

==========

Article Created: 28 October 1992

TOPIC -----

A client on an AppleShare 3.0 server wants to set up a folder, and then set up access privileges without involving the server administrator. How do they do that?

DISCUSSION -----

Follow these steps:

1) Create a new folder on the server.
2) Select the folder.
3) Under System 7: Select Sharing under the File menu.
4) Under System 6: Select Get Privileges under the File menu.

This brings up a dialog box which will allow you to set up access privileges for that folder.

System 7.0.1: System Crashes with 68000 Accelerators

==========

Article Created: 28 October 1992

TOPIC ----------

I have an accelerator card with a 68020 installed in my Macintosh Plus. After installing System 7.0.1, I'm getting system crashes at start up. What's happening?

DISCUSSION ----------

There's code that causes problems on 68000 computers with 68020/68030 accelerators. This same problem afflicts the 7.0 Tune Up. A different implementation works fine in 7.0. But neither the 7.0, nor the 7.0.1 version would handle a case of a 68000 accelerated by a 68040.

This code has some other problems. Apparently SwapSerialClock is a valid selector on 68000 computers, but on an accelerated 68000 computer there's no way to call it. Presumably, if the table gets set up correctly, it would solve this problem.

Finally, there's a related problem. The 7.0.1 implementation of FlushInstructionCache (_HWPriv with a selector of 1) just calls jFlushCache. This simplifies things since there's only one implementation of FlushInstructionCache to worry about. But vCacheFlush is never patched correctly if a different CPU from the one supported by the ROM is installed.

The table of selector functions is referenced by the instruction:

```
  MOVE.L  emHwPrivTable(A0),A0; Point A0 to the hwPriv jump vector table
```

It appears that such a table never gets set up on 68000 computers. In the following instruction, the immediate value #0 gets updated with the correct value for the size of the table.

```
  SelectorNum CMPI.W #0,D0   ; Is the selector in range? (gets filled in
```

```
  at install time)

Since CPUFlag indicates we're no longer running on a 68000 computer,
it falls through to the preceding instruction.  Because no table gets
installed, the instruction determines that the selector is out of range,
and branches off to tryTheROM.  Since there's no HWPriv in ROM on an SE,
for example, this defaults to _Unimplemented.
```

LaserWriter Driver 7.1: Incompatible with NetWare Print Services

Revised: 11/29/92
Security: Everyone

LaserWriter Driver 7.1: Incompatible with NetWare Print Services

==========

Article Created: 28 October 1992

TOPIC -----

Novell describes a compatibility problem with the LaserWriter 7.1 driver. This information will ship with future versions of NetWare, and is also the information that Novell is giving to customers.

The recommendation is that Novell users of NetWare for Macintosh Print Services (v3.x) remove the 7.1 driver and use the 7.0 driver. If other problems arise, customers should call Novell.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

DISCUSSION -----

NetWare for Macintosh Print Services have serious compatibility problems with Apple's new LaserWriter v7.1 rDev. ATPS.NLM, the print services module of NetWare for Macintosh 3.x, IS compatible with LaserWriter v.5.x, 6.x, and 7.0. The 7.1 problems are evidenced as follows:

1) Jobs printed to the ATPS print spooler from Macintosh computers using the LaserWriter 7.1 rDev will fail to print due to a PostScript Error. The message returned by the printer via ATPS is:

   %%[Error: syntaxerror; Offending Command: --nostringval--]%%

   The offending command may also be gibberish.

   There is no known workaround for this problem, which affects ATPS.NLM v3.1, shipped with NetWare for Macintosh 3.01. Until it is addressed, Novell recommends NetWare for Macintosh customers user LaserWriter 7.0 in preference to 7.1.

2) A secondary problem is caused if a Macintosh using the LaserWriter 7.1 rDev prints to the server before anyone has ever printed using the 7.0 rDev. It's symptom is that all the print jobs produced by LaserWriter 7.0 or 7.1 printed by the ATPS print server will fail, and ATPS will return the message:

```
printer <printername> returned bad dictionary status: %%[
Error:timeout;
Offending Command: timeout ]%%
PAP write: no such device or address
```

This occurs because ATPS makes an incomplete copy of the 7.x ProcSet Query from the Macintosh client printing with LaserWriter 7.1.

This problem affects ATPS.NLM v3.1, shipped with NetWare for Macintosh v3.01. To correct it permanently, go to the ATPS directory on the server (default:SYS:SYSTEM\ATPS) and erase the file containing the query (APP710.QRY). Now print to the ATPS print spooler with the LaserWriter 7.0 rDev to create a complete query file on the server.

AppleShare 3.0: Server Crashes Caused by Virex

==========

Article Created: 28 October 1992

TOPIC -----

A customer using AppleShare 3.0 is experiencing server crashes.

DISCUSSION -----

Virex 3.6 and 3.8 is incompatible with AppleShare 3.0, and causes server crashes. These virus programs should be removed.

AppleShare: Switch Launching Over 3Com Networks

==========

Article Created: 28 October 1992

TOPIC --

I've heard that Switch Launching can be done over the network if I have a 3Com card installed in my Macintosh. Is this true?

DISCUSSION --

"Switch Launching" is available over LocalTalk or Ethernet for the indicated versions:

- 3Com's System 6.0.X Apple Workstation Software and
  - 3+Share File Server (1.2.1 through 1.6.1) - Supported
  - 3+Open File Server (All versions) - Supported
  - AppleShare File Server (All versions) - NOT Supported

- 3Com's System 7.0.X Apple Workstation Software and
  - 3+Share File Server (All versions) - NOT Supported
  - 3+Open File Server (All versions) - NOT Supported
  - AppleShare File Server (All versions) - NOT Supported

(This is noted on a small piece of paper provided with the 3+Open Administrator software and update guide or it will be relayed by a 3Com Support Technician if you call 3Com for support.)

AppleShare 3.0: Workstation Software Disk Space

Revised: 11/25/92
Security: Everyone

AppleShare 3.0: Workstation Software Disk Space

==========

Article Created: 28 October 1992

TOPIC ----------

How much room does Workstation 3.0 software take compared to Workstation software 2.0 with regard to disk space? This is important because I use Macintosh Plus computers with 800K floppy disks, and every bit of space is important.

DISCUSSION ----------

We tested three versions of AppleShare, configured on an 800K floppy disk with System 6.0.7 minimal install of software for any Macintosh:

System Folder size is 599K:

- AppleShare 2.0.1 - 45K
- AppleShare 2.0.2 - 44K
- AppleShare 3.0 - 74K

Based on these figures, AppleShare 3.0 workstation software occupies about 30K more than versions of 2.0 workstation software.

AppleShare 3.0: Remote User Activity Performance Test

Revised: 11/25/92
Security: Everyone

AppleShare 3.0: Remote User Activity Performance Test

==========

Article Created: 28 October 1992

TOPIC ----------

Does adjusting the Remote User Activity in the AppleShare File Server affect the performance of files being copied on a network? Is there any way of telling how much performance is affected?

DISCUSSION ----------

Adjusting the Remote User Activity does affect the File Server, dramatically in some cases. A test involving a limited network produced the following results:

The network consisted of:

- Server - Macintosh Plus with 4 Megabytes of RAM running System 7.0 and an AppleShare File Server only (no extensions or applications running).

- Client - Macintosh Plus with 4 Megabytes of RAM running System 6.0.8 with no application or INITs running.

Both computers were networked using PhoneNet cabling. They were the only computers on the network. A folder containing 1 Megabyte exactly was used. The file was copied from the server to the client.

Here are the test times:

Remote User Activity set at:
10% = 4 minutes and 50 seconds
50% = 2 minutes and 00 seconds
100% = 1 minute and 22 seconds

As you can see the speed difference varies between 10% to 100%.

Note: Times may vary depending upon configuration and CPU used.

AppleShare 3.0: Users & Groups File Damaged On Upgrade (6/95)

Revised: 6/9/95
Security: Everyone

AppleShare 3.0: Users & Groups File Damaged On Upgrade (6/95)

==========

Article Created: 28 October 1992
Article Reviewed/Updated: 9 June 1995

TOPIC ----------

I just completed an upgrade to AppleShare 3.0, and I discovered that my Users and Groups file was damaged during the upgrade. Why did this happen?

DISCUSSION ----------

As part of the 2.0 to 3.0 upgrade, 3.0 is designed to replace 2.0's explicit access privileges with inherited privileges for any folder whose access privileges are the same as those of the folder's parent. Unfortunately, the code which determines whether inherit privileges are appropriate, only checks that the access privileges check box matrix matches, not that the folder is owned by the same user and used by the same group. The end result is that, after upgrade, some folders' access privileges will have inherited privileges and be reassigned to other Users and Groups.

Admin's "Compact Volume Access Privileges" menu item calls the same code that does the 2.0 to 3.0 upgrade. It will result in the same bug: Incorrect assignment of inherited privileges for folders whose parent folder has different access privileges.

Here are definitions for explicit and inherit access privileges:

Explicit - Retain access privileges regardless of the enclosing folder.
Inherit - Always change to reflect access privileges of enclosing folder.

The default on an AppleShare Server is explicit.

Article Change History:
09 Jun 1995 - Added definition for explicit and inherit.

PowerBook Drives: DOS Mounter and Disk Noise (4/94)

==========

Article Created: 28 October 1992
Article Reviewed/Updated: 1 April 1994

TOPIC ----------

My PowerBook disk drive makes strange noises when it's reading a disk. I installed DOS Mounter and everything was fine until I mounted my first DOS disk. Since then, the drive has made this strange (and loud) noise. What's wrong?

DISCUSSION ----------

According to Dayna Communications tech support, the stepping routine for the drive is stored in PRAM. While the noises are normal, they are only supposed to happen when the drive is reading a DOS disk. Unfortunately, the stepping routine is supposed to return to its default for normal Macintosh operating system disks, but it doesn't.

Dayna Communications fixed this problem as of version 3.02 of DOS Mounter. DOS Mounter 3.02 or greater -- including DOS Mounter Plus -- will correctly reset the stepping routine.

To locate a vendor's address and phone number, use the vendor name as a search string.

AppleShare 3.0: What the WorkStation Installer Updates (4/94)

==========

Article Created: 28 October 1992
Article Reviewed/Updated: 1 April 1994

TOPIC ----------

I have a question about the installation of the new Client software for AppleShare 3.0. Does the Installer actually install any resources INTO the System file or into any other file?

DISCUSSION ----------

In general the only thing that happens during the installation of the AppleShare 3.0 workstation software is that the AppleShare file is copied into the Extensions folder. However, if the system has been updated from a version of system software prior to 6.0.3 and hasn't had AppleShare workstation software installed, it's necessary to update some of the AppleTalk files.

The recommendation is that if you fit these criteria, go ahead and use the drag install. If problems arise on that workstation, use the Installer provided.

Macintosh Color Display: How Its Size Is Measured

==========

Article Created: 3 November 1992

TOPIC ----------

How does Apple measure the Macintosh Color Display?

DISCUSSION ----------

The Macintosh Color Display measures approximately 14 inches from corner to corner of the CRT (with the front bezel removed). This is the industry-standard method of measuring displays, and all display vendors call this CRT size a 14" display.

Apple formerly measured its displays from inside corner to inside corner of the front bezel. By this measurement, the Macintosh Color Display and the previous AppleColor High-Resolution RGB Display measure approximately 13".

PowerBook and External Hard Drive: SCSI Termination Problem

Revised: 10/30/92
Security: Everyone

PowerBook and External Hard Drive: SCSI Termination Problem

==========

Article Created: October 30, 1992

TOPIC ----------

When I use my third-party external hard drive with my desktop Macintosh, I can trash the hard drive and then power it off without a problem. But when I do the same thing on my Powerbook 170, as soon as I power down the hard drive, the PowerBook hangs.

DISCUSSION ----------

The problem is the lack of SCSI termination power. The Macintosh Plus, Macintosh Portable, and Macintosh Powerbooks do not provide SCSI termination power. In the scenario you describe, it is the external hard drive providing the appropriate termination, since all Apple hard drives (and some third-party hard drives) provide termination power. Much like signal termination on a network, once it is removed (as when you power down the HD) the SCSI bus loses its integrity and the PowerBook crashes.

PowerBook 160: Specifications (Discontinued 9/13/93)

==========

Article Created: 19 October 1992
Article Reviewed/Updated: 19 February 1993

TOPIC ----------

This article provides the technical specifications for the Macintosh PowerBook 160 notebook computer.

DISCUSSION ----------

Microprocessor

• 68030, running at 25 MHz.

Address and Data Bus

32-bit Address Bus
32-bit Data Bus

RAM

• Comes with 4MB pseudostatic RAM on the logic board.

• Expandable to 14MB with expansion PSRAM cards.

Storage

• One built-in 1.4MB Apple SuperDrive disk drive that uses high-density floppy disks; it reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks.

• One internal 40MB, 80MB, or 120MB hard disk.

Display

- 10 in. (254 mm) diagonal backlit supertwist liquid-crystal display.

- 16 shades of gray, 640 x 400 pixels

- Built-in support for up to 256 colors on a variety of external displays, including:
  Macintosh 12" Monochrome Display
  Macintosh 12" RGB Display
  AppleColor High Resolution RGB Display
  Macintosh Color Display
  Macintosh 16" Color Display
  Macintosh Portrait Display
  Some VGA and SVGA monitors

- Two video-out modes:

  1) Video mirroring for simultaneous display of the same image on two screens.

  2) Dual display for full use of both screens.

Battery

- NiCad (nickel-cadmium), provides 2.5 to 3 hours of use before recharging is necessary. (AC power adapter is included.)

Keyboard and Trackball

- Built-in keyboard with standard Macintosh layout and two-level tilt adjustment.

- Dual-button trackball, 30 mm diameter.

Clock/Calendar

- CMOS custom chip with long-life lithium battery.

Microphone

- Built-in omnidirectional; output voltage is 4 mV, peak to peak, at normal volume

Interfaces

- One Apple Desktop Bus (ADB) port for keyboard, mouse, and other devices.

- Two RS-422 serial ports for LocalTalk networking, printers, modems, and other devices.

- One HDI-30 SCSI port for hard disks, scanners, CD-ROM drives, and other devices.

- One slot for optional modem.

- One video-out port, supporting 8 bit/256 colors.

- One sound output port for external audio amplifier.

- One sound-in port.

- Security slot for use with third-party equipment to lock the computer.

Modem

- Optional internal PowerBook Express Modem; 14,400 bits per second (bps) data with fax send and receive at 9600 bps; includes Express Fax software.

- Optional internal 2400 bps modem with fax send at 9600 bps; includes fax send software.

Sound Generator

- Apple Sound Chip provides 8-bit sound, capable of driving stereo headphones or other stereo equipment through the sound port.

Sound Input

- 8-bit sound, sampled at 11 or 22 kHz.

Disability Access

- CloseView, Easy Access, and visible beep included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disabilities.

ADB Power Requirements

- Maximum current draw for all ADB devices is 200 milliamps (a maximum of three ADB devices is recommended)

Electrical Requirements

- Line voltage: 100 to 240 volts

- Frequency: 50 to 60 Hz

Environmental Requirements

- Operating temperature: 50 to 104° F (10 to 40° C)

- Storage Temperature: -40 to 65° C (-40 to 148° F)

- Relative humidity: 20% to 80% noncondensing

- Altitude: 0 to 15,000 ft. (0 to 4722 m)

• Operating altitude: 0 to 10,000 ft. (0 to 3048 m)

Size and Weight

• Height: 2.25 in. (5.7 cm)

• Width: 11.25 in. (28.6 cm)

• Depth: 9.3 in. (23.6 cm)

• Weight: 6.8 lb. (3.1 kg)

Noise Level

Noise free except for disk drive use.

Article Change History:
4 June 1992 - Updated to correct voltage specification.
19 February 1993 - Updated to correct storage temperature range.

System 7: Retaining AppleShare Access Privileges at Install

Revised: 9/23/93
Security: Everyone

System 7: Retaining AppleShare Access Privileges at Install

==========

Article Created: 30 October 1992
Article Reviewed/Updated: 23 September 1993

TOPIC ----------

Is there a way to reinstall System 7.x and retain the folder privileges assigned in AppleShare 3.0.x?

DISCUSSION ----------

Yes. After installing a new System Folder, or even a system file of 7.0.x, you MUST go to "Sharing Setup" in the Control Panels and name your Macintosh BEFORE launching the Admin program. The "Macintosh Name" will be the name of the Server, and can be named anything.

There are three things to watch for to retain privileges:

1) Make sure the Volume names haven't been changed.

2) If installing a new System 7.x folder and AppleShare 3.0.x, remember to drag the System 7.x Users and Groups data file from the Preferences folder into the trash. Drag the saved 3.0.x Users and Groups file into the Preferences folder and restart the Macintosh.

3) MAKE SURE to open "Sharing Setup" in the control panel and set the "Macintosh Name:" field to the server name you want to use, BEFORE launching the Admin Program.

AppleShare 1.x or 2.0x: Forgotten Admin Key

Revised: 11/29/92
Security: Everyone

AppleShare 1.x or 2.0x: Forgotten Admin Key

==========

Article Created: 30 October 1992

TOPIC ----------

I'm an Administrator, and I forgot my AppleShare Admin Key.

DISCUSSION ----------

For AppleShare 1.0 or 1.1 see page 137, chapter 6, in the "AppleShare Administrator's Guide" (Apple Part #030-1343-A).

Here are the steps on page 137:

WARNING: Before you use this procedure, make sure that you have a backup copy of the Users & Groups file. See "Backing Up Users and Groups Lists" in Chapter 2 for more information.

1) Use the "AppleShare Server Installer" disk to start up the server's Macintosh Plus.

2) While in the Finder, locate the Users & Groups file in the Server folder of the startup volume, drag it to the trash, and choose Empty Trash from the Special menu.

3) Open the AppleShare Admin application.

4) Select the same startup volume that you had before.

5) When you're asked to select a Users & Groups file, select the backup copy of the Users & Groups file.

Click Volume until you see the disk name. Click Eject to insert another disk. If necessary, open any folders in the list until you see the backup copy of the file. Select the file and click Open.

6) When asked, type the server name and the new Admin key.

7) Continue to follow the procedure for preparing the server.

See "Installing AppleShare Server Software" in Chapter 4 for more information.

For AppleShare 2.0 or 2.0.1 File Server, see page 204, chapter 7, in the "AppleShare File Server Administrator's Guide" (Apple Part # 030-1343-B).

Here are the steps on Page 204:

WARNING: Before you use this procedure, make sure you have a backup copy of the Users & Groups file.

1) Use the "Server Administration" disk to start up the server's Macintosh.

2) While in the Finder, locate the Users & Groups file in the Server folder of the startup volume, drag it to the trash, and choose Empty Trash from the Special menu.

3) Open the AppleShare Admin application.

4) Prepare the same startup volume you had before.

5) When you're asked to select a Users & Groups file, select the backup copy of the Users & Groups file.

Click Volume until you see the disk name. (If necessary, click Eject and then insert another disk.) Open any necessary folders in the list until you see the backup copy of the file. Select the file and click Open.

6) When asked, type the new Admin key.

7) Continue to follow the procedure for preparing the server.

See "Installing AppleShare File Server Software" in Chapter 5 for more information.

AppleShare 3.0: New Users Don't Appear in Aristotle Menu (4/94)

Revised: 4/1/94
Security: Everyone

AppleShare 3.0: New Users Don't Appear in Aristotle Menu (4/94)

==========

Article Created: 30 October 1992
Article Reviewed/Updated: 1 April 1994

TOPIC ----------

Within AppleShare 3.0, I can create new users on the server, but they don't appear in the Aristotle menu. How can I make this happen?

DISCUSSION ----------

AppleShare 2.0.1

Here's what works in AppleShare 2.0.1:

1) Create user "Joe".

2) Make "Joe's" primary group "Student".
   Admin automatically assigns "Student" to the "User/Group:" field of the folder "Joe".

3) Aristotle can now build a user list that includes "Joe".

AppleShare 3.0 and 3.0.1

Here's information about the problem with AppleShare 3 and Aristotle. Step 4 didn't work until we threw away the Users folder and let AppleShare create a new one when Apple II Startup was enabled.

Here's the bug:

1) Create user "Joe".

2) Make "Joe's" primary group "Student"
   All is well, except Admin will have FAILED to update the "User/Group:" field of the folder "Joe"!

4) Workaround: Select Joe and do a "Verify Apple II Startup Info..." from the startup menu. Click "Yes" when asked if you want to "Reset Access Privileges to allow Apple II startup...". The folder "Joe" will now have its "User/Group:" field set to "Student". Aristotle can now see "Joe".

5) Supplemental 3.0 bug: Whenever the "Verify Apple II Startup Info..." menu is used (as in the above workaround), it MAY change the "Users" folder to have "Same As Enclosing Folder" access privileges. You can check and correct this by looking at the "Users" folder using the "Access Information..." dialog. The "Users" folder must have the "See Folders" checkbox checked for "Everyone:" to allow Apple II startup.

To make the workaround as easy as possible, we suggest the following steps:

1) Make sure "Everyone:" has at least "See Folders" access to the root of the primary volume in the "Access Information..." dialog. ("See Folders" AND "See Files" is even better.)

2) Create all users and assign their primary group to "Student" as each is created.

3) After all users have been created, select "Student" in the group list and do the "Verify Apple II Startup Info..." answering "Yes" when asked if you want access privileges reset. (Doing "Verify Apple II Startup Info..." for a single group rather than each individual user is a big time and step saver.)

4) When verification is complete, set the "Users" folder so that the "See Folders" checkbox for "Everyone:" is set in the "Access Information..." dialog.

System 7: Causes for VM to Disappear from About This Macintosh

Revised: 1/7/93
Security: Everyone

System 7: Causes for VM to Disappear from "About This Macintosh"

==========

Article Created: 10 December 1992

Article Change History

01/07/93 - REVISED
- To add another situation that causes VM to disappear.

TOPIC ----------

I'm using Virtual Memory, but it no longer shows up under "About this Macintosh."

DISCUSSION ----------

A couple of situations can cause Virtual Memory to disappear from "About this Macintosh" under the Apple menu.

If you lock or copy protect the VM Storage file from the Preferences menu in AppleShare Admin when you use Virtual Memory on a server, you lose Virtual Memory.

Also, if you rename the hard disk designated as Virtual Memory storage, you lose the VM. This doesn't damage anything, but you won't have Virtual Memory. There are two workarounds:

1) Rename the hard disk to its original name,

or

2) Open and close the Memory control panel, then restart. This option apparently rewrites the correct information to the system.

AppleShare: Trashed Item from Server Remains in Window

Revised: 11/29/92
Security: Everyone

AppleShare: Trashed Item from Server Remains in Window

==========

Article Created: 2 November 1992

TOPIC -----

Sometimes when I drag something to the trash that resides on an AppleShare server, I get the message "Filename cannot be left in the trash. Do you want to delete it immediately?" And, if I click OK to delete the item, the icon for the item remains in the window until closing and reopening it. Why does this happen?

DISCUSSION -----

This happens when you have write access to a folder, but not the whole volume that the folder resides on. For some reason, AppleShare needs write access to the whole volume to create the Network Trash Folder (which is invisible).

To reproduce, share a volume and don't give write access to the top level of the volume. Give write access to a folder inside the volume. Then log on and try to trash something from within the folder.

WORKAROUND: Have the Administrator give the client write access to the root level of the volume. Then have the client delete an item. No dialog comes up, as the client has write access to create the Network Trash Folder.

But if you want to keep the same access, you'll end up with the above message.

System 7: System Magic Works On Folders

Revised: 11/29/92
Security: Everyone

System 7: System Magic Works On Folders

==========

Article Created: 2 November 1992

TOPIC ----------

Will the System magic work on folders dragged to the System Folder?

DISCUSSION ----------

YES, the System magic will work on folders! Just drag a folder full of fonts, suitcases, control panels, or extensions and the System will route the items to the appropriate subfolder. It will look one level deep.

NOTE: If the folder contains only suitcases, after moving the fonts and DAs you'll see an error message for each suitcase and folder. The message says that the item couldn't be deleted because it contains items that are in use. Then it deletes the suitcases, but the folder remains.

System 7: Spooling Options and Print Server Options

Revised: 7/26/93
Security: Everyone

System 7: Spooling Options and Print Server Options

==========

Article Created: 2 November 1992
Article Reviewed/Updated: 22 July 1993

TOPIC ----------

Are there any alternatives to PrintMonitor and/or the AppleShare print server?

DISCUSSION ----------

Yes. SuperLaserSpool from 5th Generation Systems will do background printing to LaserWriters and all the ImageWriters and HP LaserJets, DeskJets and DeskWriters. It also includes the desk accessory, LaserQueue, that lets you preview and prioritize documents, re-route them to other printers, or print to several printers simultaneously.

Print Central is an "enhanced" Print Server from Compumation Inc. It includes printer load balancing, an authorized user list, remote status and control, and redirection of print jobs to other printers. They also have an enhanced Print Central called Color Central. Color Central allows you to use low-resolution art files in your documents, but print corresponding high-resolution graphics that are stored on the server.

Blue Parrot from Casa Blanca Works Inc. is a control panel that displays the print queue for any networked printer in your zone. For it to work effectively, all Macintosh computers that print must run copies of the program.

Other multi-user print servers include:

- PServe from CoOperative Printing Solutions Inc.
- QSpool from Baseview Products Inc.
- SpeedDriver from Digital Technology International

Other single-user print spoolers include:

- MacTOPS from Sun Select (formerly Sitka Corp.)
- TurboSpool from PLI

To locate a vendor's address and phone numbers, use the vendor name as a search string.

AppleShare 3.0, 3.0.1: Copying Locked files on Server (4/94)

==========

Article Created: 10 December 1992
Article Change History: 1 April 1994

TOPIC -----

If I try to duplicate a locked file with AppleShare 3.0 File Server running, I get the message: "The file 'filename' couldn't be written, because you do not have enough access privileges. Do you want to continue copying?"

DISCUSSION -----

This is an issue. The workarounds are:

- Unlock the file from either the Privileges menu in the Admin application, or the Get Info window in the finder.

- Duplicate from a workstation.

- Shut down the AppleShare server.

Macintosh: Holding Spooled Print Jobs

==========

Article Created: 3 December 1992

TOPIC --------------------

Can I spool print jobs (using Print Monitor) and hold them for printing at a later time?

DISCUSSION --------------------

Yes. Before printing, open Print Monitor by double-clicking on the application (in the Extensions folder). When it's open, select "stop printing" from the File menu. Leave the window open and print the jobs you want. They will line up in the window. When you want to send them to the printer, just select "resume printing" from the file menu or select each job and set a print time, then select "resume printing."

System 7: Running QuickMail and AppleShare 3.0

Revised: 12/7/92
Security: Everyone

System 7: Running QuickMail and AppleShare 3.0

==========

Article Created: 3 December 1992

TOPIC ----------

Is there a problem running QuickMail and System 7 and AppleShare 3.0 on the same computer?

DISCUSSION ----------

There are two problems:

- The QuickMail NameServer (a Control Panel that scans the network and updates the database of QuickMail users) is erratic on a computer running AppleShare 3.0.

- If you have AppleShare Print Server and QuickMail running on the same computer, you get Fatal Errors from the Print Server. BUT, running just QuickMail (without NameServer) and AppleShare 3.0 worked fine in our testing. Please be aware that actual server usage varies from site-to-site..

Here is the official statement from the Technical Support Group, CE Software, Inc.

"AppleShare Server 3.0, which includes both file and print servers, is incompatible with the QuickMail mail server.

"This means that customers cannot use the same Macintosh computer as both an AppleShare 3.0 and QuickMail server. This incompatibility affects all versions of the QuickMail server from 2.2.x to 2.5.1. This is the same incompatibility that prevents using the QM Server and System 7.0 Personal File Sharing on the same machine. Customers who use AppleShare Server 2.01 and earlier in conjunction with the QM Server will not experience any problems.

"This problem does not effect AppleShare Server machines that operate as QuickMail clients, nor does it effect machines that act as AppleShare server clients and QuickMail clients.

CE Software recommends that any customer who needs to use both AppleShare 3.0 (and Print Server) and QuickMail run these servers on separate machines unless you have obtained a copy of AppleShare AppleShare Server 3.0.1, which corrects the problem."

To locate a vendor's address and phone numbers, use the vendor name as a search string.

AppleShare 3.0: Installing Over the Network

Revised: 12/7/92
Security: Everyone

AppleShare 3.0: Installing Over the Network

==========

Article Created: 4 December 1992

TOPIC ----------

The AppleShare 3.0 Administrator's Guide, on page 161, says to do a live install from either a System 7 or a System 6 computer. After telling the Installer which files I'll need and clicking on the Install button, I get this error message: "The files needed for this installation could not be found on your server volume 'server name'. Please contact your network administrator."

DISCUSSION ----------

A live installation can actually be done, but there's an error in the manual. It says to name the workstation software folder on the server "AppleShare". The Installer is looking for an "AppleShare Workstation" folder or disk and can't complete the installation. Please rename the folder "AppleShare Workstation".

Macintosh: Printing Incompatibility with Irwin Accelerator

==========

Article Created: 4 December 1992

TOPIC ----------

I can see my printer in the Chooser and can select it, but when I print, the system can't find the printer. I'm using a Macintosh SE with an Irwin Magnetics Accelerator 20/25.

DISCUSSION ----------

Irwin Magnetics confirmed the card isn't compatible. The easy solution is to disable it from the control panel.

However, they did mention that one of their customers made some custom changes to their own control panel and released it as shareware that supposedly takes care of the problem. They said it could be downloaded from America Online or CompuServe.

System 7.x: Generic Icons After Installing (8/95)

Revised: 8/31/95
Security: Everyone

System 7.x: Generic Icons After Installing (8/95)

==========

Article Created: 4 December 1992
Article Reviewed/Updated: 31 August 1995

TOPIC ----------

You upgrade to System 7.x and complete the installation successfully. But when you restart, you find that all your icons (including system extensions, Control Panels, and applications) look generic. Disk First Aid says no repair is necessary. Everything seems to be there, and the Macintosh boots with no problems. Rebuilding the desktop does nothing. What's going on?

DISCUSSION ----------

==========
System 7.5
==========

This problem seems to occur with v7.5 system software when you install from the new v2.0 CD. This is also a problem with any newly produced Power Macintosh systems with v7.5 software installed on the Apple hard drive. You get generic icons after a desktop rebuild.

The reason the generic icons appear is because the bundle bits on the Apple v2.0 CD are set incorrectly. When you install from this CD, the installed system file has its bundle bit turned off (it should be on) and the system enabler has its bundle bit turned on (it should be off).

Workaround
==========
If you cannot download the System 7.5 Update 1.0 at this time, but still want to fix the problem temporarily, you can try rebuilding the desktop after starting with extensions off. To do this:

Step 1

Restart your Macintosh while holding down the shift key.

Step 2

Continue holding the shift key until you see the "Welcome to Macintosh, Extensions off" Screen.

Step 3

Let go of the shift key and hold down the option and command keys simultaneously.

Step 4

Click "Okay" when the message "Are sure you want to rebuild the desktop file..." appears.

If rebuilding the desktop with the hard drive as the startup disk does not work, try rebuilding the desktop while booting from Disk Tools or System CD.

If you still have generic icons and you have a disk editor like Norton, MacTools, or ResEdit, simply turn the bundle bits on (system) and off (enabler), as described above, and rebuild your desktop file. You will be able to have the system enabler installed and get properly displayed icons.

Solution
========
Install the System 7.5 Update 1.0 to correct the issue.

These articles can help you locate the System 7.5 Update 1.0 mentioned here:

- Where To Find Apple Software Updates
  Lists online services for "free" Apple software updates.

- Obtaining Apple Product Support in the USA
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

NOTE:
This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

System 7
========

On older versions of System 7, the problem is most likely that there was enough room on the hard disk to successfully install the system software, but not enough room to build the desktop correctly.

The solution is to move or delete some files to make more room on the hard disk and rebuild the desktop. You will find that all of your icons are restored.

Article Change History:
31 Aug 1995 - Added information about solution.
27 Jun 1995 - Added information about newer enablers.
28 Apr 1995 - Added information about rebuilding desktop while booting from CD or floppy.

AppleShare: Excel 2.2 Can't See Files in Subfolders

Revised: 12/7/92
Security: Everyone

AppleShare: Excel 2.2 Can't See Files in Subfolders

==========

Article Created: 4 December 1992

TOPIC --

An AppleShare file server version 2.0.1 has an Excel spreadsheet buried in folders three levels deep. Everyone can see the files. One client can't open the Excel file, but can see it and copy it to the hard disk, and then open it. The client can open the file from a different computer using his password and access privileges -- so it isn't an access issue with AppleShare. He can also open the file if it's moved up one folder level on the server.

What is going on here?

DISCUSSION --

This can occur if you're using Excel 2.2. Excel can't see a file when it's more than two levels deep. Upgrading to Excel 2.2a fixes the problem.

PowerBook 160 &180: Use New AC Adapter and Battery (3/95)

Revised: 3/31/95
Security: Everyone

PowerBook 160 &180: Use New AC Adapter and Battery (3/95)

==========

Article Created: 30 October 1992
Article Reviewed/Updated: 31 March 1995

TOPIC ----------

This article explains why the use of 15 wat power adapters is not recommended for PowerBook computers that require higher wattage adapters.

DISCUSSION ----------

The Macintosh PowerBook Rechargeable Battery (M5545LL/A) is only a 2.5 amp/hour battery, whereas the new "universal" battery, the Macintosh PowerBook Rechargeable Battery M5545LL/"B" (for the PowerBook 140, 145, 160, 170, and 180) is a 2.8 amp/hour battery. If the older battery is used on the PowerBook 160 and 180, there will be shorter operating life -- in the range of 1.5 hours or less.

The Macintosh PowerBook AC Adapter (M1058LL/A) is also not recommended for use on the new PowerBook 160 and 180 because it outputs only 15 watts, compared to the new AC adapter (M4660LL/A), which outputs 19 watts. If the older AC adapter is used with the PowerBook 160 or 180, the internal battery at the very least will not charge, and at worst will drain while the PowerBook is being used. The lower wattage on the original adapter does not allow for video out (no external monitors can be used).

The new AC adapter can be used with full functionality on the previous PowerBook computers.

A/UX: Unable to Use vi with DGD200 Terminal Emulation (9/94)

Revised: 9/27/94
Security: Everyone

A/UX: Unable to Use vi with DGD200 Terminal Emulation (9/94)

==========

Article Created: 30 October 1992
Article Reviewed/Updated: 27 September 1994

TOPIC ----------

I have a Data General terminal connected to a Macintosh running A/UX 3.0. I set the terminal type to be d200 in the /etc/ttytype file; my TERM, then, is set to dgd200. However, when I try to edit a file in vi, I get an error that vi doesn't know what a DGD200 is, and I'm unable to use vi. What should I do to eliminate this problem?

DISCUSSION ----------

The problem is the 'vi' application uses the System V terminfo database (not termcap) entry to do terminal emulation, and the 'dgd200' entry doesn't appear in the /usr/lib/terminfo/d directory. The 'dgd200' termcap entry does exist in /etc/termcap though.

Fortunately, there is a public domain utility program called "captoinfo" that converts a termcap database file to a terminfo source file. It reads the termcap file from standard input and writes the terminfo source to standard output. After converting to the terminfo source file, you then use 'tic' to translate it into the compiled format file. For example:

```
captoinfo < dgd200.cap > dgd200
tic dgd200
```

The dgd200 terminfo entry will be automatically put in the /usr/lib/terminfo/d directory.

The "captoinfo" utility has been posted to www.info.apple.com. Here is the URL:

```
ftp://ftp.info.apple.com/Apple.Support.Area/Extras/AUX/captoinfo.Z
```

Article Change History:

27 Sep 1994 - Updated article to show where to get the "captoinfo"
utility.

A/UX: How Disk Space is Partitioned

Revised: 10/28/92
Security: Everyone

A/UX: How Disk Space is Partitioned

==========

Article Created: 28 October 1992

TOPIC ----------

On a preinstalled A/UX system with a 400M drive, only about about 200 megabytes of disk space can be seen. Where's the rest of the disk space?

DISCUSSION ----------

By default, the 400M drive includes the following partitions with these approximate sizes:

```
     16K   MacDriver
      3M   Autorecovery
     18M   Swap
      4M   MacPartition
     160M  Root & Usr slice 0
     200M  Free UNIX slice 3
```

On a preinstalled A/UX system slice 3 is not mounted. To verify this, use the "df -B" command. You should see output similar to the following:

```
     Filesystem              kbytes    used      avail     %used  Mounted on
    /dev/dsk/c0d0s0   112311   90997   15698   85%       /
```

In the above output, "/dev/dsk/c0d0s0" refers to slice 0 on the device with scsi id (controller) 0.

To mount the other partition, first login as root. Next, create a directory to mount the slice 3 filesystem onto, such as:

```
     mkdir /slice3
```

(/slice3 is an example name; this can be any name that doesn't already exist.) Then, edit the /etc/fstab file and add the line:

```
     /dev/dsk/c0d0s3 /slice3 4.2 rw 1 1
```

where the controller/scsi id matches that of slice 0 from the "df" command output. After saving the changed /etc/fstab file, mount the filesystem:

```
     mount /slice3
```

If any errors show up, then there is probably a "typo" in the /etc/fstab file. If no errors appear, verify that the filesystem is mounted using the "df -B"

command.
The slice 3 filesystem will now be automatically mounted when the system is rebooted.

A/UX: bad sblock magic number Error When Backing Up

Revised: 11/11/92
Security: Everyone

A/UX: "bad sblock magic number" Error When Backing Up

==========

Article Created: 28 October 1992

TOPIC ----------

When creating a backup of an A/UX filesystem, I get the following message:

```
  DUMP: bad sblock magic number
  DUMP: The ENTIRE dump is aborted.
```

DISCUSSION ----------

The dump.bsd command takes as its last argument the raw device file, rather than a block device (directory name). For all filesystems except the root filesystem, dump.bsd will look up the block device in /etc/fstab and use the raw device file listed there.

This error can be reproduced as follows:

```
# dump.bsd 0f /dev/null /
  DUMP: Date of this level 0 dump: Wed Oct 21 12:29:00 1992
  DUMP: Date of last level 0 dump: the epoch
  DUMP: Dumping / to /dev/null
  DUMP: bad sblock magic number
  DUMP: The ENTIRE dump is aborted.
```

Replacing the block device with the raw device in the example above will allow the dump.bsd command to execute correctly:

```
# dump.bsd 0f /dev/null /dev/rdsk/c0d0s0
  DUMP: Date of this level 0 dump: Wed Oct 21 12:43:56 1992
  DUMP: Date of last level 0 dump: the epoch
  DUMP: Dumping /dev/rdsk/c0d0s0 to /dev/null
  DUMP: mapping (Pass I) [regular files]
  DUMP: mapping (Pass II) [directories]
  DUMP: dumping (Pass IV) [regular files]
```

AppleShare 3.0: How to Remove and Return to System 7

Revised: 12/7/92
Security: Everyone

AppleShare 3.0: How to Remove and Return to System 7

==========

Article Created: 4 December 1992

TOPIC ----------

How do I remove AppleShare 3.0 from my Macintosh and return it to System 7?

DISCUSSION ----------

1) Remove the Users & Groups data file from the Preferences folder and restart.
2) Insert the AppleShare File Server disk in the drive and double-click the Installer.
3) Choose Customize.
4) Select items to remove. You can remove these individually or all at once depending on which you select:

   • AppleShare File Server (v3.0)
   • AppleShare Print Server (v3.0)
   • Apple II Setup (v2.1.3)
   • AppleShare Workstation (v3.0)

5) Hold down the Option key, and when the Install button becomes the REMOVE button, click on it.
6) Restart the computer.
7) The system creates a new Users & Groups data file. If you want to return to the data file you used before installing AppleShare 3.0, copy the original System 7 data file to the Preferences folder from a backup (the AppleShare 3.0 Users & Groups data file won't work).

Here's a list of the files automatically removed:

• AppleShare File Server
• AppleShare Print Server
• File Server Extension

- IWEm

There are three other files that aren't removed that you can remove manually:

- AppleShare Log (loose in System Folder)
- File Server Folder (in Preferences folder)
- AppleShare Print Server Folder (in Preferences folder)

QuickTime: Incompatibility with Third-Party Video Capture Boards

==========

Article Created: 4 December 1992

TOPIC --

When trying to capture video with Movie Recorder and a third-party video capture board, I sometimes get a system bomb, or sound but no video.

DISCUSSION --

According to SuperMac Tech Support and TrueVision Tech Support there's a beta copy of a "VDIG" INIT that solves these problems. You can get the necessary "VDIG" INIT from video capture board vendors when the INIT is final.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

At Ease 1.0: Can't Save Within Folders On Floppy Disk (6/95)

Revised: 6/13/95
Security: Everyone

At Ease 1.0: Can't Save Within Folders On Floppy Disk (6/95)

==========

Article Created: 4 December 1992
Article Reviewed/Updated: 13 June 1995

TOPIC ----------

I set up At Ease 1.0 to save to a floppy disk. When I try to save a document to a folder on the floppy disk, I get the dialog "Sorry, your work was NOT saved. You can only save onto a floppy disk. Please save again."

DISCUSSION ----------

If you have difficulty saving within a folder on a floppy disk, make sure neither of these choices are selected from the At Ease control panel:

- Add a button to At Ease
- Require a floppy disk

Unfortunately, this allows users to save to the hard disk as well as to the floppy disk.

When you select "Add a Button to At Ease" and "Require a Floppy Disk" from the At Ease control panel, some applications allow saving into a folder on a floppy disk and some won't. However, all applications will allow saving to the root level of the floppy disk.

As of the most recent article revised date below, here are some applications that allow saving to a folder:

- Microsoft Word 5.0
- Teach Text 7.1
- More 3.1
- Script Editor

As of the most recent article revised date below, here are some applications that won't allow saving to a folder:

- Microsoft Works 3.0
- Microsoft Excel 4.0
- MacWrite II 1.1v3
- Resolve 1.1v1
- Quicken 3.0
- FileMaker Pro
- Org Plus 1.0
- PageMaker 4.2
- AppleLink

Article Change History:
13 June 1995 - Corrected spelling and added 1.0 to the version number
04 May 1993 - Added an application that doesn't allow saving within folders

Macintosh PC Exchange: Symptoms of INIT Conflicts

==========

Article Created: 4 December 1992

TOPIC ----------

What kind of symptoms are usually associated with INIT conflicts when using Mac PC Exchange?

DISCUSSION ----------

Here are some typical symptoms of INIT conflicts:

- System won't mount a correctly formatted DOS disk without being told that it's unreadable.
- Can't open the Macintosh PC Exchange control panel to make changes.
- System freezes when mounting a correctly formatted DOS disk.

Macintosh PC Exchange: PC Icon on a Hard Disk

==========

Article Created: 4 December 1992

TOPIC ----------

When I place the PC file onto the hard disk, I'm unable to assign a creator/type. The file always shows up as a PC icon and never takes on the icon of the application it's assigned to.

DISCUSSION ----------

The assignment of the suffix to a creator/type applies to files that are on MS-DOS floppy disks only. Macintosh PC Exchange's creator/type selector won't access files you mount via a network, removable hard disk, or optical disk.

Macintosh PC Exchange: Apple 5.25-Inch Disk Drive

==========

Article Created: 4 December 1992

TOPIC ----------

I have a Macintosh LC with an Apple 5.25-inch disk drive attached. When I put a ProDOS or MS-DOS disk in the drive, the computer doesn't mount it to the Desktop. Why ?

DISCUSSION ----------

A Macintosh LC uses an Apple 5.25-inch disk drive in Apple IIe mode only. Macintosh PC Exchange is only active in Macintosh mode, and therefore won't be active. A Macintosh LC in Apple IIe mode won't recognize MS-DOS disks, and a Macintosh LC in Macintosh mode won't recognize ProDOS disks. When in Apple IIe mode, it should recognize ProDOS disks.

Security: Everyone

Macintosh PC Exchange: Losing Diacritical Marks

==========

Article Created: 4 December 1992

TOPIC ----------

When I convert a foreign word processor or text file (German, Spanish, French), from a DOS application to the Macintosh application, the special accent characters change or disappear from the document. Why does this happen, and what can I do to resolve the problem?

DISCUSSION ----------

Because Macintosh PC Exchange isn't a language translator, it's up to the specific Macintosh application to support the extended ASCII character set of the PC application. Be sure to use an application that supports these diacritical marks, so you won't lose them during the DOS-to-Macintosh translation of the document.

At Ease: Incompatible SCSI Drivers (10/93)

==========

Article Created: 4 December 1992
Article Reviewed/Updated: 13 October 1993

TOPIC -----

I selected Add Buttons in At Ease, and saved new documents to the removable drive that I mounted in the Finder mode. Now that I start up the computer in the At Ease mode, the Macintosh asks for the removable drive. When I insert the drive, the Macintosh still asks for the drive. There's no way out of this loop except to start up in the Finder mode with the extensions off.

DISCUSSION -----

Removable drives (such as Syquest) with incompatible drivers may not mount correctly. Therefore, when At Ease looks for the removable disk, and the documents that are on it, it can't resolve the alias causing the infinite loop.

Formatting the removable disk with a fully compatible SCSI utility program alleviates the problem.

Article Change History:
13 October 1993 - Added Syquest as an example.

Macintosh PC Exchange: RESOURCE.FRK File Seen on PC

Revised: 12/11/92
Security: Everyone

Macintosh PC Exchange: RESOURCE.FRK File Seen on PC

==========

Article Created: 10 December 1992

TOPIC ----------

After using Macintosh PC Exchange, I see a RESOURCE.FRK file when I put it into the PC. The PC didn't generate this. What is it, and why is it there?

DISCUSSION ----------

Macintosh PC Exchange creates a directory on the PC disk. Macintosh PC Exchange then installs resources to hold the information the same way it makes the Desktop files for the Macintosh volumes. This is normal and should be left alone if the disk will be used by the Macintosh. If you erase this file, Macintosh PC Exchange will recreate it the next time you insert the disk into a Macintosh.

PowerBook: Recharging Batteries (5/95)

Revised: 6/27/96
Security: Everyone

PowerBook: Recharging Batteries (5/95)

==========

Article Created: 2 November 1992
Article Reviewed/Updated: 9 May 1995

TOPIC ----------

This article discusses proper methods for recharging PowerBook batteries.

DISCUSSION ----------

All PowerBook models do not use the same kind of battery; it's important to know which type of battery you're using in order to recharge it properly.

Apple uses three different types of batteries for PowerBook computers:

- Sealed Lead Acid (SLA)
- Nickel Cadmium (NiCad)
- Nickel Metal Hydride (NiMH)

Each type of battery requires a different recharging technique to ensure maximum battery life.

Sealed Lead Acid

Recharge sealed lead acid batteries whenever they become depleted and never fully discharge the battery. Lead acid batteries should always be kept fully charged.

If a lead acid battery becomes fully discharged, it may experience sulfation. Sulfation occurs when the lead electrodes inside the battery convert to lead sulfate. This destroys the battery making it unable to hold a charge.

Nickel Cadmium

Recharge nickel cadmium batteries when they become depleted. Apple recommends fully discharging and recharging the battery approximately every 90 days.

Nickel cadmium batteries are subject to an issue known as "memory effect." If a NiCad battery is only partially discharged then recharged many times, it will begin to "remember" the level it was discharged to and won't fully recharge.

Here's an example: Let's assume your PowerBook battery has a normal capacity of 2.5 hours and you use your PowerBook for 1 hour a day, then recharge the battery overnight. After a period of time, approximately between 30-90 days, you'll discover that your battery now has a capacity of a little over an hour, instead of 2.5 hours.

The only way to recover the battery's full capacity is to fully discharge it, then fully recharge it.

Nickel Metal Hydride

Recharge nickel metal hydride batteries when they become depleted. Fully discharge and recharge the battery approximately every 30 days.

Nickel metal hydride batteries are also subject to "memory" and should be treated like nickel cadmium batteries.

How to fully discharge NiCad and NiMH Batteries

The best way to fully discharge NiCad or NiMH PowerBook batteries is to use your PowerBook normally, but to ignore the low-power messages that appear on the screen. Be sure, however, to save your work frequently. When the computer goes to sleep automatically, recharge the battery completely before using that battery again.

Length of time to recharge

Allow plenty of time to recharge a battery. It may take six to eight hours to completely charge a battery on some PowerBook models, longer if you're using the computer.

When you use the power adapter to run the computer and recharge the battery simultaneously, the battery may not be completely recharged during your work session. It's a good idea to leave the adapter plugged in overnight occasionally to assure that the battery is fully charged.

Here are some ways to recharge a fully depleted battery, from fastest to slowest:

- In an external recharger (one battery)
- In the computer while shut down
- In the computer in sleep mode
- In the computer while working

PowerBook: MIDI Problems and Workarounds (6/95)

Revised: 6/13/95
Security: Everyone

PowerBook: MIDI Problems and Workarounds (6/95)

==========

Article Created: 29 October 1992
Article Reviewed/Updated: 13 June 1995

TOPIC ----------

Some PowerBook owners have had problems using MIDI because PowerBook computers have difficulty reading long data streams through their printer and modem ports. This can cause dropouts in MIDI music sequences during playback.

This problem is mostly evident when recording System Exclusive dumps, in which libraries of information, such as sound patches, are recorded to a PowerBook. Playing system exclusive information (or other data) from a PowerBook, however, is not an issue.

This article provides:

- Overview of the problem
- Workarounds
- References and tips
- Utilities that improve compatibility

DISCUSSION ----------

Overview of the Problem

The serial communication problems on PowerBook computers affected two groups of users:

- Telecommunication users who communicated primarily in the 2400-19,200 bps (bits per second) range. Their problems were addressed by the changes incorporated into System 7.1.

- MIDI users who communicate at 38,400 bps. MIDI communication problems persist due to the much higher bps speed, and the fact that, in most cases, no error detection or correction protocol is used.

Because of design changes, the PowerBook 200 series computers do not have these MIDI problems. MIDI problems experienced by Macintosh IIvx users were addressed in version 1.0.1 of System Enabler 001. This Enabler is not required under System 7.5, since it is part of the system software.

The problems had to do with the transfer of large amounts of MIDI data TO a PowerBook. It has been resolved in the PowerBook 200 and 500 series, but is still present in PowerBook 160 and PowerBook 180.

In the PowerBook 200 and 500 series, the Power Manager disables interrupts for much shorter periods than in the PowerBook 100 series, removing the possibility of missing any interrupts from the Serial Communications Controller (SCC) chip.

Normal Recording and Playback Are Possible

With the majority of PowerBook computers and MIDI sequencers (a software-based version of the analog multi-track tape recorder), "standard" operations are possible. Such operations include recording, playback, instrument change, volume, pitch bend, and panning.

Data such as polyphonic aftertouch and pitch bend, the usual culprits (they require large amounts of data to express) do not cause a problem. The problem does not occur when sending single patches to a PowerBook 100 series computer.

The problem occurs when one is performing system exclusive functions such as dumping banks of data or samples (samples are much larger, usually, than any bank of patches) to a PowerBook 100 series computer.

A Workaround for System Exclusive Data

While large data dumps are at this time not possible with PowerBook 100 series computers, there is an alternative method. Instead of sending an entire bank of data, sending the information in smaller groups (one patch at a time) is possible. While this is inconvenient in comparison to sending the entire bank of info at once, it does allow system exclusive data to be transferred successfully.

It is common to have a desktop Macintosh in the home or at the office, and to use a PowerBook for live performance or for out-of-home recording work (such as at a professional studio). Patch and sample editing (which sometimes require data dumps from a MIDI device to the PowerBook) is rarely done on stage or during recording sessions. Sound editing on stage is usually impractical. As for studio work, it is much more economical to take care of pre-production tasks, such as sound editing, at home, or at a professional pre-production facility, which is almost always billed at a lower rate than recording time.

So, away from the studio, you can still easily transfer your banks, samples and sequences to your PowerBook 100 series computer via floppy, SCSI disk mode, or Personal AppleShare.

Then, once in the remote location (recording session, on stage, etc.) with your

PowerBook 100 series computer, you will be able to send patches, banks, samples, and sequences to any MIDI devices with no problems.

Clearly, this is only an interim solution, but it does show that many PowerBook 100 series computer MIDI users can still get a great deal of functionality from their setups in the meantime.

References and Other Tips

The June 1992 issue of "Keyboard" magazine has a well-written article by Geoffrey Ryle on using the PowerBook 100 series computers and MIDI. The missing files problem he mentions was solved by using System 7 Tuner version 1.1.1 with his Macintosh. The functionality of System 7 Tuner version 1.1.1 was included in System 7.1, so Tuner is not necessary with System 7.1 or greater. In addition, the PowerBook 200 and 500 series computers do not have these problems.

Remember to always use System 7 Tuner version 1.1.1 with Systems 7.0 and 7.0.1 to ensure optimum performance and to avoid any missing files problems. Before adding Tuner 1.1.1, it is advisable to back up your hard disk-based data, initialize the disk using Apple HD SC Setup (use Maximum Macintosh in most cases), install or restore your System Software, drop Tuner into your System Folder, and then restore your data. This is also a risk-free way to optimize your hard disk.

Utilities That Improve Compatibility

Two software utilities greatly enhance compatibility between PowerBook 100 series computers and MIDI programs. Until MIDI software developers provide upgrades that address the idiosyncrasies of PowerBook ports, these two programs are very useful to PowerBook 100 series computers/MIDI users:

- Apple's MIDI Management Tools version 2.0.2

  Software that consists of a small system extension and an application. This software will be posted to Apple software updates and ftp sites in the near future.

- Opcode's MIDI Mangler

  A shareware control panel. A program component of MIDI Management Tools, called Patchbay, lets users graphically connect the MIDI sequencer program to the correct PowerBook 100 series hardware port. The program is self-explanatory and easy to use. MIDI Mangler frees the printer and modem ports, allowing MIDI signals to pass freely through them.

Macintosh Portable: Purpose of Dip Switches

Revised: 11/3/92
Security: Everyone

Macintosh Portable: Purpose of Dip Switches

==========

Article Created: 3 November 1992

TOPIC ----------

What are the dip switches on the Macintosh Portable logic board used for?

DISCUSSION ----------

The dip switches at S1 on the Macintosh Portable (non-backlit model) were primarily used for internal testing purposes while debugging ROMs and the power manager during the development process. They remain on the board in case the ROM slot might be needed for a ROM card in the future. The other configurations should be ignored.

The jumper on the backlit Macintosh Portable at location W200 is also used for configuring the ROM slot.

It would be recommended to use the dip switch configuration as listed below.

The non-backlit Macintosh Portable has a 4 pin dip switch that controls the ROM configuration.
When the dip switch is: UP, DOWN, UP, UP = No ROM Card
UP, DOWN, DOWN, UP = ROM CARD

The backlit Macintosh Portable has a jumper to control the ROM configuration. When the jumper is in place (shipped configuration) = No ROM Card. When the jumper is removed = ROM Card.

Macintosh Quadras: Applications Incompatible with Internal Cache

==========

Article Created: 4 December 1992

TOPIC ----------

Every time I try to start up one or more of my applications, my Quadra crashes. The applications work fine on my other Macintosh computers. The problem even happens when I restart with extensions off. What can I do to stop this?

DISCUSSION ----------

One or more of your applications may be incompatible with the Quadra's 68040 internal cache. Try using the Cache Switch (found on the System 7.0.1 or 7.1 Tidbits disk) in the control panels, and switch it to "more compatible". Restart and try your application again.

If it works, you may want to see if a Quadra-compatible upgrade of your applications is available from the developer. Also be advised that with the Cache Switch in the "more compatible” mode, you sacrifice some of the Quadra's performance for the sake of the compatibility.

System 7: Bus and Address Errors After Clean Install

==========

Article Created: 7 December 1992

TOPIC ----------

I still get Bus errors or Finder Address errors even after a clean install. I have no third-party cards in the computer, and virtual memory and 32-bit addressing are off. What could be causing this?

DISCUSSION ----------

The problems could be caused by an improper SCSI configuration. You can test this by shutting down and disconnecting all external SCSI devices. Then repeat the clean install on your internal drive with no external SCSI devices connected. If the problems stop, then troubleshoot your SCSI chain.

Hint: check for long SCSI cables (5 feet or more), and replace them with shorter cables.

System 7: Compatibility with Farallon Ethernet Drivers

Revised: 12/8/92
Security: Everyone

System 7: Compatibility with Farallon Ethernet Drivers

==========

Article Created: 7 December 1992

TOPIC ----------

I need a list of System 7 compatible Farallon drivers.

DISCUSSION ----------

Here's a list of Farallon compatible driver versions:

Product	Current Version	Minimum Required for System 7
Phonenet Ethernet (Nubus)	4.1	4.0.1
Phonenet Ethernet (SI,SE30)	4.0.1	4.0.1
EtherMac Cards	1.0	1.0

Incompatible Driver Problems

If the Ethernet driver software isn't updated to the minimum needed for System 7, you may experience a variety of problems, including:

- Intermittent network disconnects
- Data transfer slow-downs
- The inability to turn Ethernet on in the Network control panel

To locate a vendor's address and phone numbers, use the vendor name as a search string.

System 7: 64K Buffer RAM on Farallon Card for AppleShare Server

Revised: 12/8/92
Security: Everyone

System 7: 64K Buffer RAM on Farallon Card for AppleShare Server

==========

Article Created: 7 December 1992

TOPIC --

My AppleShare server is responding very slowly since installing the Farallon Ethernet card. It's a System 7 compatible card and has System 7 compatible driver software. I sometimes experience temporary network disconnects.

DISCUSSION --

Farallon Ethernet-equipped Macintosh computers that get heavy network traffic like AppleShare file servers require additional buffer RAM on the Farallon Ethernet card. Most Farallon Ethernet cards ship with 16K of buffer RAM. But 64K is recommended if the network traffic is high. You can obtain the additional RAM from Farallon.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Article Created: 7 December 1992

TOPIC ----------

Does Novell provide print spooling to Macintosh computers on the Novell networks, and are they compatible with System 7?

DISCUSSION ----------

Novell Netware 286 Server, Netware for the Mac, version 2.2, provides print spooling for Macintosh computers printing to PostScript printers and it's System 7 compatible.

Novell Netware 386 Server, Netware for the Mac, version 3.0.1 or 3.0.1.1 provide print spooling for:

- Macintosh computers printing to PostScript printers, and
- Macintosh computers or PCs printing to networked printers or printers serially connected to the Novell server.

Both are System 7 compatible.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

System 7: Compact Virtual 3.0 and TransWarp Accelerator Board

Revised: 12/8/92
Security: Everyone

System 7: Compact Virtual 3.0 and TransWarp Accelerator Board

==========

Article Created: 7 December 1992

TOPIC ----------

I have Compact Virtual 3.0 from Connectix and a TransWarp accelerator board from Applied Engineering in my Macintosh SE. I have difficulty formatting floppy disks.

DISCUSSION ----------

Both Connectix and Applied Engineering say there's a problem with this configuration when using System 7. They tell us that System 7.1 should correct it.

If you're using System 7, turn off Compact Virtual when formatting floppy disks.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Performa and Performa Plus Display: Specifications (11/94)

Revised: 11/8/94
Security: Everyone

Performa and Performa Plus Display: Specifications (11/94)

==========

Article Created: 3 November 1992
Article Reviewed/Updated: 8 November 1994

TOPIC

This article contains the specifications for:

- Macintosh Performa Display
- Macintosh Performa Plus Display

The dot pitch is the key difference between the two displays.

DISCUSSION

Picture Tube

- Diagonal measurement: 14-in.
- CRT Type: P22 phosphor, single in-line gun, shadow-mask CRT

Input Signals

- Video: Analog, modified RS-343
- Sync: Composite horizontal and vertical sync

User Controls

- Front
  - Power on/off SK1 (including LED indicator)
  - Brightness
  - Contrast
  - Horizontal phase (centering)
  - Vertical centering

- Rear
  - Horizontal width
  - Vertical height

Scanning Frequencies

- Horizontal: 35 KHz
- Vertical: 66.7 Hz
- Dot clock: 31.91 ns

Video Specifications

- Resolution: 640 dots Horizontal x 480 lines Vertical
- Dot Pitch: Performa Display - .39mm
  Performa Plus Display - .29mm and .28mm
- Dots Per Inch: 67 DPI
- Bandwidth: 18 MHz
- Active Display Area: 240mm Horizontal x 180mm Vertical
- White Point: 9300 deg. K

The CIE coordinates

Red	x = .620(+-.020)	y = .340(+-.020)
Green	x = .305(+-.020)	y = .600(+-.020)
Blue	x = .155(+-.020)	y = .065(+-.020)

Shipping brightness is 32 (+-5) Foot-Lamberts

Physical Specs

- Weight: 35 lbs. (15.9 kg)
- Height: 12.75 inches (32.4 cm)
- Width: 13.9 inches (35.2 cm)
- Depth: 14.75 inches (37.5 cm)

Power Requirements

- Watts: 85 watts maximum
- Input Voltage: 98-132 VAC
- Frequency: 57-63 Hz

Environmental Requirements

- Operating ambient temperature: 50 to 104 deg. F (10 to 40 deg. C)
- Operating humidity: 90% maximum, non-condensing
- Operating altitude: 10,000 ft maximum

Input Signal Jack Pin Assignments

- Type of connector: DA-15 style connector

Pin	Function

MacX 1.2 and A/UX 3.0: Compatibility and Upgrades

Revised: 11/11/92
Security: Everyone

MacX 1.2 and A/UX 3.0: Compatibility and Upgrades

==========

Article Created: 2 November 1992

TOPIC -----

This article answers several questions about MacX 1.2 and A/UX 3.0.

DISCUSSION -----

Q: Is MacX 1.2 compatible with A/UX 3.0?
A: Yes, MacX 1.2 is compatible with A/UX 3.0.

Q: If a customer has A/UX 3.0, is there a special (discounted) upgrade path to move from MacX 1.1.7 to MacX 1.2?
A: Please refer to the Apple Suggested Retail Price List for the MacX Update product for MacX 1.0, 1.1, or 1.1.7. The part number is M1197LL/B. This is your upgrade path.

Q: Does it make a difference if the customer has purchased A/UX 3.0 within the last month and also purchased the Right-to-Update A/UX 3.0?
A: No, to update to MacX 1.2 you need the MacX Update product which is available to you for a minimal charge.

Macintosh Quadra 700, 900: Built-In Video (3/93)

Revised: 3/25/93
Security: Everyone

Macintosh Quadra 700, 900: Built-In Video (3/93)

==========

Article Created: 9 October 1992

Article Change History

03/23/93 - REVISED
- To break into separate articles.
- To synchronize with similar article on Macintosh Centris series and Quadra 800.

- RETITLED
- To specify Quadra 700 and 900 models.

TOPIC ----------

This article, by the designer of the Macintosh Quadra's video hardware, discusses a number of general Quadra video topics.

DISCUSSION ----------

The Quadras were designed with a flexible video hardware section in order to support a wide variety of displays. Since the purchaser of one of these systems is paying for a frame buffer on the logic board (whether (s)he wants it or not), and since the Quadras were designed to be high-performance machines, the frame buffer was designed to be both very flexible (to support most displays a user may want to use) and to be relatively high performance (to match the computer's capabilities).

Obviously every display made by every third-party monitor vendor can't be supported by the onboard video, but the Quadras do support a much wider range of displays at a higher level of performance than any previous Macintosh. The Quadra 700 and 900 support pixel depths ranging from 1 to 32 bits per pixel (bpp), Apple displays ranging from the 512 x 384 12-inch color monitor through the 1152 x 870 21-inch color monitor, pixel clocks ranging from 12 to 100 MHz, and a variety of industry standards such as VGA, SVGA, NTSC, and PAL. The Quadra video port produces RS-343 RGB,

and also provides horizontal, vertical, and composite sync outputs.

Composite or S-video output is not provided, but can be accomplished by use of an external RGB-to-composite encoder. The Quadra 700 and 900 also support Apple convolution for flicker-reduction on interlaced displays (i.e., NTSC and PAL) at up to 8 bpp. The Quadras automatically detect the type of display attached to the video connector via three 'sense' pins on the video connector. Depending on the wiring of these three pins, software in ROM configures the video hardware for one of the supported display types. (A full description of sense pin wiring and supported display types is in another article.)

The Quadra series provides the highest built-in video performance of any Macintosh to date. In a (very) simplified graphics model, we could say that performance depends on two main factors: processor horsepower and the bandwidth the processor has into frame buffer memory. These systems already have a fast processor -- the 68040 -- which runs standard 32-bit QuickDraw. To provide high bandwidth into frame buffer memory, dedicated video RAM (VRAM) was used for the frame buffer, and that VRAM was placed directly on the 68040 processor's local bus. This provides the 68040 the same access time into frame buffer memory that it has into main system RAM. (Transfer rates can exceed 40MB/sec.) In addition, memory options such as fast page mode are supported, which can improve graphics performance for operations such as scrolling, offscreen-to-onscreen pixmap transfers, etc.

In a number of cases the design was optimized for high performance over low cost. A good example of this is 32 bpp operation on Apple's standard 13-inch RGB monitor at 640 x 480 resolution (and this also applies to VGA and NTSC), which is probably the most common color monitor in use on the Macintosh. The actual number of memory bytes needed to support 24 bpp is 640 x 480 x 3 = 921,600. This would seem to fit within 1MB of memory (as is the case with the Macintosh Display Card 8•24), but the Quadras actually require 2MB of VRAM for this mode. The 8•24 card supports 24 bpp at 640 x 480 by using a storage mode called 'chunky planar' to fully utilize all its 1MB of VRAM. However, this results in having to perform three separate memory accesses for each 24-bit pixel read from or written to the frame buffer. (This is done in hardware, so software only performs a single read or write.) On a NuBus video card, this inefficiency is partially masked by the synchronization delays which occur at the processor-bus/NuBus interface. However, when frame buffer memory is placed directly on the processor bus, this approach results in a nearly 3x performance degradation. This was judged unacceptable for the Quadras. Each 24-bit pixel occupies one longword (4-bytes) in VRAM, so the Quadras actually provide 32 bpp for the 640 x 480 resolution. This pushes the memory requirement for this mode over the 1MB boundary (640 x 480 x 4 = 1,228,800 bytes). Performance is improved still more by another frame buffer architectural feature. Frame buffer memory in the Quadras is organized into 4 'banks' of 512 KBytes per bank. As mentioned earlier, Quadra VRAM can operate in fast page mode. In addition, each bank of VRAM operates in fast page mode independently of the other 3 banks. This causes the number of in-page 'hits' to increase, and thus improves the effective bandwidth into the frame buffer. Also, at 32 bpp, 640 x 480 resolution, each row is set to 4096 bytes, or 1024 32-bit pixels. Each

successive row is assigned to a different VRAM bank (modulo 4, of course).

This memory organization improves performance during certain commonly performed graphics operations such as vertical scrolling.

In any design there are a number of tradeoffs to be made, and this is certainly true for the frame buffer in the Quadras. While the video does operate at 32 bpp on up to 16-inch displays, it does not support 21-inch displays at this pixel depth since this would have significantly raised the cost of the motherboard. (Memory capacity and bus bandwidths would essentially have to double, and this would be expensive.) It does support NTSC and PAL timing, but does not provide a composite video output. While it is much faster than any non-accelerated video card, there are accelerated video cards that are faster (and much more expensive). A separate graphics processor was not added primarily for cost reasons. However, a graphics processor such as the 29000 RISC chip on the Display Card 8•24 GC can only speed up the graphics operations that it was designed to know about. If an application program bypasses QuickDraw (which is what most Macintosh graphics accelerators are designed to speed up), a graphics accelerator will not improve performance, and can actually cause a performance degradation.

Overall, the Macintosh Quadra video provides a reasonable compromise of cost, performance, and features, which provides the video needed by the majority of Macintosh users at a reasonable price.

Performa 600: Difference Between Accelerator and NuBus Slots

Revised: 11/11/92
Security: Everyone

Performa 600: Difference Between Accelerator and NuBus Slots

==========

Article Created: 4 November 1992

TOPIC ----------

What is the difference between the Accelerator and NuBus Slots in the Performa 600?

DISCUSSION ----------

NuBus Slots

The NuBus slots of the Performa 600 are designed to accommodate networking, video, and other expansion cards. Expansion cards in NuBus slots are restricted to run at the clock speed of the NuBus, which is 10 MHz.

Accelerator Slot

The Accelerator slot of the Performa 600 is a 120-pin slot that is designed to accommodate a CPU accelerator card. The slot is directly connected to the microprocessor and doesn't have any restrictions on its clock speed. An accelerator card, which functionally replaces the microprocessor, must be able to run at high speed and cannot run in a NuBus slot, which is restricted to 10 MHz.

Note that the Performa 600's Accelerator slot signals are a subset of the Macintosh IIci cache connector slot. Processor address, data and some control signals are provided, but cache control signals are NOT provided. Cache cards, such as the Macintosh IIci cache card, will not work in the Performa 600's Accelerator slot.

StyleWriter: How to Clean Ink Stains From the Platen

Revised: 11/11/92
Security: Everyone

StyleWriter: How to Clean Ink Stains From the Platen

==========

Article Created: 4 November 1992

TOPIC ----------

How should I clean ink stains from a StyleWriter's platen?

DISCUSSION ----------

If your StyleWriter's platen becomes stained with ink, you should first run a few sheets of clean paper through the printer. If this doesn't remove all of the ink, dampen a soft cloth -- with water only -- and wipe the platen clean.

Do not use any chemicals or abrasives on the platen, as they will deteriorate the platen surface.

MacX: bdf Extension Is the Key to Compiling bdf Fonts (11/92)

Revised: 2/16/93
Security: Everyone

MacX: bdf Extension Is the Key to Compiling bdf Fonts (11/92)

==========

Article Created: 30 November 1992

TOPIC ----------

When I try to compile bdf fonts in MacX, MacX returns the message "Unable to open font compiler output ..."

Disk space and access privileges are not a problem.

DISCUSSION ----------

When MacX compiles a bdf font, it gives the output file the same name as the input file, after stripping the .bdf extension. If the file does not have the .bdf extension to start with, MacX tries to overwrite the opened input file. Because this file is already open, MacX fails with the error you described above. The solution is to add the suffix .bdf to all the source files used to compile bdf files under MacX.

Apple 13 and 14 Color Displays Compared to VGA Monitors

Revised: 11/11/92
Security: Everyone

Apple 13" and 14" Color Displays Compared to VGA Monitors

==========

Article Created: 5 November 1992

TOPIC ----------

This article describes the main differences between VGA monitors and Apple's 13-inch and 14-inch color displays: the AppleColor Hi-Resolution RGB Monitor and the Macintosh Color Display.

DISCUSSION ----------

There are several variations of VGA monitors, but they all operate on newer MS-DOS computers that support the VGA standard.

The Apple displays you mention have a standard screen resolution of 640 by 480 pixels. There are, however, significant differences between the operational specifications of the Apple Monitors and VGA Monitors.

Refresh rate

VGA monitors	60 hz (actually 59.94 hz)
Apple displays	66.7 hz

Refresh rate is the number of times per second (or cycles) that a complete new screen is written. The Apple displays have a faster refresh rate than VGA monitors. This helps to produce an essentially flicker-free screen. In addition to looking better, it reduces eye strain that accompanies the 60hz rate of the typical VGA monitor.

Bandwidth

VGA monitors	18 to 24 Mhz
Apple displays	30.24 Mhz

Monitor bandwidth is the major factor that determines the amount of video

"detail" that is displayed on the screen. It is a direct function of the monitor hardware, and cannot be changed. Given the bandwidth specifications listed above, the Apple Monitors provide a superior video image when displaying highly detailed graphics.

CRT Flatness

The surface of the CRT screen of the Apple Monitors is considerably flatter than that of VGA monitors.

Flatter screens are easier to read, which makes using the Apple displays more pleasant than the comparable VGA monitor.

Dot pitch

VGA monitors	from 0.29 to 0.39 mm
Apple displays	0.26 mm

Dot pitch is the distance between CRT pixels. As the dot pitch gets smaller, the display becomes sharper. Dot pitch in the 0.29 to 0.39 mm range produce an increasingly grainy look as the dot pitch value approaches 0.39 mm. The Apple displays' smaller dot pitch provides a sharper and cleaner appearance than a VGA monitor.

PowerBook RAM Upgrades: Don't Remove Rubber Heat Sinks 11/92

Revised: 5/16/94
Security: Everyone

PowerBook RAM Upgrades: Don't Remove Rubber Heat Sinks 11/92

==========

Article Created: November 9, 1992

TOPIC ----------

I have a third-party 4MB RAM upgrade I want to install in a PowerBook, but it doesn't fit because four chips on the daughterboard have a large 1/4- inch piece of rubber on top of them. What is the rubber for, and is it safe to remove it?

DISCUSSION ----------

The pieces of rubber on the chips are heat sinks. It is essential that you leave them in place, because if you remove them:

• Too much heat will be generated internally.

• Warranty coverage is voided.

Apple has given strict design guidelines to third-party developers, and we suggest that customers get verification that products meet Apple specifications.

System 7 Fonts Fldr: Advantage to Store Fonts Suitcase? (2/95)

Revised: 2/15/95
Security: Everyone

System 7 Fonts Fldr: Advantage to Store Fonts Suitcase? (2/95)

==========

Article Created: 11 November 1992
Article Reviewed/Updated: 15 February 1995

TOPIC ----------

When using System 7.1 or 7.5, is there any advantage either in memory utilization or performance in storing fonts in one suitcase file in the Fonts folder, or storing them individually as font files?

DISCUSSION ----------

There is one advantage to storing the fonts all in one (or many) suitcase files in the Fonts folder. The Fonts folder is limited to 128 font or suitcase files, if you have many individual fonts, you can reach this limit fairly quickly. Combining multiple fonts into a font suitcase helps manage to this limit.

The only performance benefit with fonts in System 7.1 is during installation of the font. Under 7.1 and higher you simply drag fonts into a folder rather than opening up the system file.

Macintosh IIvx: Clock Speeds

Revised: 11/11/92
Security: Everyone

Macintosh IIvx: Clock Speeds

==========

Article Created: 11 November 1992

TOPIC -----

I've heard that the processor in the IIvx is not a "true" 32 MHz, and that the processor is similar to the Intel DX2 clock doubling technology. Is this true?

DISCUSSION -----

As you are aware, Apple has produced various architectural solutions to computing problems over the years. Some, like the IIfx and Quadras, do so by running the microprocessor and other associated components at a higher clock speed than the rest of the main logic board. For example, the IIfx has a 40 MHz 68030 and a 20 MHz I/O bus. The Quadra 700 and 900 have a 25 MHz 68040 and a 16 MHz I/O bus. And the Quadra 950 has a 33 MHz 68040 and a 25 MHz I/O bus.

On the IIvx, the cache, FPU, and the 68030 run at 32 MHz. Whereas, the RAM, ROM, VRAM and the I/O subsystem run at 16 MHz. The IIci and IIsi have the same main logic board and microprocessor clock speeds.

PowerBook/DOS Companion: Description

Revised: 3/14/94
Security: Everyone

PowerBook/DOS Companion: Description

==========

Article Created: 16 November 1992
Article Reviewed/Updated:9 February 1993

TOPIC ----------

This article describes the PowerBook/DOS Companion software product.

DISCUSSION ----------

With Apple's PowerBook/DOS Companion, you can:

- Connect a Macintosh PowerBook computer to any PC-compatible (Intel- or MS-DOS-compatible) computer, either desktop or laptop, either with the kit's cable or via modems.

- Transfer files between the two computers in either direction, and convert files between the most popular word processing, graphics, spreadsheet, and database formats.

- Use MS-DOS or Windows 3.5-inch diskettes as if they were Macintosh diskettes.

- Connect to most VGA monitors with a PowerBook 160 or 180, or with a PowerBook Duo 210 or 230 connected to a Macintosh Duo MiniDock.

- Print documents directly from your PowerBook with your printer -- whether it's a laser, ink-jet, or dot-matrix -- using PowerPrint.

What's Included

MacLinkPlus/PC from DataViz
- Handles file translations and transfers from DOS and Windows to Macintosh
- Works with more than 700 of the most popular word processing, graphics, spreadsheet, and database programs
- Includes direct connect cable

Macintosh PC Exchange software from Apple
• Recognizes MS-DOS, Windows, and OS/2 disks

MacVGA Video Adapter from James Engineering
• Supports most VGA and SVGA monitors to display work in 256 colors
• Works with PowerBook 160 and 180, and with PowerBook Duo 210 and 230 connected to a Macintosh Duo MiniDock

PowerPrint from GDT Softworks
• Supports print drivers for more than 1000 printers
• Includes serial-to-parallel cable

Support

All of these products work with desktop Macintosh computers, as well as with PowerBooks. Apple supports Macintosh PC Exchange; support for the other software products in the kit is provided by their respective vendors.

Ordering Information

• PowerBook/DOS Companion
• Order No. M9400LL/A

Article Change History

SNMP Technical Introduction, Part 1 of 3

Revised: 11/24/92
Security: Everyone

SNMP Technical Introduction, Part 1 of 3

==========

Article Created: 10 November 1992

TOPIC ----------

This is the first of three articles that introduce SNMP (Simple Network Management Protocol). This article describes the evolution of management and troubleshooting tools used by network administrators, and describes network management for the Macintosh.

DISCUSSION ----------

Introduction

Since the early days of data communications, network administrators have been searching for ways to increase the availability, usefulness, and performance of their networks.

The networking environment has also changed. Data communications has become much more complex since the days of point-to-point low-speed serial connections. Today's networks consist of not only traditional point-to-point connections, but include LANs (Local-Area Networks) serving distributed databases, network servers, and other services. The ability to centrally administer services, configure network devices, detect and diagnose problems, and plan for future growth has become critical to the successful operation of any large network.

Packet Analyzers

One of the first tools developed was the packet analyzer. Early packet analyzers consisted of dedicated hardware and software, such as the Hewlett-Packard Datascope, or (more recently) Network General's Sniffer.

These devices capture and analyze network packets. They must be physically connected to the cable segment being monitored in order to see all the traffic. Packet Analyzers operate at the Physical and Data Link layers of

the OSI model. To decode and analyze the captured packets, the packet analyzer must understand the various protocols on the cable. Furthermore, to monitor connection-oriented protocols, the packet analyzer must maintain the state of the connection so it can understand the actions of the entities involved.

Interpreting and analyzing network packets usually requires technical knowledge of the protocols, so packet analyzers are used mainly by experienced network administrators.

Recently, various vendors have developed lower cost, lower performance packet analyzers which run on desktop computers. For example, the AG Group's EtherPeek and LocalPeek, and Neon Software's NetMinder Ethernet and NetMinder LocalTalk products run on the Macintosh.

Network Monitors

The second type of passive network management tool is the Network Monitor. A monitor observes network traffic to keep track of various services and other important network information. These products typically issue a warning if a service suddenly disappears, or if there is something odd about the traffic originating from a particular node. Network monitors rely on the traffic output by various services on the network, so are very useful in environments where services advertise themselves, such as AppleTalk.

Monitoring at the Transport and Network layers of the OSI model provide further advantage.

A number of Network Monitor tools have emerged for AppleTalk environments, including NetWatchman and TrafficWatch II. While network monitors are more useful in managing networks than packet analyzers, they still do not allow control of the network.

Pro-Active Network Management

The third class of tools involve pro-active network management. These tools can manage network routers, bridges, gateways, nodes, servers and other devices on the network. In multi-vendor networking environments, this is still a developing field. Perhaps the biggest risk of pro-active management is the security scheme implemented to prevent unauthorized manipulation of the network and its resources. And of course, everyone on the network must agree on the management protocol in order for this to be successful on a multi-vendor network.

Historically, the software to manage a particular networking device has been provided by the vendor of that device. Because no standards existed until recently, a specific vendor's console usually could not manage other vendors' devices, unless it was specifically designed to do so. As networks grew, customers often found themselves connecting networks with products from different vendors, and trying to manage their networks using different, and incompatible, management software. Consequently, managing large networks was, and still is, fairly difficult.

Pro-active network management requires access to all seven layers of the OSI model, as services such as file servers and print spoolers require management at the application layer.

SNMP is a good example of a tool with good pro-active management potential. SNMP has a number of advantages over proprietary management schemes, and these will be discussed in detail later.

Network Management and AppleTalk

AppleTalk networks are really no different from others in regards to troubleshooting, monitoring, and active management.

Many of Apple's customers, especially large customers, have been asking for tools to manage Macintosh computers and AppleTalk networks for a number of years.

Tools such as Apple's Inter•pol, and products like Status•Mac from Pharos Technologies and GraceLAN from Technology Works, Inc. have attempted to address this need through proprietary protocol implementations using AppleTalk as transport.

Recently, this demand has risen dramatically, as customers increasingly interconnected their networks and as network management solutions standards, like Simple Network Management Protocol (SNMP), started emerging. MacIS (a Macintosh users group consisting of Management Information Systems professionals) has put network management from Apple near the top of their wish list for two years (1990-91). In 1991, they further specified that this solution should be SNMP-based.

Recently, Apple had embarked on a strategy to implement yet another proprietary network management scheme utilizing new AppleTalk protocols, AppleTalk Management Protocol. In the process of creating this product, feedback from our customers, field support and sales staff, as well as internal project participants leads to a decision to change the direction of our network management strategy.

Instead of inventing a new protocol, the team decided to adopt an open industry-standard implementation leveraging off existing management and transport equipment and software -- a direction strongly supported by our customers, field support, sales staff, and organizations such as MacIS.

Besides addressing a major customer need with SNMP based network management products, Apple has an opportunity to have a major impact on the Internet-standard Network Management framework definitions, particularly those that address the AppleTalk environment. Further, this enhances the ability of Apple and third parties to develop unique and state of the art tools to aid in the design, setup, management and growth of new existing AppleTalk based devices in a multi-vendor, multi-protocol, environment.

SNMP Technical Introduction, Part 2 of 3

==========

Article Created: 10 November 1992

TOPIC ----------

This is the second of three articles that introduce SNMP (Simple Network Management Protocol). This article describes SNMP's history, management model, and architecture.

DISCUSSION ----------

SNMP History

Simple Network Management Protocol (SNMP) originated in the Internet community as a means for managing TCP/IP networks and Ethernet networks.

Every large network sooner or later displays a need for management and control, and the worldwide TCP/IP Internet is no exception.

In November 1987, a working group of the Internet Engineering Task Force (IETF) submitted a proposal to address some of these needs. They defined the Simple Gateway Management Protocol (SGMP), an early attempt at TCP/IP Internet management, and the forerunner of SNMP. SGMP is similar to SNMP in design and architecture, however syntax differences make the two incompatible.

In August 1988, the same four authors enhanced their proposal, and submitted a draft standard (Request For Comments 1098 entitled "A Simple Network Management Protocol"). RFCs are a method of defining and discussing enhancements to the Internet.

One of the main design criteria was simplicity. Another was to make the monitoring and control capabilities quite extensive. Due to the variety of devices on the Internet, the authors wanted to create an architecture independent of any specific host/gateway architecture.

In April 1989, RFC 1098 became an Internet Recommended Standard, and was rapidly implemented on the worldwide Internet.

SNMP's appeal broadened rapidly beyond the Internet community. SNMP attracted users looking for a proven and readily available way to manage their networks. SNMP's monitoring and control mechanisms operate completely independent of the TCP/IP protocol. SNMP requires only the datagram transport mechanism to operate. It can be implemented over any network media or protocol suite, including AppleTalk.

In May 1990, RFC 1098 was re-released, with typographical errors corrected, and a rewritten status section. RFC 1157 is the basis for Apple's network management strategy.

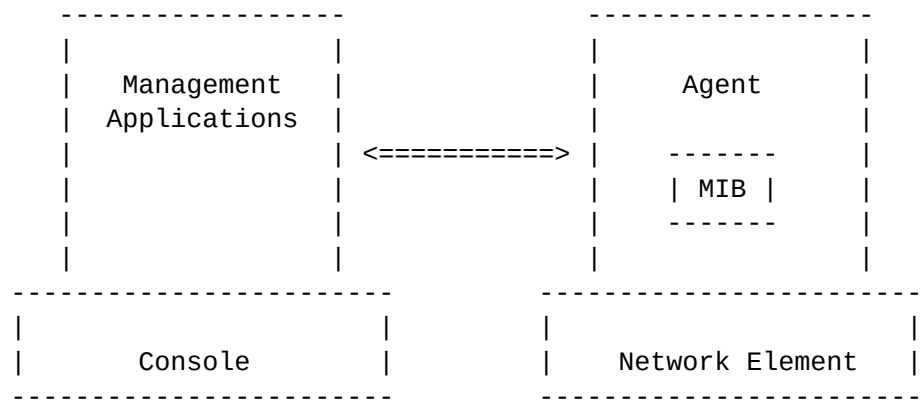
The Management Model

A network management system contains three main components:

- Several network elements, or nodes, which need to be managed.
- At least one management station used to administer the network.
- A management protocol that is used to communicate between the nodes and the manager.

SNMP Architecture

The SNMP architecture conforms to this management model. It defines these three major components: managed nodes (network elements), at least one network management station (console), and a protocol to communicate between the two. The diagram below displays this relationship in SNMP.



Network Elements (Nodes)

Network elements are devices such as hosts, gateways, terminal servers, and desktop computers. They are also known as managed nodes, nodes, or "entities." Network Elements can also be hubs or multiplexors. Although simple in concept, the network elements actually perform most of the work in SNMP, and contain all the information a management console needs to perform its function.

Consoles

Consoles are the management stations. They execute management applications to monitor and control network elements. They display, often graphically, the state of the current network and any alarms present.

The Protocol

SNMP is used to communicate management information between the network management stations and the agents in the network elements.

Inside the Network Element (Node)

Agents. Network Elements have agents responsible for performing the functions requested by the network management stations. Agents do the real work in SNMP management. Agents execute commands issued by the console, as well as reporting on unusual events.

Agents control and provide access to a Management Information Base (MIB), which contains the information to respond to console requests and updates.

Overview of the MIB

SNMP depends on the relationship between the console, agents, and the MIBs and agent controls.

The MIB contains groups, which are collections of objects.

Objects define data types, such as text strings, counters, gauges, time ticks, addresses, and integers. Each object has a unique name. (The naming convention used is discussed in the next section.)

The data fields that objects define are called variables. These are the fields where the actual data or value is stored. Each variable also has a unique name, using the same convention as the objects.

MIBs are encoded using OSI's Abstract Syntax Notation One (ASN.1). This language is used to define the objects in the MIB. ASN.1 is an international standard, implemented by most of the world's computer manufacturers. ASN.1 encoding makes the MIB platform independent.

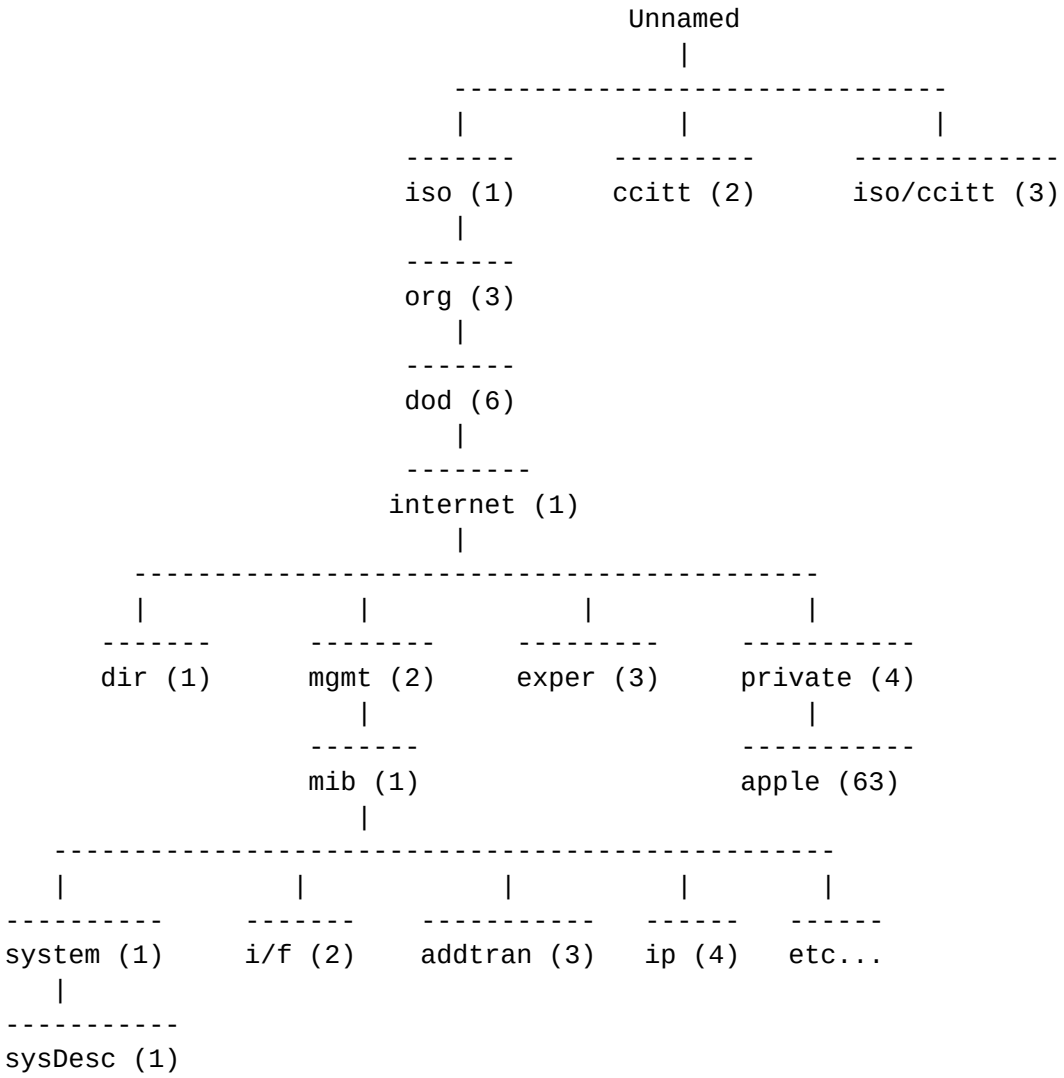
The Structure and Representation of MIB Objects and Variable Names

---

Names used for MIB objects and their variables are taken from the object identifier namespace, administered by ISO and CCITT. The key idea behind the object identifier is to provide an environment in which all possible objects can be uniquely named.

Authority for parts of the namespace is subdivided at each level, allowing individual groups to assign names without consulting a central authority for each assignment.

This tree structure is used to identify each and every MIB object, and in fact they are accessed programmatically using this structure.



In the figure above, each item has a number associated with it. These numbers correspond to specific paths to locate information in an SNMP network element, and give each object a unique name. For example, the unique name for the object that contains the system description (machine type) of the network element is described as:

iso.org.dod.internet.mgmt.mib.sys.sysDesc

The number representation of the above map is:

1.3.6.1.2.1.1.1

SNMP consoles actually use the number string to address the objects in the packets that travel the network, and in the programs used to construct the packets. Although this number string addresses the object, it is not enough to address the first variable containing the data or value, which is the number the console really wants.

There are no zeros on the map because a zero is used to reference the

actual data (value) of a variable.

To obtain a value from the object named sysDesc, add a zero to the number string. Therefore, a Get command would use 1.3.6.1.2.1.1.1.0 to obtain this value. An example of a response would be the text string "Macintosh IIx."

A significant benefit of this architecture is that it allows the development of consoles that can manage the products of many different vendors -- because all the objects are unique. Generic SNMP consoles, which often know little or nothing about specific manageable network devices, incorporate, or are able to import, MIBs because the coding and data representation rules are standardized, and the object names are preassigned and unique.

One of the main features of SNMP is allowing vendor-specific implementations of the MIB. Non-standard, vendor-specific MIBs would come under the Enterprise branch of the object identifier namespace. Organizations, such as Apple, can apply to the Internet Activities Board (IAB) for specific Enterprise numbers to keep their MIBs unique. Apple Computer's Enterprise number is 63, and over 100 other companies have applied for unique numbers, to provide an indication of how many vendor-specific MIBs will be implemented over time.

Consoles can compile imported MIBs and issue commands to agents. These consoles then display, often graphically, the information returned by the agents. Because these generic consoles are not product specific (MIBs are) they can even be used to manage network products that ship after the console itself is sold.

SNMP Technical Introduction, Part 3 of 3

==========

Article Created: 10 November 1992

TOPIC ----------

This is the third of three articles that introduce SNMP (Simple Network Management Protocol). This article describes SNMP Protocol and Operations, Management Concepts, and concludes with a comparison of OSI vs. SNMP.

DISCUSSION ----------

SNMP Protocol and Operations

The next step is to get the management console(s) in communication with the nodes on the network.

Messages
Communication among protocol entities is accomplished by the exchange of messages, each of which is entirely and independently represented in a datagram. SNMP messages require only an unreliable datagram service, and every message is entirely and independently represented by a single transport datagram.

With SNMP, TCP/IP networks use User Data Protocol (UDP) to exchange messages. With AppleTalk, the Datagram Delivery Protocol (DDP) is used.

A message consists of a version identifier, an SNMP community name, and a Protocol Data Unit (or PDU), which contains the command and its operands. As was the case with MIBs, messages and data all use the basic encoding rules of OSI's Abstract Syntax Notation One (ASN.1). This allows data exchanges to occur smoothly over a variety of platforms.

SNMP Command Set
The network management protocol allows the variables of an agent's Management Information Base (MIB) to be inspected or altered. The protocol is based on sending requests and getting responses. Most commands are

requests to either set the value of some parameter or to retrieve such a value.

To make SNMP simple, its designers defined a limited command set. A console can issue only three commands: Get, GetNext, and Set.

- The Get command allows a console to read a specified management variable in the managed device. An agent would execute a GetResponse command to return desired values to the console.

- The GetNext command allows the console to read the subsequent variables in the agent's database (MIB) without specifying the name of that particular variable. This command allows even consoles that do not have the appropriate MIB installed to manage SNMP based network devices. Perhaps the most powerful use of this command is to obtain an entire string of data with one call, as GetNext accepts multiple operands. SNMP advocates like to refer to this command as the "powerful GetNext command."

A console can also modify certain variables for which the console has the required access privileges using the Set command. This allows an administrator to reset a variable that keeps count of a certain occurrence, or to remotely set a flag that signals an agent to perform some specified function. An agent would execute a GetResponse command to return desired values to the console.

An agent can issue two commands: GetResponse and Trap.

- The GetResponse command is used by an agent to assemble and return values to the console.

- Finally, the Trap command allows a managed entity to send a message to a specific console, when a specified event occurs. The agent is responsible for detecting the event and issuing the Trap command.

Trap Implementations
Traps must be pre-programmed into Network Elements. They are not down line loaded to the network elements by the console.

SNMP uses a method called trap-directed polling. When an event causing a trap occurs, the managed node sends a single simple trap to the console. The console is responsible for initiating further interactions with the managed device to determine the problem. This is quite different from a polling approach, where each network element is constantly probed for status. It also minimizes management traffic on the network.

SNMP Management Concepts

SNMP Community
In the SNMP environment, a community is a relationship between SNMP agents and SNMP managers.

Each SNMP community is named by an NVT ASCII text string that is called the community name.

Community Views

Each managed device contains a community view. This view determines how much access (read only, read and write, or no access at all) the management console has for each given object.

Managed devices can belong to several communities at once. Each console can therefore have different views of the data contained in the managed device.

Security

The community name is a security feature in SNMP. For a console to reference a MIB or issue a set command, it must have the correct community name. Unfortunately, community names are not encrypted. Community names use the ASN.1 Display String (text) object type, which is transmitted in NVT ASCII. Someone monitoring the network with a packet analyzer could ascertain the community name in use by a particular console. IETF is currently working on a new security scheme for SNMP, which would encrypt community names.

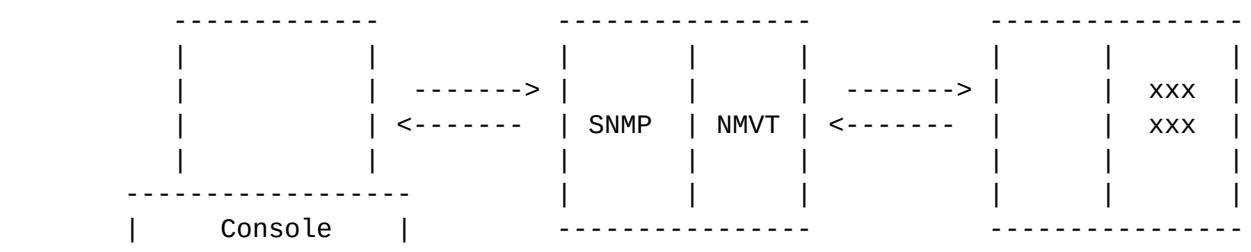
If the community name matches a name configured in the managed device, the console must have a correct view. As discussed earlier, this view determines if the console has read access, read and write access, or no access at all.

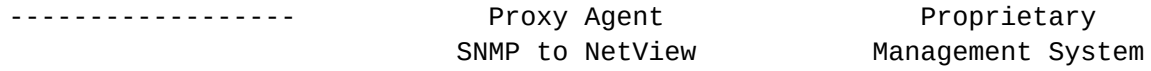
Managing "Foreign" Devices Using Proxy Agents

SNMP is independent of the architecture and mechanisms of particular hosts or particular gateways. SNMP can manage devices that do not conform to the architecture using Proxy Agents. Proxy agents allow SNMP to be used in environments that comprise multi-vendor devices using different protocols and different management schemes.

In the case of nodes that do not understand SNMP, a Proxy Agent can be used to translate one management protocol to another. An example would be a Proxy Agent that converts SNMP into Network Management Vector Transport (NMVT), the protocol used by IBM's NetView.

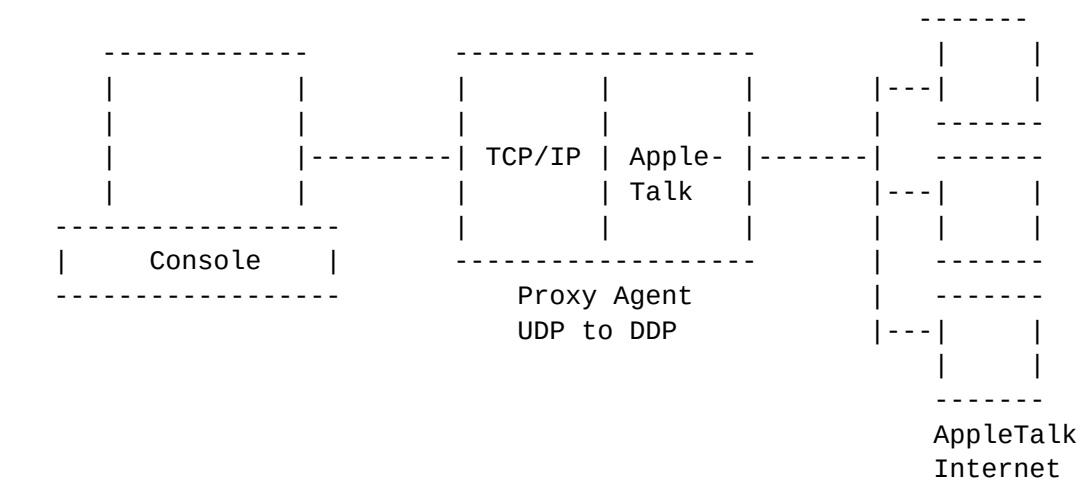
In the example below, the Proxy Agent is performing the aforementioned translation. An example is IBM's NetView 6000 running on an RS6000 platform, which implements SNMP translation for SNA networks. It is acting as an "application gateway."





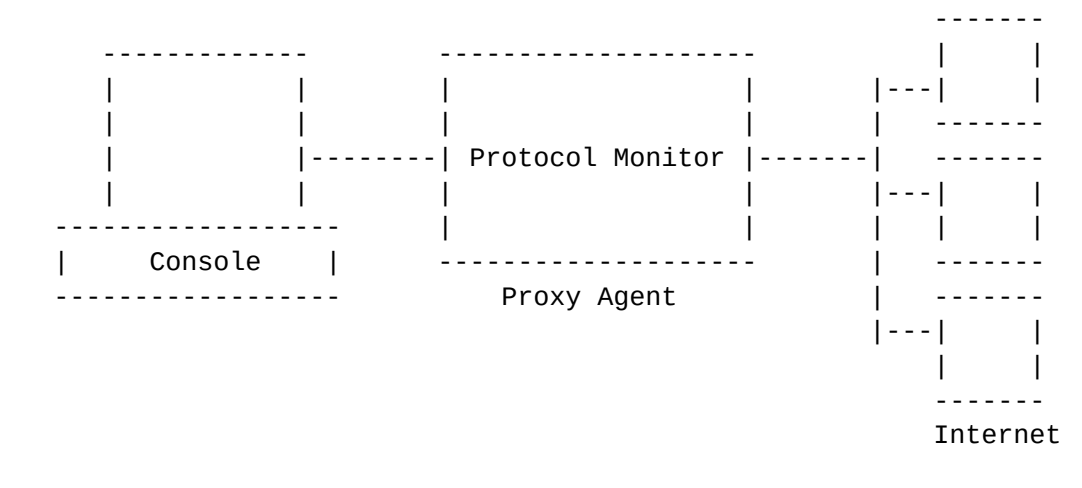
In the case of nodes that do not understand TCP/IP, but do support SNMP, a Proxy Agent can strip out the SNMP-specific data units and encapsulate them in another transport. A more complicated function of this type of agent is address remapping/resolution between the two networks.

Below is an illustration of a Proxy Agent that allows consoles using TCP/IP to manage AppleTalk networks using MacSNMP. This agent is acting as a "transport gateway" in standards parlance. Examples of this are the Cayman GatorBox, the Shiva FastPath, the Compatible System EtherRoute, and Cicso routers running release 9.0 gateway software.

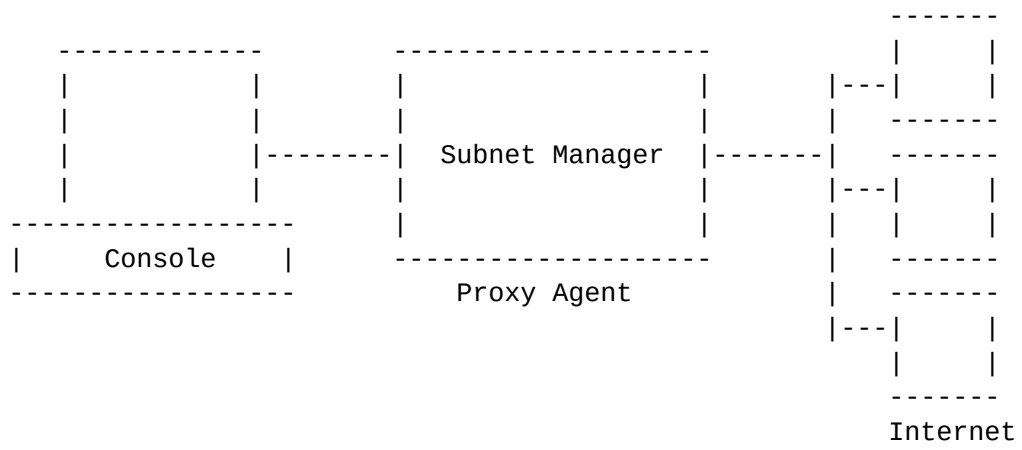


Other types of Proxy Agents can be used in SNMP networks. For example, Proxy Agents can sit on a network and monitor packet traffic, gather statistics, and send traps to consoles when certain conditions occur.

This is illustrated below. The console could then query these Proxy Agents to obtain their statistics, or to further analyze the trap condition reported. Examples are LANtern from Novell, Asante's network management hubs, and protocol monitor from Network General that also captures and decodes packets.



A Proxy Agent can be responsible for specific nodes on the network, monitoring them on behalf of the console and sending a high-level trap when something of interest happens. This is illustrated below.



This Proxy Agent has the added advantage of cutting down on network traffic, and frees the console from having to monitor a large number of nodes on a one-to-one basis. Subnet managers are under development by several vendors.

OSI vs. SNMP

SNMP and CMIP Differences

Many people are confused about the differences between SNMP and OSI's Common Management Information Services (CMIS) and its associated protocol, Common Management Information Protocol (CMIP).

Part of the confusion is that both protocols share some things in common. Both use Management Console/Agent architecture, and both use MIB structures to keep track of information -- but this is where the similarities end.

SNMP is a connectionless oriented protocol. Its commands and responses are transported with datagram transports like UDP and AppleTalk's DDP. These transports do not require formal session establishment between the manager and the managed to pass commands or responses. CMIP is a connection oriented protocol, requiring a session to be established between the manager and the managed to pass information. In the TCP/IP world, CMIP would use TCP as transport.

Another difference is the command set. CMIP uses Get and Set commands like SNMP, and has a command (similar to the SNMP Trap) called Event Report. The difference in the command set is that CMIP implements three additional commands: action, which can command a device to reboot for example; create, which is used to create new objects; and delete, which deletes objects.

One can duplicate the functions of these three commands in the SNMP world using the Set command to change a variable, which would then trigger an agent to perform specific programmed actions duplicating the function of action, create, and delete, but the SNMP command set does not support these

functions directly.

Additionally, CMIP uses a concept called scoping to locate a particular value by passing its locations and depth in the target node's tree. Further, these values can be filtered to segregate information.

What Is CMOT?

CMOT, short for CMIP Over TCP, implements the CMIP protocol in TCP/IP networks. Note the use of the connection oriented protocol, TCP, instead of UDP datagrams.

In Conclusion

The simplicity of the SNMP architecture and command structure has been discussed. It is a proven, established direction, with over 50 companies offering more than 200 networking products that support SNMP. SNMP is here today.

SNMP can be enhanced by extending the MIB to support product-specific features of different manufacture. This structure must be imported and compiled by the console to intelligently access different portions of a vendor-specific MIB.

Although SNMP seems simple on the surface, the detail is really in the MIB portion of the implementation, different than other management protocols with large detailed command sets.

SNMP has received some criticism in some areas. For instance, there is no capability defined to ensure that SNMP commands received by an agent really originated from an actual authorized management console. The IETF is working hard on improving security in SNMP, and this problem will be resolved shortly.

In the meantime, MIB variables can be protected by making them read only, but this will not allow the use of a Set command to change them. This lack of sophistication in authorization has made vendors reluctant to offer extensive functions that take advantage of SNMP's Set command. Hence, most routers are still configured with the vendor's own management utilities.

Additionally, the Trap command has caused practical problems in its implementation, as a managed device must constantly evaluate its function to determine if a trap should be executed, spending valuable CPU time and occupying memory in the process. In practice, this impact has proved to be relatively minor.

SNMP uses datagrams for transport. Datagrams do not provide delivery assurance. Messages can arrive out of sequence, or may be lost or duplicated. Most vendors implement a numbering scheme to address out-of-sequence conditions and duplications -- but messages can still get lost. On the other hand, when a network is in trouble, how can it be expected to support connection oriented sessions when the physical transport is unreliable?

In comparison to other network management proposals such as OSI's CMIP, SNMP is viewed by the OSI community to be not as versatile or applicable to a broad range of network products. In fact, some view SNMP as a "down-and-dirty fix" until CMIP is ready. And although SNMP's authors have done their best to map SNMP architecture into CMIP, they are incompatible.

However, SNMP's public domain distribution, relative ease of implementation compared to other network management scenarios, and its growing installed base make it a popular choice for users with multi-vendor networks.

Macintosh IIvx: New System Enabler Aids MIDI Transfers (9/94)

==========

Article Created: 21 January 1993
Article Reviewed/Updated: 26 September 1994

TOPIC ----------

System Enabler 001 version 1.0.1 corrects problems that a Macintosh IIvx may have with large transfers of MIDI data.

DISCUSSION ----------

Initially, the Macintosh IIvx encountered difficulty in receiving large System Exclusive (SysEx) transfers from other MIDI devices. This situation occurred due to interrupts being held inactive for periods longer than the MIDI protocol could handle without losing data.

This situation would not affect most SysEx transfers to the Macintosh IIvx, since a transfer could last for approximately 2.5 minutes without interruption. Since most MIDI devices can transfer all of their data in approximately 20-30 seconds, most MIDI devices would not encounter any difficulty. Samplers would be the most obvious exception. Because they transfer megabytes of data it would be possible to exceed the 2.5 minute time frame.

The issue has been addressed with the release of the enclosed System Enabler 001, version 1.0.1. This System Enabler for the Macintosh IIvx supersedes the earlier System Enabler 001, version 1.0.

System Enabler 001 version 1.0.1 easily allows a time frame of 5 minutes for a SysEx transfer. This is enough time for transfer 2MB of data from a MIDI device to the Macintosh IIvx. These are minimum specifications.

Standard 1MHz MIDI interfaces do not have any difficulty working with the Macintosh IIvx and the 1.0.1 version of the enabler. The use of faster MIDI interface boxes may cause the difficulty described above to reappear with the Macintosh IIvx even when used with the 1.0.1 version of the enabler.

PowerBook: Three Kinds of Batteries (6/94)

==========

Article Created: 11 November 1992
Article Reviewed/Updated: 9 June 1994

TOPIC ----------

Three different kinds of batteries are used in the various PowerBook models. This article describes which models use which kind of battery.

Each type of battery should be treated differently. A separate Tech Info Library article describes how to treat each battery type for maximum life. Also see the owner's guide for each PowerBook model.

DISCUSSION ----------

Battery Type	PowerBook Models
Sealed Lead Acid (SLA)	PowerBook 100
Nickel Cadmium (NiCad)	PowerBook 140, 145, 160, 165c, 170, 180, 180c
Nickel Metal Hydride (NiMH)	PowerBook Duo 210, 230, 250, 270c, 280, 280c PowerBook 520, 520c, 540, 540c

Article Change History:
9 June 1994 - Added PowerBook 280, 280c, 520, 520c, 540, 540c.
1 April 1994 - Updated formatting, added PowerBook 180c, Duo 250, and 270c.
16 March 1993 - Updated to add PowerBook 165c.

PowerBook: How the Serial Port Arbitrator Works

Revised: 5/31/94
Security: Everyone

PowerBook: How the Serial Port Arbitrator Works

==========

Article Created: 28 October 1992

TOPIC -----

What is the Serial Port Arbitrator, and how does it work? Can I take it out?

DISCUSSION -----

The serial port requires exclusive access. Through the use of arbitration, multiple applications can use the serial port. Consider the situation where Remote Access is waiting for a call and you want to use AppleLink. When Remote Access is waiting for a call, it has "passive claim" on the serial port which is relinquished when AppleLink needs the port. When AppleLink relinquishes its "active claim" to the serial port, Remote Access then reestablishes its "passive claim".

Therefore, if you remove the arbitrator AND have Remote Access set to answer calls, Remote Access will have sole claim on the port and not allow any other programs to use it. This is the only situation where you will encounter a problem.

QuickTime: QuickTime for Windows Description (9/94)

Revised: 6/5/96
Security: Everyone

QuickTime: QuickTime for Windows Description (9/94)

==========

Article Created: 11 November 1992
Article Reviewed/Updated: 8 September 1994

TOPIC ----------

QuickTime for Windows, a set of Windows Dynamic Linked Libraries (DLLs), can be installed on any PC and used by any Windows application adapted to QuickTime's application programming interface. The latest version of QuickTime for Windows is 1.1.1.

DISCUSSION ----------

With QuickTime for Windows, Apple has developed a cross-platform multimedia standard to provide users with a consistent interface and file format for working with digital video, sound, animation, and other multimedia data. Using QuickTime, authors and publishers will have a simple way to distribute their work in a single file format. QuickTime for Windows will also give multimedia programmers and developers one cross-platform multimedia programming interface.

QuickTime for Windows is an implementation of the QuickTime architecture on Microsoft's Windows environment. QuickTime for Windows provides Windows users with the portions of QuickTime needed to playback and control QuickTime Movie files and compressed still images. With the availability of QuickTime for Windows multimedia, authors, developers, publishers, and users can work with QuickTime Movies on Macintosh, Silicon Graphics, and PCs running Windows. Through QuickTime, users on Macintosh and Windows PCs will be able to easily exchange files, rely on a consistent human interface, and use a variety of modular compression technologies for storing multimedia information.

Support for add-in decompressors will allow third-party developers to add their own compression technologies to those already included with QuickTime for Windows. For instance, Apple and Intel are jointly integrating Intel's Indeo video compression technology into QuickTime on Macintosh and Windows.

New Features of QuickTime for Windows 1.1.1

QuickTime for Windows 1.1.1 offers improved performance, easier integration with existing Windows applications, and open extensibility for third-party developers.

Significance

QuickTime for Windows 1.1.1 provides significantly improved performance through support for Apple Compact Video, the advanced software compression technology introduced in QuickTime 1.5 on the Macintosh. Integration into existing Windows applications has been made easier through support for Windows 3.1 MCI (Media Control Interface) and OLE (Object Linking & Embedding) release 1.0. Support for customized add-in products enable third-party developers to add features such as custom decompression technology. Like QuickTime for Windows 1.0 and 1.1, version 1.1.1 includes the same QuickTime Movie file format, human interface, image decompression capabilities and programming interface as the Macintosh version of QuickTime, making it easier for developers to implement direct support of QuickTime in Windows applications.

Increased Performance

QuickTime for Windows 1.1.1 supports the advanced Apple Compact Video codec (compressor/decompressor), introduced in QuickTime 1.5 for Macintosh, that enables Movies to play either at twice the frame rate (up to 30 frames per second) or across four times the screen area (up to 320x240 screen size, software only) as supported by the earlier release. QuickTime for Windows 1.1.1 supports playback through video acceleration hardware, when used with display drivers that directly support QuickTime for Windows.

Windows Integration

Integration of QuickTime Movies into existing Windows applications is now easier with the support for MCI and OLE 1.0 in QuickTime for Windows 1.1.1. The new support for MCI integrates QuickTime for Windows into authoring and presentation applications for precise playback control. With OLE support, QuickTime Movies can be easily integrated into business applications that support OLE, adding impact with video footage, animation sequences and sound clips to documents, spreadsheets and presentations. Microsoft's Visual Basic 2.0 is also supported for creation of custom Windows multimedia applications using QuickTime.

Third-Party Hardware Support

Additional audio and video cards are supported in QuickTime for Windows 1.1.1, giving more Windows customers access to QuickTime technology. Digital video in QuickTime Movies is optimized for playback on display cards capable of showing from 256 colors (8-bit) to 16 million colors (24-bit).

Third-Party Software Support

Several software vendors have announced that they will support QuickTime for Windows in their products. Among those announcing are Adobe Systems; Corel Systems; Claris Corp.; Lotus Development Corp.; MacroMedia; and WordPerfect Corp. Additionally, several PC hardware and peripherals vendors have announced support for QuickTime for Windows in their products. The list includes

Creative Labs; Dolch Computer; and Media Vision.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Availability

QuickTime for Windows is bundled with various Windows and cross-platform multimedia CD-ROM titles, clip libraries, and applications. Apple offers QuickTime for Windows in a Software Development Kit (SDK) designed for professional programmers, and sold through the APDA, Apple's developer tools distribution group.

To receive a QuickTime Starter Kit, call 1-800-538- 9696, extension 175, to contact an Apple software reseller.

Requirements

QuickTime for Windows requires a minimum of a 386SX CPU running at 20 MHz, equipped with 4MB of RAM, an 80MB hard disk, and a VGA or better graphics card. Movies with sound require installation of a Windows-compatible PC sound card. Also required is MS-DOS 5.0 or later and Windows 3.1 or higher. A CD-ROM drive and graphics card displaying at least 256 colors are recommended.

Article Change History:

PowerBook 160 & Later: AutoRemounter, Display, & Battery (7/95)

Revised: 7/20/95
Security: Everyone

PowerBook 160 & Later: AutoRemounter, Display, & Battery (7/95)

==========

Article Created: 12 November 1992
Article Reviewed/Updated: 20 July 1995

TOPIC ----------

There are three files included with the PowerBook 160, 165c, 180, 180c, and 200 series (Duo) computers that are not included with the System 7.1 Personal Upgrade Kit or Update Kit. They are:

- Battery desk accessory has no visible difference with the one included with system 7.1.

- PowerBook Display control panel controls the backlight and the built-in video.

- AutoRemounter control panel remounts any file servers that were connected when the system went to sleep.

DISCUSSION ----------

These control panels are not included with System 7.1 because they are computer specific.

The only one of these that works on all PowerBooks is the PowerBook Display control panel. It lets the backlight go off, thus conserving power. The control panel has two features: dimming and video mirroring. The video mirroring is supported only on the PowerBook computers that support external monitors with the built-in video port. The dimming feature works on all the PowerBook computers, including the PowerBook 100, 140,145, and 170. All PowerBook users can take advantage of this power saving feature.

When turned on, AutoRemounter lets a PowerBook sleep without a warning dialog box appearing about losing network services. It also remounts any file servers that were connected when the system went to sleep. AutoRemounter works with all models except the PowerBook 100, 140, 145, 145B, and 170.

The PowerBook File Assistant collection of software includes AutoRemounter and the PowerBook Display control panel. This is available to all PowerBook owners.

LaserWriter Driver 7.x: Problem Printing Linked Files

Revised: 1/21/93
Security: Everyone

LaserWriter Driver 7.x: Problem Printing Linked Files

==========

Article Created: 20 January 1993

TOPIC ----------

A customer is having a problem when printing merged Extended PostScript (EPS) files from FrameMaker or Microsoft Word to a LaserWriter.

Using System 6 LaserWriter print drivers, they could print up to 10 EPS files at a time. Each file would be named "PostScript#" (where # is the number of the file, from 0-9).

When they use LaserWriter 7.x drivers in Microsoft Word, the first document is printed to a file and the remaining files are sent to the printer. When using the same drivers with FrameMaker, the system hangs or crashes.

DISCUSSION ----------

Printing linked or merged files is a known problem with the LaserWriter print drivers and is more fully discussed in Macintosh Technical Note #312. Here is a brief explanation of the problem:

The Printing Manager call, PrJobMerge, is responsible for printing merged or linked files. This call is implemented by the currently chosen printer driver. Since the printer driver may store job-specific printing information anywhere in the print record, only the printer driver can correctly merge this into a destination print record.

LaserWriter print driver version 7.x does not correctly merge all print job-related data (such as the number of copies requested) into the destination print record. As a result, the job may not print properly.

Also, in LaserWriter driver version 7.x, PrJobMerge destroys all the print job-specific information in the source print record after it fails to copy this information into the destination print record.

The best workaround is to unlink your files and print them separately.

AppleCD 300: New Features Require Application Support

Revised: 12/8/92
Security: Everyone

AppleCD 300: New Features Require Application Support

==========

Article Created: 25 November 1992

TOPIC ----------

How do I access the CD+G, CD+MIDI, and CD-XA file formats of the AppleCD 300 family of CD players? When I play a CD+G compact disc, the audio portion plays easily, but the graphics never appear.

DISCUSSION ----------

The ability to access the various CD formats provided in the AppleCD 300 family requires a software application that can send the appropriate instructions to the AppleCD 300.

The same situation exists with the ability to play standard audio CDs on an Apple CD-ROM drive: you must have CD Remote (or a similar piece of software) to allow an Apple CD-ROM drive to play audio CDs. The general principle is that if a software application does not support a particular feature, that feature is unavailable.

At the announcement of the AppleCD 300, there are no available applications that provide access to the CD+G, CD+MIDI, and CD-XA features of the AppleCD 300 series.

Macintosh: 16-bit to 8-bit Audio Conversion

Revised: 12/8/92
Security: Everyone

Macintosh: 16-bit to 8-bit Audio Conversion

==========

Article Created: 25 November 1992

TOPIC ----------

I'm recording some voice audio files to be played back into MacroMind Director. I record them in 16-bit audio with digidesign's AudioMedia card. I convert the files to 8-bit audio with MacroMedia's SoundEdit Pro. The converted sound is very low quality.

I realize that 8-bit has a smaller dynamic range than 16-bit, but the noise added isn't just a steady noise. The noise is a hissing sound that seems to rise and fall with the speakers voice.

Is this sound degradation expected? Are other programs or sound formats better at converting 16-bit to 8-bit audio? Are there any steps I can take to reduce this noise?

DISCUSSION ----------

Downsampling (moving from 16-bit to 8-bit and moving from 44.1 KHz to 22 KHz) is strictly a software operation. Therefore, it's the method of changing from one bit-per-sample/sample rate format to another that is introducing the noise.

Downsampling only the bits (16-bit to 8-bit) is generally not the part of the sequence that introduces the most noise. Although, any method of changing the bit-per-sample count will cause a change of character in the sound. The conversion from 44.1 KHz sampling rate to a 22 KHz rate creates the most opportunity for major introduction of noise. The downsampling of sample rates is more an art than a pure science; thus, different programs could easily produce quite different results.

We discussed the issue of using SoundEdit Pro for this procedure with the MacroMedia Tech Support group. They suggested that the downsampling take place within the software package where the sampling originated. For example, if the original digital recording is in AudioMedia's Sound

Designer, downsample in Sound Designer. Then use the resulting sound file in SoundEdit Pro and MacroMind Director.

Degradation should be expected during the downsampling. The exact form it takes will be based on which hardware/software elements are used to perform the task. Many sound engineers who must work with 8-bit sound record the original digital recording in 8-bit. This provides far less room for error than recording in 16-bit sound and then converting to 8-bit.

The introduction of noise isn't related to the file format, unless compression (that is, MACE) is used when the file is saved. Compression can easily add noise, and should be expected when compressing.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

DAL: Common F Messages Coming From VTAM DAL Server to a Client

==========

Article Created: 13 November 1992

TOPIC ----------

This article describes the most frequent F Messages coming from a VTAM DAL server to a client.

DISCUSSION ----------

VTAM errors are documented in the VTAM Installation Guide and these errors never get sent to the client. There are 'F Messages' which can come from the VTAM server to the client, and the most common are:

F000000001	Terminal I/O Error
F000000004	Invalid or Missing Userid
F000000008	Invalid or Missing Password
F000000012	Password has Expired
F000000016	New Password is Invalid
F000000020	User not defined to Group
F000000024	RACINIT Failed
F000000028	Access has been Revoked
F000000032	RACF not Active
F000000036	Group Access Revoked
F000000100	Userid in Use
F000000108	Server Terminated by Cancel
F000000112	Server terminated by Closedown

Personal LaserWriter LS: Minimum Print Margins in Legal Size

Revised: 7/6/93
Security: Everyone

Personal LaserWriter LS: Minimum Print Margins in Legal Size

==========

Article Created: 7 December 1992

Article Change History

07/01/93 - Updated
- Added requirements needed to achieve minimum margins

05/13/93 - Updated
- To describe how to achieve minimum margins

TOPIC ----------

What are the minimum size margins one can obtain with a Personal LaserWriter LS using legal size paper and "Larger Print Area" ?

DISCUSSION ----------

Here are the minimum margins achievable on a Personal LaserWriter LS using Legal sized paper:

Minimum top and bottom margins for Legal: .75 (3/4")
Minimum left and right margins for Legal: .25 (1/4")

Requirements:

.5MB or 1MB RAM
Personal LaserWriter 7.2 driver
Larger Print Area ENABLED in Page Setup

The Personal LaserWriter LS drivers (earlier than version 7.2) were designed for 1-inch margins to maintain compatibility with the Personal LaserWriter SC. Customers who upgrade the Personal LaserWriter SC to the Personal LaserWriter LS will not encounter

margin issues.

The earlier Personal Laserwriter LS driver had these minimum margins with Legal paper:

- Top And Bottom .750 Inches
- Left And Right .875 Inches

Note: The Personal LaserWriter LS 1MB RAM upgrade DOES NOT provide minimum TOP and BOTTOM margins of .25 inches.

AT&T and IBM Cable Types and Specifications (2/95)

Revised: 2/2/95
Security: Everyone

AT&T and IBM Cable Types and Specifications (2/95)

==========

Article Created: 18 November 1992
Article Reviewed/Updated: 02 February 1995

TOPIC ----------

I need basic information on cabling specs, features, and benefits for discussions with customers regarding the following cable types:

- AT&T type 1 through 5
- IBM type 1 through 5

DISCUSSION ----------

IBM

Here is the information on IBM cable types. There is no type 4, nor type 7.

Type 1: 2 shielded, solid wire, twisted pair, 22 AWG, heavy jacket. Available for plenum or non-plenum interior use, and underground or aerial exterior use. Use of Type 1 permits transmission at 16 Mbps, and a maximum of 260 stations, 33 MAUs per ring. Maximum lobe length is 330 feet.

Type 2: 2 shielded, solid wire, twisted pair, 22 AWG, plus 4 twisted pairs of solid 26 AWG wires added between the shield and the insulation cable sheath. Type 2 also supports 16 Mbps transmission.

Type 3: Unshielded, telephone grade (22 or 24 AWG) twisted pair, typically found inside a building. Requires a media filter at (or within) the NIC, and limits the transmission rate to 4 Mbps, and the number of workstations to 72.

Type 5: 100/140 micron fiber optic cable, used to connect distant MSAUs with fiber optic repeaters.

Type 6: Patch cables consisting of data grade, stranded, shielded twisted pairs, 26 AWG. When used, the distance limits are 66% that of Type 1.

Type 8: Under carpet cable, data grade twisted pair cable, 26 AWG. When used, the distance limits are 50% that of Type 1.

Type 9: Shield twisted pair, 26 AWG approved for plenum installations. When used, the distance limits are 66% that of Type 1.

AT&T

Unlike IBM's cable types, which can be non-twisted pair, AT&T types (more often referred to as Level) are all twisted pair cables.

Level 1: Used for voice and low speed data, digital and analog, RS-232.

Level 2: Unshielded twisted-pair, equivalent to IBM Type 3. Used in IBM 3270, IBM System 3X/AS/400.

Level 3: Shield or unshielded, equivalent to DEC's 10BASE-T, 4 Mbps token ring.

Level 4: Used for high-speed data, 100 ohm plus/minus 15%, 16 Mbps token ring, or extended distance 10BASE-T environments, at up to 20 Mbps.

Level 5: High speed LAN, 100 ohm plus/minus 15%, IBM data grade, used in all applications supported by levels 1-4 and 100 Mbps CDDI.

We are not sure there is much to discuss about features and benefits of the cable specifications. As you can see, different vendors might have different type definitions, they do have equivalence to other vendors' specifications or industry standards. Customers need to understand their network requirements and select the correct cable types to support it. Things to consider are voice or data, speed, and cost.

Powerbook Modem: International Questions 11/92

Revised: 5/16/94
Security: Everyone

Powerbook Modem: International Questions 11/92

==========

Article Created: 20 November 20 1992

TOPIC --

Four questions about PowerBook modems:

1) Can a U.S. customer order the international version of the modem (DAA jack)?

2) Is a cable adapter available to allow a DAA-based cable to connect to an RJ-11-based U.S. modem?

3) Does the AppleTalk Remote Access scripting kit provide details on scripting CCLs for international travel?

4) Is there a good source of information on international modem use?

DISCUSSION --

1) No, the International version of the modem can be purchased only overseas.

2) From a technical standpoint, the U.S. modem will work in many countries with the proper cable adapter: RJ-11 to local adapter. However, because the modem has not been adapted to meet local regulations nor certified by the appropriate agency -- Apple cannot recommend this solution. The same is true for the reverse scenario: using the international modem in the U.S.

3) The AppleTalk Remote Access Scripting Kit provides information only on how to create a CCL (modem script). Dealing with international connections requires more modem hardware knowledge in order to accommodate the country's phone system: for example, how to set the modem's registers appropriately to ignore the dial tone. The Appendix of the Macintosh PowerBook Modem User's Guide is a good place to start for information on configuring the modem.

4) To find the PTT international requirements, take a look at the CCITT Net 4 specification. It is a collection of all European PTT specifications and covers almost all the world (many countries recognize, or are close to, the Net 4 specification).

After Dark: Use 2.0.x or Later With PowerBook Computers (2/95)

Revised: 2/2/95
Security: Everyone

After Dark: Use 2.0.x or Later With PowerBook Computers (2/95)

==========

Article Created: 19 November 1992
Article Reviewed/Updated: 02 February 1995

TOPIC ----------

When using After Dark, the displays of the PowerBook 160, PowerBook 180, Duo 210, and Duo 230 aren't refreshing after Idle -- or the external monitor is not refreshing.

Has this issue been addressed?

DISCUSSION ----------

After Dark 2.0x is 100% System 7.1 compatible. This new version is a maintenance upgrade and addresses some minor incompatibilities and bug fixes. After Dark 2.0x includes a new installer application, along with the option to globally mute all sounds from within the After Dark Control Panel.

The PowerBooks power conservation features will make After Dark’s animation slow down dramatically, then disappear completely. The settings for these features are located in the PowerBook (formerly Portable) Control Panel. To turn off these PowerBook features so that After Dark’s animation can continue uninterrupted, please consult your PowerBook manual.

Article Change History

LaserWriter: What Happens to a Document After a Paper Jam

Revised: 12/14/92
Security: Everyone

LaserWriter: What Happens to a Document After a Paper Jam

==========

Article Created: 3 December 1992

TOPIC----------

What happens to the document being printed when a PostScript LaserWriter recovers from a paper jam?

DISCUSSION ----------

LaserWriter, LaserWriter Plus, LaserWriter IINT/NTX, Personal LaserWriter NT

After a paper jam is cleared, these printers discard ("flush") the page that was being printed when the printer jammed, then print the rest of the document.

Original LaserWriter IIf, LaserWriter IIg

The original LaserWriter IIf and LaserWriter IIg print two blank pages after a paper jam is cleared. This serves two purposes:

- To clean excess toner from the paper path
- To verify that a jam condition does not still exist before trying to image another page.

Unlike the earlier LaserWriter printers, the LaserWriter IIf and IIg re-print the page that was printing when the jam occurred.

Personal LaserWriter NTR, Upgraded LaserWriter IIf and LaserWriter IIg
---

A LaserWriter IIf or LaserWriter IIg that has had a ROM upgrade, and the Personal LaserWriter NTR, eject only one blank page before reprinting the remainder of the document. These printers also re-print the page

that was being printed when the paper jam occurred.

A/UX: Making Apple DoubleFormat the Default File Format (6/94)

Revised: 6/23/94
Security: Everyone

A/UX: Making Apple DoubleFormat the Default File Format (6/94)

==========

Article Created: 30 November 1992
Article Reviewed/Updated: 23 June 1994

TOPIC ----------

How can I set the A/UX Finder to AppleDouble Format?

DISCUSSION ----------

Under A/UX, you can change the default file-creation format to AppleDouble Format (instead of AppleSingle Format). The steps below describe how to override the default, so that A/UX creates files in AppleDouble file format:

1) Change the kernel Toolbox TBFILEFORMAT environment variable from 0 (for AppleSingle Format) to 1, as appropriate to your login shell:

   If the login shell is the Bourne Shell (sh) or the Korn Shell (ksh), insert the following lines into the user's .profile file:

```
TBFILEFORMAT=1
export TBFILEFORMAT
```

   If the login shell is the C Shell (csh), insert the following line in the user's login file (NOT in .cshrc):

```
setenv TBFILEFORMAT 1
```

2) Log out and log in again to activate the change.

3) On the Apple Workgroup Server 95 you can edit the file /mac/bin/mac32 in order to make Apple Double Format the default format.

Important: After making this change, all Macintosh applications files created will be in AppleDouble format. You can, however, use the "fcnvt" utility to convert such files to any desired format.

Macintosh Printing to HP LaserJet IIP on Novell Network

Revised: 12/22/92
Security: Everyone

Macintosh Printing to HP LaserJet IIP on Novell Network

==========

Article Created: 23 November 1992

TOPIC ----------

I have a Novell network on Ethernet. I have a Macintosh Classic connected to the Novell Network. I can make network connection to do file transfer to the Macintosh and running SoftPC and SoftNode to use the MS-DOS software on the server. The problem: I have an HP LaserJet IIP PCL-only printer with a serial and parallel port, connected to a node on the network through the parallel port. The file server is running Pserver as the print server, and sends any print jobs it receives to the printer node. The Macintosh cannot access the printer. Is there a way to get the Macintosh to print to the printer through the print server?

DISCUSSION ----------

You can get a software product such as Mosaic for Macintosh (from Insight Development Corp.), to print from your Macintosh to your HP LaserJet IIP printer. Below is a description of Mosaic for Macintosh, taken from Redgate.

Mosaic For Macintosh

Printer driver
Macintosh Plus or larger; 1MB of RAM; System 6.0 or later.

Mosaic for Macintosh allows Macintosh users to print documents from any application on HP LaserJet printers attached to a Novell network. Once Mosaic is installed, printing with HP LaserJet printers on a Novell network becomes transparent to users. Using the Chooser, users select the appropriate Novell queue and destination HP printer. When these selections have been made, Mosaic sends the print jobs directly to the designated NetWare queues. Mosaic is compatible with Novell's NetWare Desk Accessory, which provides users with information about print jobs and allows them to hold or delete jobs that have been submitted to the file server. Mosaic is

System 7 compatible and fully supports TrueType fonts.

AppleShare 3.0, 3.0.1: Prob with ARA & Retrospect Remote (9/95)

Revised: 9/19/95
Security: Everyone

AppleShare 3.0, 3.0.1: Prob with ARA & Retrospect Remote (9/95)

==========

Article Created: 25 November 1992
Article Reviewed/Updated: 19 September 1995

TOPIC -----

This article describes a known bug and its solution in AppleShare 3.0 or 3.0.1 when used with AppleTalk Remote Access and Retrospect Remote Control Panel software.

DISCUSSION -----

There is a known bug in AppleShare Server 3.0 & 3.0.1 which is fixed in AppleShare Server 3.0.2. AppleShare 3.0.3 is the current release and should be used. Here are the details:

Macintosh systems that have the following software installed are affected:

AppleShare File Server 3.0 or 3.0.1
AppleTalk Remote Access 1.0
Retrospect Remote Control Panel

If the entire system is backed up with Retrospect Remote, subsequent attempts by AppleTalk Remote Access users to dial in to that system will fail with an "Unrecognized User" error message. The immediate, albeit temporary, solution is to restart the server Macintosh.

The solution is to use the AppleShare 3.0.3 Patch Program to update AppleShare 3.0 or 3.0.1 file servers to version 3.0.3. The AppleShare 3.0.3 Patch Program is available on Apple Computer's online services. These articles can help you locate the AppleShare 3.0.3 Patch software mentioned here:

• "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.

• "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the

Apple Tech Info Library.

The previous workaround was to not back up the Users & Groups file with Retrospect Remote.

To locate Dantz's (the maker of Retrospect) address and phone number, search the Tech Info Library article titled "Locating Vendor Information" for help.

Article Change History:
19 Sep 1995 - Updated article to AppleShare 3.0.3 Patch software.

At Ease 1.0: Animation Locks Up in Mouse Practice

Revised: 12/1/92
Security: Everyone

At Ease 1.0: Animation Locks Up in "Mouse Practice"

==========

Article Created: 1 December 1992

TOPIC -----

I have a problem with "Mouse Practice" (At Ease 1.0). After running a while, the animation locks up when I click on the Sea Horse during the underwater sequence.

Configuration:

- Macintosh LC II 4/40
- 256 colors on a 12-inch display
- System 7.0.1

DISCUSSION -----

This is a problem with the amount of memory allocated to the application. If you look at Get Info under the File menu for the application, you'll find the allocated memory is 5000K. It's set this way from the factory. Lower it to the recommended 2048K. This has cleared up the problems that we have seen.

AppleTalk Remote Access: How to Set a Password Remotely

Revised: 12/11/92
Security: Everyone

AppleTalk Remote Access: How to Set a Password Remotely

==========

Article Created: 1 December 1992

TOPIC ----------

Is there a way to change my password remotely when using Apple Remote Access?

DISCUSSION ----------

Yes, you can change your password remotely, but it's not an "intuitive" process. The key is to understand that AppleTalk Remote Access uses the Users & Groups file on the system acting as the AppleTalk Remote Access server.

The first step is to allow you, the user, to change your password. If you are running AppleShare 3.0 on the same system that AppleTalk Remote Access is running on, use the AppleShare Administration program to set this option. (The reason is that AppleShare converts the Users & Groups file to an AppleShare format.)

1) With System 7 Personal File Sharing on (through the File menu's "Sharing..." item), go to the User's & Groups control panel and click the icon bearing your name.

2) Make sure the "Allow user to change password" box is checked.

Important: If the ARA server is separate from the servers you are accessing remotely through ARA, you must mount a volume from the ARA server to be able to change the password.

As of November 1992, the only solution is to set up file sharing on the ARA server and allow yourself (and perhaps other users) to mount the server. You don't have to give access to the entire volume; you could create a folder with read-only access and only share it. This way, you

could log on to the ARA server and change your password without having access to information on the server.

The password-changing capability works when you mount a volume with the AppleShare icon in the Chooser. When you select the server, you will notice the set password button. If the ARA server is not doing any AppleShare work, personal file sharing, or server activities, then you cannot mount the server that would let you change your password.

DAL for VTAM: Documentation for Writing SMF Exit

Revised: 12/14/92
Security: Everyone

DAL for VTAM: Documentation for Writing SMF Exit

==========

Article Created: 1 December 1992

TOPIC ----------

We're testing DAL for VTAM and want to write our own SMF Exit -- however, we're looking for documentation on how to program our own Exit. (The only information we have is from the ReadMe file on the installation tape.) We don't need to know how to program an SMF Exit. We need more detail about the fields and values from DAL than what is specified in the ReadMe file.

For example, we noticed a field called "db2time" -- what time is this? Is it an accumulated value? Are there explanations about the fields and values coming from the DAL (VTAM) server in the DAL documentation? If there is, where can we find them?

DISCUSSION ----------

The SMF exit refers to an IBM product, SMF (System Management Facility). SMF tracks resource usage under MVS and reports on it with a number of report formats.

DAL supports the collection of the standard items of data that people usually want to report. The ReadMe on the installation tape specifies the fields that will be returned (and the order in which they occur), if you wish to write your own exit to request the data. DAL does NOT give any information on how to write such an exit. It requires an Assembler programmer who is familiar with SMF -- at the very least.

There isn't any written documentation about the use of the exit other than the ReadMe file on the Installation Tape. The DAL SMF exit is called at each user's logon and logoff. The "times" will be zero at logon, and total amounts at logoff.

Netware: Login Problem

Revised: 4/20/93
Security: Everyone

Netware: Login Problem

==========

Article Created: 1 December 1992

Article Change History

04/19/93 - REVISED
- To better describe the Netware UAM.

TOPIC ----------

I just installed Netware for Macintosh 3.xx. I was able to see the server show up in the Chooser and type in the customer's login name. When I entered the password, the system responded with "The password is incorrect. Please re-enter password." The customer entered the same login and password at his PC and logged in successfully. Any ideas on what's wrong?

DISCUSSION ----------

It sounds as if the server is expecting an encrypted password from the Macintosh. You either need to use the Netware UAM (it comes with Netware for Macintosh software) on the Macintosh which allows encrypted passwords, or from the file server console type "unencrypted password = on" if using the AppleShare workstation software.

Another option is to log on as a guest, if guest access to the server is allowed.

DAL Server for VMS: Ingres Group Permissions Supported

Revised: 12/14/92
Security: Everyone

DAL Server for VMS: Ingres Group Permissions Supported

==========

Article Created: 1 December 1992

TOPIC ----------

A University is using DAL to access student record information located on a VAX in Ingres. They are thinking of rolling this out to a large community of users, but would like to use the Ingres group permissions to apply permissions to different groups in the organization. Can Apple support this in DAL?

DISCUSSION ----------

With the 1.3.6 release of the DAL server for VMS, group permissions in Ingres is supported. To use it, the Ingres Knowledge Management Extension is also required. The DAL Open Database command can be in either of the following formats:

- Open Database "databasename -Ggroupid" (a space is required BEFORE the -G and no space is allowed between the -G and the groupid).

- Open Database "databasename" as user "userid -Ggroupid" (a space is required BEFORE the -G and no space is allowed between the -G and the groupid).

Either of these formats will cause the "EXEC SQL CONNECT" command, generated by DAL to Ingres, to include the "OPTIONS = -Ggroupid" parameter.

This has not been tested here, since we do not have the Knowledge Management Extension. However, since it is similar to the Roles format, which we know works, we expect it to work also.

PowerBook 200 Series: Third-Party Internal Fax/Modem (9/95)

Revised: 9/19/95
Security: Everyone

PowerBook 200 Series: Third-Party Internal Fax/Modem (9/95)

==========

Article Created: 11 January 1993
Article Reviewed/Updated: 19 September 1995

TOPIC----------

Is there a third-party internal fax/modem available for the Macintosh PowerBook 200 (Duo) series computers?

DISCUSSION----------

There are several fax/modem options available to owners of the Macintosh PowerBook 200 series computers. You can use a third party internal modem, an Apple internal modem or an external modem.

We aware of only one third-party internal fax/modem available for these computers which is the Global Village PowerPort Mercury for the PowerBook Duo fax/modem. The Apple solution is the PowerBook Express Modem (finished good part number M4186LL/A). If you would rather not install an internal modem, an external fax/modem can be connected through the external serial port.

Apple IIe Card: How to Save Information to a Hard Drive

Revised: 12/9/92
Security: Everyone

Apple IIe Card: How to Save Information to a Hard Drive

==========

Article Created: 4 December 1992

TOPIC ----------

How do you specify applications on the IIe card to save on a hard drive with a ProDOS partition?

DISCUSSION ----------

There are two different methods of specifying the hard drive when saving applications on the Apple IIe or, in this case, the Apple IIe card. A ProDOS device is designated by a physical location and by path name. The physical location on an Apple IIe is determined by the physical location of the SCSI card.

On the Apple IIe card, use the control panel to configure where the hard drive partition is going to be phantomed to. This is done for software compatibility. If you look in the Apple IIe control panel slot assignments, you will find a hard-drive icon. When you place the hard drive in a slot (virtual, not physical), you assign how the drive will be accessed when referred to in the physical convention.

In other words, the Apple IIe card doesn't have any physical slots but has to emulate the Apple IIe. You use the control panel to configure how the software will see the Apple IIe card.

In ProDOS, the commands for saving a BASIC file are:

Physical Designation

```
    Save Programname, S7,D1    <---- S7 equals slot 7, D1 = Drive 1
                                     Change the slot number, Sx to your
                                     configuration.
```

Pathname Designation

Save VolumeName/ProgramName	If your hard drive were named ProDOS, you would type Save ProDOS/ProgramName

ProDOS also supports nested folders. All you would have to do is to specify the complete path name, such as VolumeName/Pathname/ProgramName

These commands are all from BASIC. Within an application, you will need to determine what the program is asking for. If it asks for slot and drive, type the slot you configured the hard drive for. If it is asking for path information, type the pathname.

NOTE. The above information applies only to ProDOS. Apple DOS, the original operating system for Apple II computers, does not support hard drives.

QuickTime 1.0 and 1.5: User Tips

Revised: 12/8/92
Security: Everyone

QuickTime 1.0 and 1.5: User Tips

==========

Article Created: 4 December 1992

TOPIC ----------

This article describes user interface commands for QuickTime.

DISCUSSION ----------

In any QuickTime movie window that uses the standard movie controller, you can hold down the Control key and click in one of the single-step buttons at the right end of the controller. A tiny slider bar appears which you can then drag to play the movie at variable speed forward or backward.

Here are some other control commands that work in standard QuickTime movie windows.

Double-click on image	= play
Single-click on image	= pause
Shift-double-click on image	= play backward
Left, Right arrows	= single step
Up, Down arrows	= volume
Space, Return	= toggle play/pause
Option-click on speaker icon	= toggle sound mute
Shift-drag the play bar	= select section of movie

Finally, a good way to select a section of a QuickTime movie:

1) Position yourself at the start of the selection.

2) Hold down the Shift key, and type Space or Return.

3) When the movie starts playing, select the played portion as it goes by.

4) When you release the Shift key, the movies stops playing and the played

portion is selected.

Macintosh and ISDN Access via Access Privilege Products

Revised: 12/11/92
Security: Everyone

Macintosh and ISDN Access via Access Privilege Products

==========

Article Created: 4 December 1992

TOPIC ----------

This article describes three products from Access Privilege. They allow Macintosh users access to ISDN (Integrated Service Digital Networks).

DISCUSSION ----------

Access Privilege has announced the availability in the United States of three ISDN products: The Planet-ISDN NuBus card, TheLink, and EasyTransfer software. Macintosh users can now transfer a 1MB file between San Francisco and New York on a single ISDN line in less than a minute, while talking to the person at the other end of the line. A company based in Atlanta can reliably interconnect its AppleTalk network with the corresponding networks in its European and Japanese subsidiaries. A Marketing Manager in New York can set up a video conference with sales representatives in Washington, Miami, or Boston through his Macintosh. There are already several companies in Europe, Australia, and Japan making use of these solutions in their daily work.

- Planet-ISDN, is a NuBus card designed by EuRoNIS, an Access Privilege subsidiary company, to connect the Macintosh to national and international ISDN. Planet-ISDN is available in 18 countries and is now compatible with ISDN-1, the American standard adopted by AT&T, Northern Telecom, and Siemens Stromberg-Carlson, for which conformance tests have been passed at Bellcore. Planet-ISDN is compatible with Apple Computer Inc.'s Communications ToolBox and Telephone Manager.

- TheLink, created by a partnership between Apple Computer Inc. and Access Privilege, is the only software solution capable of transparently interconnecting remote AppleTalk networks (LocalTalk, EtherTalk and TokenTalk) through ISDN and X25. TheLink provides access to various services present on all networks according to privileges defined by the

administrators. TheLink is compatible with the Communications ToolBox, working naturally with the Planet-ISDN board.

- EasyTransfer is software developed by Access Privilege for exchanging files or folders between remote Macintoshes through ISDN. It can be used with no special telecommunications knowledge. Its protected protocol, incorporating APC compression, optimizes transfers. Transfer speeds of up to 190 kbs/s have been achieved on a 64 kbs/s ISDN B channel using EasyTransfer and the Planet-ISDN board. EasyTransfer is compatible with the Communications ToolBox.

Planet-ISDN is a registered trademark of EuRoNIS. TheLink, EasyTransfer, and APC are registered trademarks of Access Privilege. For contact information, search the Tech Info Library for Access Privilege.

PowerBook: Storage Temperature Correction (12/93)

Revised: 5/16/94
Security: Everyone

PowerBook: Storage Temperature Correction (12/93)

==========

Article Created: 22 December 1993

TOPIC ----------

According to Apple Portable Engineering, the storage temperature specifications in some PowerBook manuals are incorrect. This article provides a correction.

DISCUSSION ----------

All PowerBook models from the 1xx series to the Duos have a storage temperature range from -40° C to +65° C.

PowerBook Duo Floppy-disk Adapter: Hole for Security Lock 12/92

Revised: 5/16/94
Security: Everyone

PowerBook Duo Floppy-disk Adapter: Hole for Security Lock 12/92

==========

Article Created: 7 December 1992

TOPIC ----------

There's a hole in the PowerBook Duo floppy-disk adapter. What's it for?

DISCUSSION ----------

The hole is for installing a Kensington lock, which disables the button from being depressed. This keeps the floppy adapter from being removed from the Duo. However, it does not lock the external drive from being removed from the floppy adapter.

CD-ROM Drives: Why They're More Expensive than CD-Audio (9/95)

Revised: 9/7/95
Security: Everyone

CD-ROM Drives: Why They're More Expensive than CD-Audio (9/95)

==========

Article Created: 9 December 1992
Article Reviewed/Updated: 7 September 1995

TOPIC ----------

Why are CD-ROM drives more expensive than CD-audio ones?

DISCUSSION ----------

The key factors in the high cost of a CD-ROM drive, compared to a CD-audio counterpart, are:

- Speed
- Reliability and Performance
- Longer Warranty
- Economy of Scale
- Additional Electronics

Speed

Faster drive performance in a data environment increases productivity, whereas audio has to be played at a constant rate.

Reliability and Performance

CD-ROM drives are used in data environments which stress reliability and performance. Unlike CD-audio use, where losing a note of music may not even be heard by the listener, in a data environment not reading data accurately may be catastrophic. Additional electronics are needed to ensure data reliability.

Warranty

The typical CD-audio drive is warranted for 30 days. For CD-ROM drives, the warranty period is generally at least one year. The longer warranty period requires the use of more reliable and durable, and hence more expensive

components in CD-ROM drives. Also, many CD-ROM drives are purchased by major OEM customers who have stringent quality and reliability standard, which demand the use of more durable and more expensive components.

Economies of Scale

CD-audio drives are produced in the millions of units per month and can leverage off such large quantities. CD-ROM drives, however, are manufactured in smaller quantities, and the special components necessary, therefore tend to be more expensive.

Additional Electronics

The spindle motor (which rotates the disc). Most CD-ROM drives use brushless DC motors, which provide greater durability and reliability than the less-expensive brush motors that are used in most CD-audio drives. The CD-ROM motor typically has a MTTF (mean time to failure) in excess of 10,000 hours (the AppleCD 150 and other Apple CD-ROM drives are specified at 25,000 hours at a 100% duty cycle). The CD-audio brush motors, on the other hand, do not even typically have MTTF requirements: reliability is usually defined in the hundreds of hours, an extreme case being 1,000 hours.

The actuator (which determines the access time). Access time is a critical factor in data devices. In CD-ROM drives, typically a rack-and- pinion or linear motor type of actuator is used to provide access times of less than 500 ms (the AppleCD 300 has an average access time of 295 ms). In CD-audio drives, access time is unimportant, so cheaper, slower actuators are used. The actuator life in a CD-ROM drive must be substantially over 1 million back-and-forth seeks, while for a CD-audio drive one hundred thousand is more than adequate. Thus, a cheaper, less durable mechanism can be used for CD-audio.

CD caddy. In order to protect the disc from mishandling and misread data, many CD-ROM drives use a CD caddy to load the disc into the drive. This means that an additional caddy-loading mechanism is needed in such CD-ROM drives. CD-audio drives do not use caddies, because the loss of music is not catastrophic, as is the loss of data. As the CD-ROM industry gets more experience with CD-ROM disc reliability, there will be a trend to do away with the use of the CD caddy, as is evidenced in some newer, less-expensive CD-ROM drives.

Heavy-duty power supply. A drive with a faster access time and quicker spin-up time requirements, needs a larger, more powerful power supply, which results in additional cost for an external CD-ROM drive. A CD-audio drive can run off ordinary AA batteries, because access time is unimportant.

Error detection circuitry. The need for data reliability requires extra error-detection and error-correction electronics, which are not needed in CD-audio environments.

SCSI controller. An additional SCSI controller (or a comparable interface)

is needed to connect a CD-ROM drive to a computer. This is not needed for a CD-audio drive. For external CD-ROM peripherals, two SCSI connectors are typically provided.

Data buffer. To improve data transfer rates in CD-ROM drives, a data buffer is usually used -- typically 32KB or more (the AppleCD 300 has a 256KB buffer) -- resulting in additional cost. No such buffers are needed for CD-audio.

Apple Software: Current Versions (10/96)

Revised: 10/14/96
Security: Everyone

Apple Software: Current Versions (10/96)

==========

Article Created: 7 December 1992
Article Reviewed/Updated: 9 October 1996

TOPIC ----------

The table below lists versions of SHIPPING Apple software products and provides the following information for each:

Version

The current version number.

7.5.3 rev 2?

Whether the product is supported with System Software 7.5.3 rev 2 (SSW 7.5.3 rev 2).

Some products, are listed as unsupported, but may be fully compatible. For example, TeachText is listed as not supported with System 7.5, because it has been replaced by SimpleText. This does not necessarily mean that TeachText does not work with System 7.5.3 rev 2.

Notes

Additional information on the product

Additional articles in the Tech Info Library describe many of the products listed below more fully. This article does not cover any announced Apple products which are not currently shipping.

DISCUSSION ----------

Begin_Table

Product	Version	7.5.3 rev 2	Notes

32-Bit System Enabler	1.0.3	NO	For Mac II, IIx, IIcx, SE/30; Use MODE32 version 7.5
8*24 GC (Extension)	7.0.1	NO	Not Compatible with PowerMac
950 Color Addition	1.0	NO	Unnecessary with SSW 7.5
A/UX	3.0.1	NO	
A/UX	3.1	NO	Only supports the AWS 95.
A/ROSE	1.2.2	YES	Ships with SSW 7.5.3 rev 2
ADSP	1.5.1	NO	Not required, part of SSW 7.0 & higher
Apple IIe Card SW	2.2.1d1	YES	
Apple Backup	1.4	YES	Ships with SSW 7.5
Apple Built-In Ethernet	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Apple Color Printer	1.0	YES	See TIL article on GX drivers
Apple Ethernet CS	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Apple Ethernet LC	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Apple Ethernet NB	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Apple DocViewer	1.1.1	YES	Apple Extras folder of Power Macs
Apple Event Manager	1.0.3	NO	Not necessary w/ SSW 7.5.3 rev 2
Apple File Exchange	7.0	NO	Use PC Exchange, which ships w/SSW 7.5.3 rev 2
Apple Font Pack	1.0	YES	See separate article in Tech Info Library for contents of Font Pack
Apple HD SC Setup	7.3.5	YES	Ships with SSW 7.5.3 rev 2
Apple Guide	2.0.2	YES	Ships with SSW 7.5.3 rev 2
Apple Internet Router	3.0.1	YES	Install before NSI 1.4.5
Apple LAN Utility	1.0b4	YES	Posted online-non supported software area
AppleLink	6.1	YES	Contact Apple Online Services
Apple Media Tool	2.0	YES	
Apple Menu Options	1.1.2	YES	Ships with SSW 7.5.3 rev 2
Apple MIDI Manager	2.0.2	YES	APDA Developer's tool, posted online
Apple MIDI Driver	2.0.2	YES	APDA Developer's tool, posted online
Apple Modem Tool	1.5.5	YES	
Apple Personal Diagnostics	1.1.3	YES	Updater from 1.1 online
Apple Phone	1.0.1	NO	Application bundled with AV models
Apple Photo Access	2.1	YES	Ships with SSW 7.5.3 rev 2
Apple Printer Utility	2.0	YES	Part of LaserWriter 8.3, posted online
Apple Remote Access	2.1	YES	Separate Client, Personal Server & Multiport Server versions.
AppleScript	1.1	YES	Ships with SSW 7.5.3 rev 2
AppleSearch Client	1.5	YES	
AppleSearch Client (Win)	1.0	N/A	For Windows
AppleSearch Server	1.5.1	YES	
AppleShare Client (Win)	1.0.2	N/A	For Windows
AppleShare File Server	4.2.1	YES	4.0.2 or later required w/ SSW 7.5
AppleShare Print Server	4.2.1	YES	This version required w/ SSW 7.5

Apple Shared Lib. Mgr.	1.1.2	YES	
AppleTalk (driver)	v.60.1	YES	Ships with SSW 7.5.3 rev 2(If using Open Transport 1.1; Classic AppleTalk version remains 58.1.5)
AppleTalk ImageWriter	7.0.1	YES	Ships with SSW 7.5
AplTalk ImageWriter LQ	7.0.1	YES	Ships with SSW 7.5
Apple Telecom	2.3.3	YES	Ships with SSW 7.5.3 rev 2
Apple Video Player	1.4	YES	For Performa 6xx TV/Tuner Card
AppleVision Display SW	1.0.4	YES	Supports AppleVision & AudioVision Displays on System 7.5.x computers
Assistant Toolbox	1.3	YES	Ships with SSW 7.5.3 rev 2
At Ease	3.0	YES	Available from Claris
At Ease for Workgroups	3.0.2	YES	Patch Available online
Audio Volume	1.1	YES	Available online
AudioVision (extension)	1.0.2	NO	Extension for AudioVision 14 Display
Auto Power On/Off	1.0	YES	Ships with SSW 7.5.3 rev 2
AutoRemounter	1.2	YES	Ships with SSW 7.5.3 rev 2
AV Serial Extension	1.0	NO	Unnecessary with SSW 7.5.3 rev 2
AW Server 95	1.1	NO	Part of AWS 95 Update 1.1
AWS 95 Tune-Up	1.0	NO	System update disks (2) for the Apple Workgroup Server 95
Basic Color Monitor	1.0	NO	Unnecessary with SSW 7.5.3 rev 2
Basic Connectivity Set	1.1.1	YES	
Battery DA	7.1.1	NO	Part of control strip in SSW 7.5.3 rev 2
Battery Recondition	1.3	YES	Ships with SSW 7.5.3 rev 2
CD-ROM Setup	5.1.7	YES	Posted online
Chinese Language Kit	1.1.1	YES	See separate TIL article, Chinese Language Kit: Frequently Asked Questions
Chooser	7.5.4	YES	Ships with SSW 7.5.3 rev 2
CloseView	7.2.1	YES	Ships with SSW 7.5.3 rev 2
Color Picker	2.0.1	YES	Ships with SSW 7.5.3 rev 2
Color SW 2400	2.1.1	YES	Ships with SSW 7.5.3 rev 2
Color SW 2400 GX	1.0.1	YES	Installed by Quickdraw GX 1.1.2
Color SW Pro	1.5.2	YES	Ships with SSW 7.5.3 rev 2
ColorSync	2.0.1	YES	Ships with SSW 7.5.3 rev 2
Control Strip	1.3.1	YES	Ships with SSW 7.5.3 rev 2
CPU Energy Saver	1.0.6	YES	Ships with SSW 7.5.3 rev 2
Curare	1.0	NO	No longer offered by APDA
Cyberdog	1.1	YES	
DAL Software	N/A	N/A	Not Apple software, contact ITI
DART	1.5.3	NO	Not Apple software
Desktop Printer Ext.	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Desktop PrintMonitor	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Desktop Printer Spooler	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Disk Copy	4.2	YES	Ships with SSW 7.5.3 rev 2
Disk First Aid	7.2.2	YES	Ships with SSW 7.5.3 rev 2
Display Enabler	2.0	NO	Obsolete-changes included in SSW 7.5.3 rev 2
DocViewer	1.1.1	YES	

DOS Compatibility SW	1.5	YES	Available online.
Drive Firmware Update	1.2	YES	Available online.
Drive Setup	1.0.5	YES	Available online.
Duo Battery Patch	1.0	NO	Unnecessary with SSW 7.5.3 rev 2
Easy Access Ctrl Panel	7.2	YES	Ships with SSW 7.5
Energy Saver	1.1	YES	Ships with SSW 7.5.3 rev 2
EtherTalk	2.5.7	YES	Ships with SSW 7.5.3 rev 2
Express Modem**	2.3.3	YES	Control panel for Express Modem and GeoPort
Express Modem Tool**	2.3.3	YES	CTB Extension for Express Modem, GeoPort
Express Modem ARA 1.x**	2.3	YES	AppleTalk Remote Access CCL file
Express Modem ARA 2.x**	2.3	YES	AppleTalk Remote Access CCL file
Express Modem CCL**	2.3	YES	AppleLink CCL file
Extension Manager	3.0.3	YES	Ships with Display SW 1.2
Fax Extension**	2.3.3	YES	PB Modem, Express Modem, GeoPort
Fax Sender**	2.1	YES	PB Modem, Express Modem, GeoPort
Fax Sender GX**	2.3	YES	PB Modem, Express Modem, GeoPort
Fax Terminal**	2.3.3	YES	PB Modem, Express Modem, GeoPort
Fax Viewer**	2.3.3	YES	PB Modem, Express Modem, GeoPort
Fax Cover**	2.3.3	YES	PB Modem, Express Modem, GeoPort
Font/DA Mover	4.1	NO	Unnecessary with SSW 7.5.3 rev 2
GeoPort Extension	2.3.3	YES	See Apple Telecom 2.3 above
GeoPort for Power Mac	2.3.3	YES	See Apple Telecom 2.3 above
Hardware System Update	2.0.1	NO	Obsolete-changes included in SSW 7.5.3 rev 2
HyperCard	2.3	YES	APDA Product, avail from resellers; 2.3.5 Update available online
HyperCard Player	2.3.5	YES	Ships with Display SW 1.2
HyperScan	2.0.1	YES	OneScanner
ImageWriter	7.0.1	YES	Ships with Display SW 1.2
ImageWriter GX	1.1.1	YES	Installed by Quickdraw GX 1.1.2, replaced 1.0.1
ImageWriter LQ GX	1.1.1	YES	Installed by Quickdraw GX 1.1.2, replaced 1.0.1
Installer	4.0.3	YES	Ships with SSW 7.5
Inter*Poll	1.0.1	NO	Not supported w/ SSW 7.5.3 rev 2
Internal HD Format	1.3	YES	For use with IDE Drives Only, posted online
Japanese Language Kit	1.2	YES	From Apple Order Center
LaserWriter	7.2	YES	Ships with SSW 7.5
LaserWriter 8	8.3.4	YES	Ships with SSW 7.5.3 rev 2
LaserWriter Bridge	2.0.1	YES	Ships with NSI 1.5.1
LaserWriter GX	1.1.2	YES	Installed by Quickdraw GX 1.1.2, replaced 1.0.1
LaserWriter IISC GX	1.1.1	YES	Installed by Quickdraw GX 1.1.2, replaced 1.0.1
LaserWriter Utility	7.7	YES	Ships with SSW 7.5
LaserWriter Select 300	1.2	NO	Use LaserWriter 300 driver
LaserWriter 300	1.2	YES	Ships with SSW 7.5
LaserWriter 300 GX	1.1.1	YES	Installed by Quickdraw GX 1.1.2, replaced 1.0.1

LaserWriter Select 360	1.1	NO	Use LaserWriter 8.3.3 driver
LaserWrtr Select 360 Fax	1.1	NO	Use LaserWriter 8.2.3f driver
Likewise	1.0.1	NO	Discontinued 12/93
LocalTalk Bridge	2.0.1	YES	
LW Select 310	7.0.1	YES	Ships with SSW 7.5
MacApp	3.0.1	YES	APDA Product
MacCheck	1.0.5	NO	Discontinued
MacinTalk Pro	1.4	YES	Ships with Text-to-Speech software 1.4.1
Macintosh Basics	5.0	NO	Mac Tutorial is included in SSW 7.5.3 rev 2
Macintosh Common Lisp	3.0	YES	APDA Product
Macintosh Easy Open	1.1.2	YES	Ships with SSW 7.5.3 rev 2
Macintosh Quadra Extra	1.0	NO	Unnecessary with SSW 7.5.3 rev 2
Macintosh Visca Driver	1.2	YES	ADPA Product
MacODA	1.0	YES	
MacOSI	1.1	YES	
MacsBug	6.5.2	YES	Posted online
MacSNMP Admin	1.0.2	YES	
MacSNMP Client	1.0.2	YES	
MacTCP	2.0.6	YES	Ships with SSW 7.5.3 rev 2
MacTCP Admin	2.0.4	YES	
MacTCP Developer's Kit	N/A	YES	APDA Product
MacTCP Token Ring Ext.	2.0.4	YES	Ships with SSW 7.5.3 rev 2
MacTerminal	3.0	YES	
MacX	1.5	YES	
MacX.400	1.1	YES	
MacX25	1.3	YES	
MIDI Manager Extension	2.0.2	YES	APDA Developer's tool, posted online
Monitors & Sound	1.1	YES	Ships with SSW 7.5.3 rev 2
MountImage	1.2	NO	NOT APPLE SOFTWARE use at own risk
Mouse Basics	4.5	NO	Replaced by Macintosh Tutorial
MoviePlayer	2.1	YES	Update available online
MPW	3.3	YES	APDA Product
MPW 411	N/A	YES	APDA Product
MPW C++	3.2	YES	APDA Product
NetTrax	1.2	NO	No longer offered by APDA
Network Control Panel	3.0.3	YES	Part of System 7.5.3 rev 2
Network Launch Fix	1.0.2	NO	Unnecessary with SSW 7.5.3 rev 2
Network Software	1.5.1	NO	Obsolete-changes included Installer in SSW 7.5.3 rev 2
Network Software Selector	1.0	YES	Ships with SSW 7.5.3 rev 2
Newton Connection (Mac)	2.0.2	YES	For Macintosh
Newton Connection (Win)	2.0.3	N/A	For Windows, update online
Newton Toolkit	1.5.2b2	YES	Update online
Open Transport	1.1	YES	Ships with SSW 7.5.3 rev 2
Ofoto	2.0.1	YES	Color OneScanner Support
OfotoColor	1.0	YES	System Extension
Open Doc	1.1	YES	
PANTONE Files for Color LW	12/600	YES	Posted Online
PatchBay DA	2.0.1	NO	APDA Developer's tool, posted

			online
PC Exchange	2.0.5	YES	Ships with SSW 7.5.3 rev 2
PC Exchange	2.0.7	YES	Ships with DOS Compatibility 1.5 SW. It is only compatible with Mac OS computers supporting DOS and PC Comptibility Cards.
PC Net Exchange	1.0.1	YES	Ships with SSW 7.5.3 rev 2
PC Setup	1.5	YES	Ships with SSW 7.5.3 rev 2, NOT for Quadra 610 DOS Compatible
PDD Maker GX	1.1.1	YES	Ships with SSW 7.5.3 rev 2
Personal LaserWriter 300	1.2	NO	Use LaserWriter 300 driver
Personal LaserWrtr 320	1.0.1	NO	Use LaserWriter 8 driver
Personal LaserWriter NTR	2.0	NO	Use LaserWriter 8 driver
Personal LaserWriter SC	7.0.1	YES	Ships with SSW 7.5
PhotoFlash	2.0.1	YES	Fixes Enhance problem on PCI-based Macs
PlainTalk	1.4.1	YES	Bundled with Power Surge Power Macs in USA, available online.
Portable StyleWriter	1.0.1	YES	See TIL article on GX drivers
PowerBook Control Panel	7.5.3	YES	Ships with SSW 7.5.3 rev 2
PowerBook/DOS Companion		YES	See separate TIL article
PowerBook Display	7.5.2	YES	Ships with SSW 7.5.3 rev 2
PowerBook File Assistant	1.0	YES	
PowerBook Setup Ctl Pnl	7.3.1	YES	Ships with SSW 7.5.3 rev 2
PowerCD Setup	1.0.1	YES	
PowerShare	1.1	YES	Collaboration Server
PowerTalk	1.2.3	YES	Ships with SSW 7.5.3 rev 2
PowerTalk for PowerPC	1.0.2	NO	Use PowerTalk 1.1
Printer Share	1.1.3	YES	Ships with SSW 7.5.3 rev 2
Quadra 950 Color Addition	1.0	NO	Unnecessary with SSW 7.5.3 rev 2
QuickDraw GX	1.1.3	YES	Ships with SSW 7.5.3 rev 2
QuickTake (Mac)	2.0.2	YES	For Macintosh
QuickTake (Win)	1.5	N/A	For Windows
QuickTime	2.5	YES	
QuickTime (Win)	2.0.3	N/A	For Windows
QuickTime Conferencing	1.0.2	YES	Shipped on PowerMac 7500/8500
QuickTime Starter Kit	1.6.1	NO	Discontinued product
Rename Rescue	1.0	NO	Unnecessary with SSW after 7.0.1
ResEdit	2.1.3	YES	APDA Product
Responder	1.1.1	NO	Not required, built into System 7.x
SADE	1.3.2	NO	No longer offered by APDA
Scanner	3.0	YES	Color OneScanner Support
Screen	1.0.7	YES	Ships with SSW 7.5.3 rev 2
Script Editor	1.1.1	YES	Ships with SSW 7.5.3 rev 2
Scriptable Text Editor	1.1	YES	AppleScript Developer's Kit
SerialDMA	2.0.2	NO	Obsolete-changes included in SSW 7.5.3 rev 2
Serial Switch	1.2	YES	Ships with SSW 7.5.3 rev 2
Serial Tool	1.0.2	YES	Basic Connectivity Set 1.1.1
SimpleText	1.3.1	YES	Ships with SSW 7.5.3 rev 2, also supports QuickDraw 3D
SNA*ps APPC Developer's	N/A	N/A	APDA Kit

SNA*ps	N/A	N/A	Contact Wall Data, Inc.
Sound Control Panel	8.0.5	YES	Ships with SSW 7.5.3 rev 2
Sound Effects	1.0	YES	
Sound Manager	3.1	NO	Obsolete-changes included in SSW 7.5.3 rev 2
Speech Manager	1.4	YES	Ships with SSW 7.5.3 rev 2
StyleWriter 1200	2.1.1	YES	Ships with 7.5.3 rev 2
StyleWriter GX	1.1.1	YES	Installed by Quickdraw GX 1.1.2, replaced 1.0.1
StyleWriter II	1.2	YES	Ships with SSW 7.5
System Enablers* - Please see separate			Tech Info Library article: "System Enablers: Current Versions"
System Picker	1.0	NO	NOT APPLE SOFTWARE use at own risk
System Update	3.0	NO	Update for System 7.1.x
System 7.5 Update	2.0.4	YES	Update for System 7.5.3 rev 2
System 7.5.2	1.1	YES	Specific to System 7.5.2, online Printing Fix
TeachText	7.2	NO	Use SimpleText, which ships with 7.5.3 rev 2
Telephone Manager	1.1.1	YES	
Thread Manager	2.0.1	YES	Comes with PowerTalk/System 7.5
Token Ring Control Pnl	1.0.1	YES	Ships with SSW 7.5.3 rev 2
Token Ring	1.0.2	YES	Ships with SSW 7.5.3 rev 2, for the Token Ring 4/16 NB and Token Ring NB/c cards
Token Ring	2.5.2	YES	Ships with SSW 7.5.3 rev 2, for TokenTalk NB card
TokenTalk	2.5.7	YES	Ships with SSW 7.5.3 rev 2
TV Setup Cntl Panel	1.0.2	YES	System Update Disk v 3.0
Type III Battery (Ext.)	1.0	NO	To use Type III batteries on PB Duos (other than 280) running pre-System 7.5
Video (control panel)	1.0.2	NO	Cntl pnl for AudioVision 14 Monitor
Video Monitor	1.0.1	YES	Bundled with AVs and Power Macs
VideoSync	1.0	NO	No longer offered by APDA
Virtual Monitor Switch	1.0	NO	Unnecessary with SSW 7.5.3 rev 2
Virtual User	2.0.1	YES	APDA Product
WorldScript II	7.5.1	YES	
Xmodem Tool	1.1	YES	Ships with SSW 7.5.3 rev 2

End_Table

* System Enablers provide machine specific support for new Macintosh Computers introduced beginning in October 1992. System 7.5 eliminates the need for a machine specific enabler, on systems shipping prior to October 1994.

** All of these Express Modem files are part of the Apple Telecom 2.3.2 software package.

This article provides some information about non-Apple software products. Please contact the appropriate vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

These articles can help you locate the software updates mentioned here:

• "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.

• "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:
09 Oct 1996 - Updated PC Exchange version information.
04 Oct 1996 - Added AppleTalk ImageWriter LQ 7.0.1.
11 Sep 1996 - Updated CD-ROM Setup 5.1.7, Cyberdog 1.1 and Open Doc 1.1.
30 Aug 1996 - Review and update, several changes.

Apple Software: Current Versions (11/96)

==========

Article Created: 7 December 1992
Article Reviewed/Updated: 26 November 1996

TOPIC ----------

The table below lists versions of SHIPPING Apple software products and provides the following information for each:

Version

The current version number.

7.5.3 rev 2?

Whether the product is supported with System Software 7.5.3 rev 2 (SSW 7.5.3 rev 2).

Some products, are listed as unsupported, but may be fully compatible. For example, TeachText is listed as not supported with System 7.5, because it has been replaced by SimpleText. This does not necessarily mean that TeachText does not work with System 7.5.3 rev 2.

Notes

Additional information on the product

Additional articles in the Tech Info Library describe many of the products listed below more fully. This article does not cover any announced Apple products which are not currently shipping.

DISCUSSION ----------

Begin_Table

Product	Version	7.5.3 rev 2	Notes

32-Bit System Enabler	1.0.3	NO	For Mac II, IIx, IIcx, SE/30; Use MODE32 version 7.5
8*24 GC (Extension)	7.0.1	NO	Not Compatible with PowerMac
950 Color Addition	1.0	NO	Unnecessary with SSW 7.5
A/UX	3.0.1	NO	
A/UX	3.1	NO	Only supports the AWS 95.
A/ROSE	1.2.2	YES	Ships with SSW 7.5.3 rev 2
ADSP	1.5.1	NO	Not required, part of SSW 7.0 & higher
Apple IIe Card SW	2.2.1d1	YES	
Apple Backup	1.4	YES	Ships with SSW 7.5
Apple Built-In Ethernet	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Apple Color Printer	1.0	YES	See TIL article on GX drivers
Apple Ethernet CS	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Apple Ethernet LC	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Apple Ethernet NB	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Apple DocViewer	1.1.1	YES	Apple Extras folder of Power Macs
Apple Event Manager	1.0.3	NO	Not necessary w/ SSW 7.5.3 rev 2
Apple File Exchange	7.0	NO	Use PC Exchange, which ships w/SSW 7.5.3 rev 2
Apple Font Pack	1.0	YES	See separate article in Tech Info Library for contents of Font Pack
Apple HD SC Setup	7.3.5	YES	Ships with SSW 7.5.3 rev 2
Apple Guide	2.0.2	YES	Ships with SSW 7.5.3 rev 2
Apple Internet Router	3.0.1	YES	Install before NSI 1.4.5
Apple LAN Utility	1.0b4	YES	Posted online-non supported software area
AppleLink	6.1	YES	Contact Apple Online Services
Apple Media Tool	2.0	YES	
Apple Menu Options	1.1.2	YES	Ships with SSW 7.5.3 rev 2
Apple MIDI Manager	2.0.2	YES	APDA Developer's tool, posted online
Apple MIDI Driver	2.0.2	YES	APDA Developer's tool, posted online
Apple Modem Tool	1.5.5	YES	
Apple Personal Diagnostics	1.1.3	YES	Updater from 1.1 online
Apple Phone	1.0.1	NO	Application bundled with AV models
Apple Photo Access	2.1	YES	Ships with SSW 7.5.3 rev 2
Apple Printer Utility	2.0	YES	Part of LaserWriter 8.3, posted online
Apple Remote Access	2.1	YES	Separate Client, Personal Server & Multiport Server versions.
AppleScript	1.1	YES	Ships with SSW 7.5.3 rev 2
AppleSearch Client	1.5	YES	
AppleSearch Client (Win)	1.0	N/A	For Windows
AppleSearch Server	1.5.1	YES	
AppleShare Client (Win)	1.0.2	N/A	For Windows
AppleShare File Server	4.2.1	YES	4.0.2 or later required w/ SSW 7.5
AppleShare Print Server	4.2.1	YES	This version required w/ SSW 7.5

Apple Shared Lib. Mgr.	1.1.2	YES	
AppleTalk (driver)	v.60.1	YES	Ships with SSW 7.5.3 rev 2(If using Open Transport 1.1; Classic AppleTalk version remains 58.1.5)
AppleTalk ImageWriter	7.0.1	YES	Ships with SSW 7.5
AplTalk ImageWriter LQ	7.0.1	YES	Ships with SSW 7.5
Apple Telecom	2.3.3	YES	Ships with SSW 7.5.3 rev 2
Apple Video Player	1.4	YES	For Performa 6xx TV/Tuner Card
AppleVision Display SW	1.0.4	YES	Supports AppleVision & AudioVision Displays on System 7.5.x computers
Assistant Toolbox	1.3	YES	Ships with SSW 7.5.3 rev 2
At Ease (Basic)	3.0.3	YES	Available from Claris
At Ease for Workgroups	3.0.3	YES	Available from Claris
At Ease	4.0	YES	Part of Apple Network Administrator Toolkit
Audio Volume	1.1	YES	Available online
AudioVision (extension)	1.0.2	NO	Extension for AudioVision 14 Display
Auto Power On/Off	1.0	YES	Ships with SSW 7.5.3 rev 2
AutoRemounter	1.2	YES	Ships with SSW 7.5.3 rev 2
AV Serial Extension	1.0	NO	Unnecessary with SSW 7.5.3 rev 2
AW Server 95	1.1	NO	Part of AWS 95 Update 1.1
AWS 95 Tune-Up	1.0	NO	System update disks (2) for the Apple Workgroup Server 95
Basic Color Monitor	1.0	NO	Unnecessary with SSW 7.5.3 rev 2
Basic Connectivity Set	1.1.1	YES	
Battery DA	7.1.1	NO	Part of control strip in SSW 7.5.3 rev 2
Battery Recondition	1.3	YES	Ships with SSW 7.5.3 rev 2
CD-ROM Setup	5.1.7	YES	Posted online
Chinese Language Kit	1.1.1	YES	See separate TIL article, Chinese Language Kit: Frequently Asked Questions
Chooser	7.5.4	YES	Ships with SSW 7.5.3 rev 2
CloseView	7.2.1	YES	Ships with SSW 7.5.3 rev 2
Color Picker	2.0.1	YES	Ships with SSW 7.5.3 rev 2
Color SW 2400	2.1.1	YES	Ships with SSW 7.5.3 rev 2
Color SW 2400 GX	1.0.1	YES	Installed by Quickdraw GX 1.1.2
Color SW Pro	1.5.2	YES	Ships with SSW 7.5.3 rev 2
ColorSync	2.0.1	YES	Ships with SSW 7.5.3 rev 2
Control Strip	1.3.1	YES	Ships with SSW 7.5.3 rev 2
CPU Energy Saver	1.0.6	YES	Ships with SSW 7.5.3 rev 2
Curare	1.0	NO	No longer offered by APDA
Cyberdog	1.1	YES	
DAL Software	N/A	N/A	Not Apple software, contact ITI
DART	1.5.3	NO	Not Apple software
Desktop Printer Ext.	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Desktop PrintMonitor	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Desktop Printer Spooler	1.0.3	YES	Ships with SSW 7.5.3 rev 2
Disk Copy	4.2	YES	Ships with SSW 7.5.3 rev 2
Disk First Aid	7.2.2	YES	Ships with SSW 7.5.3 rev 2
Display Enabler	2.0	NO	Obsolete-changes included

			in SSW 7.5.3 rev 2
DocViewer	1.1.1	YES	
DOS Compatibility SW	1.5	YES	Available online.
Drive Firmware Update	1.2	YES	Available online.
Drive Setup	1.0.5	YES	Available online.
Duo Battery Patch	1.0	NO	Unnecessary with SSW 7.5.3 rev 2
Easy Access Ctrl Panel	7.2	YES	Ships with SSW 7.5
Energy Saver	1.1	YES	Ships with SSW 7.5.3 rev 2
EtherTalk	2.5.7	YES	Ships with SSW 7.5.3 rev 2
Express Modem**	2.3.3	YES	Control panel for Express Modem and GeoPort
Express Modem Tool**	2.3.3	YES	CTB Extension for Express Modem, GeoPort
Express Modem ARA 1.x**	2.3	YES	AppleTalk Remote Access CCL file
Express Modem ARA 2.x**	2.3	YES	AppleTalk Remote Access CCL file
Express Modem CCL**	2.3	YES	AppleLink CCL file
Extension Manager	3.0.3	YES	Ships with Display SW 1.2
Fax Extension**	2.3.3	YES	PB Modem, Express Modem, GeoPort
Fax Sender**	2.1	YES	PB Modem, Express Modem, GeoPort
Fax Sender GX**	2.3	YES	PB Modem, Express Modem, GeoPort
Fax Terminal**	2.3.3	YES	PB Modem, Express Modem, GeoPort
Fax Viewer**	2.3.3	YES	PB Modem, Express Modem, GeoPort
Fax Cover**	2.3.3	YES	PB Modem, Express Modem, GeoPort
Font/DA Mover	4.1	NO	Unnecessary with SSW 7.5.3 rev 2
GeoPort Extension	2.3.3	YES	See Apple Telecom 2.3 above
GeoPort for Power Mac	2.3.3	YES	See Apple Telecom 2.3 above
Hardware System Update	2.0.1	NO	Obsolete-changes included in SSW 7.5.3 rev 2
HyperCard	2.3	YES	APDA Product, avail from resellers; 2.3.5 Update available online
HyperCard Player	2.3.5	YES	Ships with Display SW 1.2
HyperScan	2.0.1	YES	OneScanner
ImageWriter	7.0.1	YES	Ships with Display SW 1.2
ImageWriter GX	1.1.1	YES	Installed by Quickdraw GX 1.1.2, replaced 1.0.1
ImageWriter LQ GX	1.1.1	YES	Installed by Quickdraw GX 1.1.2, replaced 1.0.1
Installer	4.0.3	YES	Ships with SSW 7.5
Inter*Poll	1.0.1	NO	Not supported w/ SSW 7.5.3 rev 2
Internal HD Format	1.3	YES	For use with IDE Drives Only, posted online
Japanese Language Kit	1.2	YES	From Apple Order Center
LaserWriter	7.2	YES	Ships with SSW 7.5
LaserWriter 8	8.3.4	YES	Ships with SSW 7.5.3 rev 2
LaserWriter Bridge	2.1	YES	Update available online.
LaserWriter GX	1.1.2	YES	Installed by Quickdraw GX 1.1.2, replaced 1.0.1
LaserWriter IISC GX	1.1.1	YES	Installed by Quickdraw GX 1.1.2, replaced 1.0.1
LaserWriter Utility	7.7	YES	Ships with SSW 7.5
LaserWriter Select 300	1.2	NO	Use LaserWriter 300 driver
LaserWriter 300	1.2	YES	Ships with SSW 7.5

LaserWriter 300 GX	1.1.1	YES	Installed by Quickdraw GX 1.1.2, replaced 1.0.1
LaserWriter Select 360	1.1	NO	Use LaserWriter 8.3.3 driver
LaserWrtr Select 360 Fax	1.1	NO	Use LaserWriter 8.2.3f driver
Likewise	1.0.1	NO	Discontinued 12/93
LocalTalk Bridge	2.1	YES	Update available online.
LW Select 310	7.0.1	YES	Ships with SSW 7.5
MacApp	3.0.1	YES	APDA Product
MacCheck	1.0.5	NO	Discontinued
MacinTalk Pro	1.4	YES	Ships with Text-to-Speech software 1.4.1
Macintosh Basics	5.0	NO	Mac Tutorial is included in SSW 7.5.3 rev 2
Macintosh Common Lisp	3.0	YES	APDA Product
Macintosh Easy Open	1.1.2	YES	Ships with SSW 7.5.3 rev 2
Macintosh Quadra Extra	1.0	NO	Unnecessary with SSW 7.5.3 rev 2
Macintosh Visca Driver	1.2	YES	ADPA Product
MacODA	1.0	YES	
MacOSI	1.1	YES	
MacsBug	6.5.2	YES	Posted online
MacSNMP Admin	1.0.2	YES	
MacSNMP Client	1.0.2	YES	
MacTCP	2.0.6	YES	Ships with SSW 7.5.3 rev 2
MacTCP Admin	2.0.4	YES	
MacTCP Developer's Kit	N/A	YES	APDA Product
MacTCP Token Ring Ext.	2.0.4	YES	Ships with SSW 7.5.3 rev 2
MacTerminal	3.0	YES	
MacX	1.5	YES	
MacX.400	1.1	YES	
MacX25	1.3	YES	
MIDI Manager Extension	2.0.2	YES	APDA Developer's tool, posted online
Monitors & Sound	1.1	YES	Ships with SSW 7.5.3 rev 2
MountImage	1.2	NO	NOT APPLE SOFTWARE use at own risk
Mouse Basics	4.5	NO	Replaced by Macintosh Tutorial
MoviePlayer	2.1	YES	Update available online
MPW	3.3	YES	APDA Product
MPW 411	N/A	YES	APDA Product
MPW C++	3.2	YES	APDA Product
NetTrax	1.2	NO	No longer offered by APDA
Network Assistant	2.0	YES	Part of Apple Network Administrator Toolkit
Network Control Panel	3.0.3	YES	Part of System 7.5.3 rev 2
Network Launch Fix	1.0.2	NO	Unnecessary with SSW 7.5.3 rev 2
Network Software	1.5.1	NO	Obsolete-changes included Installer in SSW 7.5.3 rev 2
Network Software Selector	1.0	YES	Ships with SSW 7.5.3 rev 2
Newton Connection (Mac)	2.0.2	YES	For Macintosh
Newton Connection (Win)	2.0.3	N/A	For Windows, update online
Newton Toolkit	1.6.2	YES	
Open Transport	1.1	YES	Ships with SSW 7.5.3 rev 2
Ofoto	2.0.1	YES	Color OneScanner Support

OfotoColor	1.0	YES	System Extension
Open Doc	1.1	YES	
PANTONE Files for Color	LW 12/600	YES	Posted Online
PatchBay DA	2.0.1	NO	APDA Developer's tool, posted online
PC Exchange	2.0.5	YES	Ships with SSW 7.5.3 rev 2
PC Exchange	2.0.7	YES	Ships with DOS Compatibility 1.5 SW. It is only compatible with Mac OS computers supporting DOS and PC Comptibility Cards.
PC Net Exchange	1.0.1	YES	Ships with SSW 7.5.3 rev 2
PC Setup	1.5	YES	Ships with SSW 7.5.3 rev 2, NOT for Quadra 610 DOS Compatible
PDD Maker GX	1.1.1	YES	Ships with SSW 7.5.3 rev 2
Personal LaserWriter 300	1.2	NO	Use LaserWriter 300 driver
Personal LaserWrtr 320	1.0.1	NO	Use LaserWriter 8 driver
Personal LaserWriter NTR	2.0	NO	Use LaserWriter 8 driver
Personal LaserWriter SC	7.0.1	YES	Ships with SSW 7.5
PhotoFlash	2.0.1	YES	Fixes Enhance problem on PCI-based Macs
PlainTalk	1.4.1	YES	Bundled with Power Surge Power Macs in USA, available online.
Portable StyleWriter	1.0.1	YES	See TIL article on GX drivers
PowerBook Control Panel	7.5.3	YES	Ships with SSW 7.5.3 rev 2
PowerBook/DOS Companion		YES	See separate TIL article
PowerBook Display	7.5.2	YES	Ships with SSW 7.5.3 rev 2
PowerBook File Assistant	1.0	YES	
PowerBook Setup Ctl Pnl	7.3.1	YES	Ships with SSW 7.5.3 rev 2
PowerCD Setup	1.0.1	YES	
PowerShare	1.1	YES	Collaboration Server
PowerTalk	1.2.3	YES	Ships with SSW 7.5.3 rev 2
PowerTalk for PowerPC	1.0.2	NO	Use PowerTalk 1.1
Printer Share	1.1.3	YES	Ships with SSW 7.5.3 rev 2
Quadra 950 Color Addition	1.0	NO	Unnecessary with SSW 7.5.3 rev 2
QuickDraw GX	1.1.3	YES	Ships with SSW 7.5.3 rev 2
QuickTake (Mac)	2.0.2	YES	For Macintosh
QuickTake (Win)	1.5	N/A	For Windows
QuickTime	2.5	YES	
QuickTime (Win)	2.0.3	N/A	For Windows
QuickTime Conferencing	1.0.2	YES	Shipped on PowerMac 7500/8500
QuickTime Starter Kit	1.6.1	NO	Discontinued product
Rename Rescue	1.0	NO	Unnecessary with SSW after 7.0.1
ResEdit	2.1.3	YES	APDA Product
Responder	1.1.1	NO	Not required, built into System 7.x
SADE	1.3.2	NO	No longer offered by APDA
Scanner	3.0	YES	Color OneScanner Support
Screen	1.0.7	YES	Ships with SSW 7.5.3 rev 2
Script Editor	1.1.1	YES	Ships with SSW 7.5.3 rev 2
Scriptable Text Editor	1.1	YES	AppleScript Developer's Kit
SerialDMA	2.0.2	NO	Obsolete-changes included in SSW 7.5.3 rev 2
Serial Switch	1.2	YES	Ships with SSW 7.5.3 rev 2

Serial Tool	1.0.2	YES	Basic Connectivity Set 1.1.1
SimpleText	1.3.1	YES	Ships with SSW 7.5.3 rev 2, also supports QuickDraw 3D
SNA*ps APPC Developer's	N/A	N/A	APDA Kit
SNA*ps	N/A	N/A	Contact Wall Data, Inc.
Sound Control Panel	8.0.5	YES	Ships with SSW 7.5.3 rev 2
Sound Effects	1.0	YES	
Sound Manager	3.1	NO	Obsolete-changes included in SSW 7.5.3 rev 2
Speech Manager	1.4	YES	Ships with SSW 7.5.3 rev 2
StyleWriter 1200	2.1.1	YES	Ships with 7.5.3 rev 2
StyleWriter GX	1.1.1	YES	Installed by Quickdraw GX 1.1.2, replaced 1.0.1
StyleWriter II	1.2	YES	Ships with SSW 7.5
System Enablers* - Please see separate			Tech Info Library article: "System Enablers: Current Versions"
System Picker	1.0	NO	NOT APPLE SOFTWARE use at own risk
System Update	3.0	NO	Update for System 7.1.x
System 7.5 Update	2.0.4	YES	Update for System 7.5.3 rev 2
System 7.5.2	1.1	YES	Specific to System 7.5.2, online Printing Fix
TeachText	7.2	NO	Use SimpleText, which ships with 7.5.3 rev 2
Telephone Manager	1.1.1	YES	
Thread Manager	2.0.1	YES	Comes with PowerTalk/System 7.5
Token Ring Control Pnl	1.0.1	YES	Ships with SSW 7.5.3 rev 2
Token Ring	1.0.2	YES	Ships with SSW 7.5.3 rev 2, for the Token Ring 4/16 NB and Token Ring NB/c cards
Token Ring	2.5.2	YES	Ships with SSW 7.5.3 rev 2, for TokenTalk NB card
TokenTalk	2.5.7	YES	Ships with SSW 7.5.3 rev 2
TV Setup Cntl Panel	1.0.2	YES	System Update Disk v 3.0
Type III Battery (Ext.)	1.0	NO	To use Type III batteries on PB Duos (other than 280) running pre-System 7.5
User & Group Manager	1.0	YES	Part of Apple Network Administrator Toolkit
Video (control panel)	1.0.2	NO	Cntl pnl for AudioVision 14 Monitor
Video Monitor	1.0.1	YES	Bundled with AVs and Power Macs
VideoSync	1.0	NO	No longer offered by APDA
Virtual Monitor Switch	1.0	NO	Unnecessary with SSW 7.5.3 rev 2
Virtual User	2.0.1	YES	APDA Product
WorldScript II	7.5.1	YES	
Xmodem Tool	1.1	YES	Ships with SSW 7.5.3 rev 2

End_Table

* System Enablers provide machine specific support for new Macintosh Computers introduced beginning in October 1992. System 7.5 eliminates the need for a

machine specific enabler, on systems shipping prior to October 1994.

** All of these Express Modem files are part of the Apple Telecom 2.3.2 software package.

This article provides some information about non-Apple software products. Please contact the appropriate vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

These articles can help you locate the software updates mentioned here:

• "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.

• "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:
26 Nov 1996 - Updated LocalTalk Bridge and LaserWriter Bridge to v2.1.
18 Nov 1996 - Updated Newton Toolkit to 1.6.2.
17 Oct 1996 - Updated At Ease, and added Apple Network Administrator Toolkit.
09 Oct 1996 - Updated PC Exchange version information.
04 Oct 1996 - Added AppleTalk ImageWriter LQ 7.0.1.

Macintosh Quadra: Using with Practical Peripherals 9600SA

Revised: 12/14/92
Security: Everyone

Macintosh Quadra: Using with Practical Peripherals 9600SA

==========

Article Created: 7 December 1992

TOPIC ----------

I'm having problems getting AppleTalk Remote Access (ARA) to answer calls. I'm using a Macintosh Quadra 700 and a Practical Peripherals 9600SA modem. The modem works fine with a Macintosh PowerBook 100, Macintosh Classic, Macintosh IIci, Macintosh Plus, and Macintosh SE.

When calling the Quadra, the modem answers for several seconds, then an error message appears: "The connection has failed. An unknown error of type -5,920 has occurred."

DISCUSSION ----------

The problem you are experiencing is actually due to the command handling speed of the modem. It can be fixed with a new script. Macintosh Quadra systems issue CCL instructions too quickly for the Practical Peripherals 9600SA to respond. (Other modems may have this problem as well.)

The solution is to insert a suitable "pause" before each write command in the CCL script. Testing on a Macintosh Quadra 700 with the 'Practical Peripherals 9600SA' script indicates 'pause 1' gives 275ms delay, 'pause 2' gives 375ms, and so on. A 'pause 1' should be sufficient for any modem. One side effect is that the entire dial/connect sequence takes approximately 1 second more.

The 'Practical Peripherals 9600SA' script with the pauses included is available on AppleLink. Use this script on all Macintosh systems.

Here is the path to the script on AppleLink:

Software Sampler
Apple SW Updates

Macintosh
  Networking & Communications
    AppleTalk Remote Access
      Original CCL's
       Practical Peripherals 9600SA (updated)

Note: The ARA error -5,920 means the length of a write request exceeds the maximum allowed.

Apple CD-ROM Extension 4.0.x Versions: Differences (9/93)

Revised: 9/27/93
Security: Everyone

Apple CD-ROM Extension 4.0.x Versions: Differences (9/93)

==========

Article Created: 11 January 1993
Article Reviewed/Updated: 27 September 1993

TOPIC ----------

What are the differences between versions 4.0, 4.0.1, 4.0.2, and 4.0.4 of the Apple CD-ROM extension?

DISCUSSION ----------

Beginning with version 4.0 of CD-ROM Setup, the installer script installed QuickTime. If the version of QuickTime changed, the installer script for CD-ROM Setup changed to request the latest version of QuickTime.

Version 4.0

Version 4.0 of the Apple CD-ROM extension was the first version to support dual-speed operation (which supports multiple-session Photo CDs) and the AppleCD 300 series. This version had problems with certain CD-ROMs that used encryption technology to restrict access to files. When the customer was given a decryption key to gain access to a file, the file wouldn't always appear in the Finder.

Here's a list of some of the CD-ROMs that had this problem:

- Adobe Type on Call
- AgfaType Collection
- Bitstream's Type Treasury
- Image Club Graphics
- D'Pix
- Nautilus CD
- Picture Shop
- Font Shop

QuickTime 1.5 shipped with this version.

Version 4.0.1

Version 4.0.1 was produced to fix the decryption problem. This version was only tested on the Macintosh IIvx and Performa 600.

Version 4.0.2

Version 4.0.2 was tested on all Macintosh computers. A few changes were made to ensure compatibility across the Macintosh product line, but there's no functional difference between 4.0.1 and 4.0.2 versions of the Apple CD-ROM extension.

Version 4.0.4

This version has AppleCD Speed Switch revised to 1.0.3. The Macintosh CD-ROM Setup 4.0.4 Installer provides the option to install QuickTime 1.6. And it includes TeachText 7.1.

Version 4.0.5

QuickTime 1.6.1 shipped with this version.

Article Change History:
27 September 1993 - Added QuickTime information and version 4.0.5.
28 July 1993 - Added information about version 4.0.4.

MacX1.2: Tuning BackInStore

Revised: 1/15/93
Security: Everyone

MacX1.2: Tuning BackInStore

==========

Article Created: 23 December 1992

TOPIC ----------

We're running MacX 1.2 and wonder what you advise as far as tuning BackInStore.

DISCUSSION ----------

When a server maintains the contents of a window, the pixels saved off screen are what is known as Backing Store. BackInStore is an industry-standard way of handling virtual memory functions from within an X server application. It is a new feature of MacX 1.2.

If the Backing-stores attribute is set for a server, it indicates that the server supports backing stores for this screen, although it may be limited to the number of windows it can support at one time, due to storage limitations. Also, the Backing Store can have different attributes set:

- A Backing Store of WhenMapped advises the server that maintaining contents of obscured regions when the window is mapped would be beneficial.

- A Backing Store of Always advises the server that maintaining contents even when the window is unmapped would be beneficial.

- A Backing Store of NotUseful advises the server that maintaining contents is unnecessary, although a server might still choose to maintain contents, while the window is mapped.

A window is said to be mapped, if a map call has been performed on it. Unmapped Windows and their inferiors are never viewable or visible.

Tuning generally refers to metrics applied to sizing the BackInStore file

and is dependent on how memory is used by the MacX application, as in caching of information and swapping out the memory used for displaying idle or non-active processes.

In the case of the MacX server, the only tuning you can do is to allocate enough memory for the MacX application. Because the use of Backing Store increases the amount of memory used by MacX, you could save some memory going to the "Display Preferences" dialog and selecting the option for "Requesting Clients" instead of "All Clients". If the "Requesting Clients" button is selected, MacX provides Backing Store only to the clients that explicitly request it.

For the best performance of MacX, make sure that the screen depth of the Macintosh is set to either 1 or 8 bits. If you choose any of the other screen depths, then MacX slows significantly.

AppleTalk Remote Access and Tymnet (2/96)

Revised: 2/9/96
Security: Everyone

AppleTalk Remote Access and Tymnet (2/96)

==========

Article Created: 7 December 1992
Article Reviewed/Updated: 9 February 1996

TOPIC ----------

Can I use AppleTalk Remote Access (ARA) to connect to an ARA system via Tymnet? I can dial up a Tymnet modem, input a terminal type (a character "A" or "O"), input my network username and password, and then Tymnet connects me (via hard- wired connection) to a Macintosh running ARA. Is this possible with ARA?

DISCUSSION ----------

You can use the Apple Remote Access Multiport Server X.25 Extension to use ARA over an X.25 network such as Tymnet or Sprint.

See the TIL article "ARA and X.25: MultiPort Server X.25 - Description" for more information.

Article Change History:
09 Feb 1996 - Updated with X.25 Extension information.
06 Jan 1993 - To show additional information received.

Apple Equipment: How to Use Apple's Global Warranty (11/94)

Revised: 11/30/94
Security: Everyone

Apple Equipment: How to Use Apple's Global Warranty (11/94)

==========

Article Created: 8 December 1992
Article Reviewed/Updated: 30 November 1994

TOPIC ----------

Apple hardware now includes global warranty coverage for a period of one year. If you discover a defect with your in-warranty Apple product while outside the United States, that product will be covered.

This article, derived from Apple's Limited Warranty card (030-3926-A), tells how to take advantage of this warranty.

DISCUSSION ----------

If your product fails during the warranty period while you are outside of the United States, or in U.S. territories and possessions, you may have it repaired at no charge to you (no refunds or replacements are provided).

You must deliver it during the warranty period, at your expense, to an Apple authorized reseller or service provider in the country in which the product failed. Please be aware that service providers outside the United States may not carry all repair parts for U.S. products, or may not be able to repair some models. If repair parts need to be special ordered, the repair may take longer than normal. If your model cannot be repaired in the country you are in, it may need to be sent to a different country or returned to the U.S. at your expense for service.

If you plan to travel overseas, please remember to take proof of purchase with you. In case your Apple product does fail, you'll have proof of when your product was purchased. If you have questions about this global warranty reimbursement program, please contact your local authorized Apple reseller or Apple representative.

DAL: No Support for Binary Large OBjects

Revised: 12/14/92
Security: Everyone

DAL: No Support for Binary Large OBjects

==========

Article Created: 1 December 1992

TOPIC ----------

A Library is using a system based on an Imaging system to store data in a relational database. The data stored could be anything from text to large binary images. Are Binary Large OBjects (BLOB) supported with the current release of DAL?

Will BLOB be supported in the version of DAM with the ODBC extensions?

DISCUSSION ----------

The data type Binary Large OBjects (BLOB) is not supported by DAL at present.

In reference to BLOB being supported in DAM with ODBC, please understand that ODBC is an API, and the DAL client and server will need to support this data type also in order for it to work. Certainly the drive to support ODBC will facilitate this upgrade to DAM or DAL development.

Performa 600: Explanation of Included Disks

Revised: 12/9/92
Security: Everyone

Performa 600: Explanation of Included Disks

==========

Article Created: 4 December 1992

TOPIC ----------

Do any floppy disks come with the Performa 600? (I heard that Apple doesn't supply any System disks with this computer.)

DISCUSSION ----------

Because System software is installed on the hard drive, no System disks are included in the box. You can purchase the System 7 disk set separately if you wish.

The Performa 600 does come with a Performa Utilities disk, which contains a backup and restore program to restore your system software in the event of a system crash or corruption.

Among the first things you should do when you get your system:

1) Purchase some blank high-density disks.

2) Use the backup software to back up your Performa 600's hard disk to floppies. This way, you will be able to restore your System software if you have a crash.

Performa 600, Macintosh IIvx, IIvi: IIci Cache Cards

Revised: 12/11/92
Security: Everyone

Performa 600, Macintosh IIvx, IIvi: IIci Cache Cards

==========

Article Created: 7 December 1992

TOPIC ----------

Is there a list of Macintosh IIci cache cards that are compatible with the accelerator slot on the Performa 600? Specifically, will Apple's IIci Cache Card work?

DISCUSSION ----------

Apple's IIci Cache Card is not compatible with the Performa 600, the Macintosh IIvx or the Macintosh IIvi (not sold in U.S.).

Apple has not done extensive testing with cache cards, but some cards designed for the Macintosh IIci do work. We recommend you contact the vendor of the cache card.

Performa 600, Macintosh IIvx: SCSI ID and Termination

Revised: 12/11/92
Security: Everyone

Performa 600, Macintosh IIvx: SCSI ID and Termination

==========

Article Created: 09 December 1992

TOPIC ----------

I have a Performa 600 with the internal AppleCD 300i and an external LaserWriter SC.

1) What is the SCSI ID setting for the internal AppleCD 300i?

2) How is the internal AppleCD 300i terminated (it already has two internal SCSI devices)?

3) What is the termination procedure for external devices? With a terminator on the LaserWriter SC, the system would not start. Without the terminator, the system worked. Does this mean that external devices are not the last SCSI devices on the chain?

DISCUSSION ----------

1) The SCSI ID of the internal AppleCD 300i in the Performa 600 and the Macintosh IIvx is "3".

2) The Performa 600 and the Macintosh IIvx provide on-board SCSI termination when no external SCSI device is connected to the DB-25 connector. Once an external SCSI device is plugged into the SCSI port, you need to add a SCSI Terminator on the last device in the external SCSI chain

   SCSI ID has nothing to do with termination or where the device is in the SCSI chain. You can have the SCSI ID set to 1 and have it be the last device on the chain -- and it will work.

3) We have seen occasional problems like this when connecting SCSI devices on the SCSI bus. SCSI termination seems at times more art than science. The basic answer is: If it works, then it's OK to leave it that way. If more

devices are added to chain, then you will more than likely need to add a terminator.

Other workarounds are:

- Start up the Macintosh before powering up any SCSI devices.
- Double-terminate the SCSI bus, using platinum terminators. CAUTION: Do not use two black (Macintosh IIfx) terminators, as this may damage the SCSI device or logic board.

Macintosh: What Causes Total Memory Fluctuations

Revised: 12/11/92
Security: Everyone

Macintosh: What Causes Total Memory Fluctuations

==========

Article Created: 10 December 1992

TOPIC ----------

Why does the total memory amount change back and forth every few seconds?

DISCUSSION ----------

Total memory bounces back and forth because the Process Manager makes synthetic fonts purgeable every time it does a context switch. The Font Manager creates synthetic fonts to render fonts to a bit depth that doesn't match the bit depth of the font.

After this, if the synthetic font gets purged, some memory becomes free. Then the Finder updates the total memory used. But redrawing that number forces the Font Manager to rebuild the synthetic font, which takes up more memory. So the Finder updates again, then the Process Manager makes the font purgeable. This repeating process results in Finder updates for the total memory used each time a synthetic font is created or purged.

Macintosh: Fonts and System File Memory Allocation

Revised: 12/11/92
Security: Everyone

Macintosh: Fonts and System File Memory Allocation

==========

Article Created: 10 December 1992

TOPIC ----------

Why doesn't deleting 600K of fonts make my system file allocate 600K less memory? When I look at "About this Macintosh" the system file has allocated only 100K less memory than before deleting the fonts.

DISCUSSION ----------

The system usually loads fonts into memory when an application uses the fonts. So even though you removed 600K of fonts, the fonts you weren't using weren't loaded into memory and have no impact on memory allocated for the system file.

Apple Ethernet NB Card: Expansion RAM Specifications (4/95)

Revised: 4/21/95
Security: Everyone

Apple Ethernet NB Card: Expansion RAM Specifications (4/95)

==========

Article Created: 10 December 1992
Article Reviewed/Updated: 21 April 1995

TOPIC ----------

The Apple Ethernet NB Card, M0417LL/A, has 512KB standard RAM, expandable to 1MB or 2.5MB with third-party memory expansion modules.

To help you be sure to use the correct third-party RAM, this article provides specifications for the RAM.

DISCUSSION ----------

The Apple Ethernet NB card supports 512K of surface-mounted DRAM and four auxiliary "ZIP" sockets for additional 512K or 2MB of DRAM. The standard 512KB of surface-mounted DRAM is organized as four 256K x 4 SOJ packages in the bottom quarter of the 2MB address range ($Fs000000 - $Fs1FFFFF).

A 512K upgrade, implemented with four more 256K x 4 DRAM chips slotted in the ZIP sockets, would be logically located just above the standard 512KB of DRAM. This upgrade would provide a total of 1MB of contiguous RAM in the lower half of the 2MB address range from 000000 to 0FFFFF.

A 2MB upgrade would occupy the entire lower 2MB address range and push the standard 512K up into the bottom quarter of the upper 2MB address range beginning at 200000 and ending at 27FFFF (and copied three times up through 3FFFFF).

The entire memory allocation, regardless of the configuration, is accessible to the 68000 processor, the SONIC Controller, and NuBus. When NuBus is the master, both the 68000 and the SONIC Controller are denied access to RAM. All RAM appears as a 16-bit device to the 68000 and the SONIC. The RAM appears as a full 32-bit wide device, supporting 8-bit, 16-bit, and 32-bit bus reads to the NuBus interface. NuBus accesses to RAM are performed with two 16-bit accesses by the MCP Controller and Data Path circuitry to provide the full 32 bits of

data in one NuBus access. This implementation, transparent to the application, puts the lowest addressed word in the lowest ordered bits (0 -15) and the highest addressed word in the highest ordered bits (16 - 31) of a 32-bit long word. The MMIU (Multi-Master Interface Unit) provides zero wait-state accesses with the 120ns DRAMs, using /CAS before /RAS refreshing.

The DRAM needed for any upgrade to this board must be either 256K x 4 or 1MB x 4 (120ns or faster) AND must be added in increments of 1MB (4-256K ZIP chips) or 2MB (4-1MB ZIP chips) only.

Memory for the card can be difficult to locate. However, if you want to upgrade the RAM, the following information will be helpful:

• Toshiba part No. TC514400AZ (from third-party distributors)

AppleTalk Remote Access Through a Secure ID System

Revised: 12/22/92
Security: Everyone

AppleTalk Remote Access Through a Secure ID System

==========

Article Created: 14 December 1992

TOPIC -----

I am using a "Secure ID" system for anyone trying to connect to the internal network system. This "Secure ID" system uses a "credit card" interface with uniquely assigned user passwords each time someone connects to the network. Currently this is only available for terminal emulation.

I would like to know if there is a way for remote network access with our Macintoshes using ARA through this Secure ID system? Has anyone written a CCL to access this system?

DISCUSSION -----

The only vendor that currently offers Secure ID access via ARA is Cayman Systems. The Cayman System GatorLink, 3 port ARA server offers an optional Secure ID server module which can be used with a Secure ID server. Contact Cayman Systems and Security Dynamics for more information.

Performa 600: Optional Math Co-processor (6/94)

Revised: 6/16/94
Security: Everyone

Performa 600: Optional Math Co-processor (6/94)

==========

Article Created: 15 December 1992
Article Reviewed/Updated: 16 June 1994

TOPIC ----------

Is there an optional FPU (floating-point unit) for the Performa 600 computer?

DISCUSSION ----------

The Performa 600 computer can be upgraded with a math co-processor by merely installing a standard Motorola 68882 chip running at 32 MHz. The hardware and software will automatically recognize the chip. No further hardware or software changes are required.

The math co-processor chip is part number 922-0107 and can be purchased and installed through Apple authorized service providers. This upgrade can be also be used in Macintosh Performa 450, 460, 466, 467, 550, and 560 models.

MS-DOS External 5.25-inch Floppy Drives: Macintosh Compatibility

Revised: 1/21/93
Security: Everyone

MS-DOS External 5.25-inch Floppy Drives: Macintosh Compatibility

==========

Article Created: 15 December 1992

01/21/93 - REVISED
- To include information about Macintosh MS-DOS compatible floppy drives

TOPIC ----------

Are MS/DOS external 5.25-inch floppy drives compatible with Macintosh computers?

DISCUSSION ----------

No, MS-DOS external 5.25-inch floppy drives are not compatible with Macintosh computers. An MS-DOS external 5.25-inch floppy drive is a device that attaches to a MS-DOS computer and reads 5.25-inch diskettes.

Macintosh computers must receive information on mounted disks. A key system call that gathers this information, DiskInPlace, is not supported by MS-DOS floppy drives.

Also, MS-DOS external floppy drives do not have the same pinouts as Macintosh drives.

There are Macintosh-compatible external floppy drives which DO attach to some Macintosh computers and read 5.25-inch MS-DOS diskettes. These floppy drives are designed to connect to Macintosh computers, not to MS-DOS computers. Two examples are:
- the Apple PC 5.25 Floppy Drive, made by Apple Computer
- the DaynaFile, made by Dayna Communications.

LaserWriter IIf and IIg Upgrade Kit: PPD Files Named in Reverse

Revised: 12/22/92
Security: Everyone

LaserWriter IIf and IIg Upgrade Kit: PPD Files Named in Reverse

==========

Article Created: 15 December 1992

TOPIC ----------

Are the PPD files on LaserWriter IIf/IIg ROM Upgrade disk named incorrectly?

DISCUSSION ----------

Yes, the two PPD files on the LaserWriter IIf/IIg ROM Upgrade Disk are named in reverse:

- The PPD file for the LaserWriter IIf is named "APLWIIg2.PPD".
- The PPD file for the LaserWriter IIg is named "APLWIIf2.PPD".

You can rename the files appropriately. There are no other known problems with the PPD files.

System 7 KanjiTalk: Supports JIS x0208 Character Set

Revised: 12/18/92
Security: Everyone

System 7 KanjiTalk: Supports JIS x0208 Character Set

==========

Article Created: 17 December 1992

TOPIC ----------

Which character sets are supported by KanjiTalk System 7: JIS X 0208-1990, JIS X 0212-190, UNICODE/ISO DIS 10646, or something else?

DISCUSSION ----------

Supported Character Set

KanjiTalk supports the JIS x0208 character set. Some of the fonts have extra characters newly created in JIS, but they don't have a number yet.

Unsupported Character Sets

JIS x0212 is the extension to JIS x0208, and it's sometimes referred to as JIS level-3 (Note: JIS x0208 defines JIS level-1 and level-2). This character set isn't supported in KanjiTalk 7.

Unicode and ISO DIS 10646 are actually two different specifications, though 16-bit encoding of ISO 10646 took the Unicode specification. KanjiTalk 7 doesn't support Unicode or ISO 10646.

Novell Network Management From a Remote Macintosh

Revised: 12/22/92
Security: Everyone

Novell Network Management From a Remote Macintosh

==========

Article Created: 16 December 1992

TOPIC -----

What tools are available for a Macintosh to dial in to a Novell server, and then be the network administrator? The administrator needs to be able to configure, update, and in general manage the server remotely, as if standing in front of it.

If the Novell server had the Macintosh Network Loadable Module (NLM), how much administration would be possible from a Macintosh?

DISCUSSION -----

Novell Technical Support provided this excellent input:

We do not really have any recommended method for managing a Novell Network from a remote Macintosh.

From a remote Mac, you can dial into an ARA Server (such as LAN/ROVER) or a Mac with ARA installed on the LAN or dial into a Shiva NetModem to access the LAN. You could then use the Novell NetWare Control Center Utility to administer the network; however, many NetWare administrators who come from a DOS background find this utility difficult to use. And there are some features which are NOT included in the Novell NetWare Control Center Utility which ARE available in the DOS based administrator's utilities: there is no Mac utility equivalent to PCONSOLE, PRINTCON, PRINTDEF, RCONSOLE, SALVAGE. Also, NetWare Control Center lacks the ability to setup WorkGroup Managers, User-Account Managers, and certain user account restrictions.

You may wish to use another option - dial in from a Mac to a PC (either to a Novell Access Server or using Argosy's RUNPC Remote). This will give the Macintosh user a DOS emulation window with a command line prompt [F:>] on

their Macintosh screen, and will allow them to use all of the DOS-based administrators utilities. In order to manage the server remotely "as if they were standing in front of it," the user will need to run the RCONSOLE.EXE utility so this would be the preferred method. Or another option would be to dial from a PC to a PC (once again either to a Novell Access server or to a PC running remote access software like PCAnywhere) and then run the RCONSOLE.EXE utility.

A/UX 3.0 and stropen: out of streams Message

Revised: 1/15/93
Security: Everyone

A/UX 3.0 and "stropen: out of streams" Message

==========

Article Created: 16 December 1992

TOPIC ----------

I have a customer running A/UX 3.0 who is frequently getting "stropen out of streams" messages on his console window. He has not been able to correlate these messages appearing to any particular activity or application program. He has already doubled the NSTREAM and NQUEUE parameters from their defaults, and is still getting these messages.

He's also getting a "fcntl: Local lock-manager not registered" message after booting showing up in the console window.

His hardware configuration is: Quadra 950 with an external Maxtor drive and an external La Cie DAT drive. The monitor is Apple 21" using built-in video. No additional cards. There's a StyleWriter on the printer port, and a Telebit QBlazer on the modem port.

Here is what kconfig -a says:

```
NBUF         =          0
NPBUF        =         20
NFILE        =       1024
NINODE       =       1024
NSPTMAP      =         75
NCALL        =        100
NMOUNT       =         10
NFLOCK       =        200
NREGION      =        300
NPROC        =        100
NCLIST       =        400
MAXUP        =         50
VHNDFRAC     =         16
MAXPMEM      = 0x00000000
NMBUFS       =       1000
```

```
NPTY         =         32
MAXCORE      = 0x00030000
MAXHEADER    = 0x00000800
NSTREAM      =         64
NQUEUE       =        512
NBLK4096     =         30
NBLK2048     =          8
NBLK1024     =         64
NBLK512      =         64
NBLK256      =         64
NBLK128      =         64
NBLK64       =         64
NBLK16       =        128
NBLK4        =        256
SBUFSIZE     =       2048
SLICE        =          5
GETPGSLOW    = 0x00000060
GETPGSHI     = 0x00000080
GETPGSMSK    = 0x00000009
VHANDR       =          2
MAXSC        = 0x00000008
MAXFC        = 0x00000064
MAXUMEM      = 0x00040000
NUMAP        =         10
MINARMEM     = 0x0000000a
MINASMEM     = 0x0000000a
FLCKREC      =        200
FLCKFIL      =         50
CDLIMIT      = 0x01000000
CMASK        = 0x00000000
ROOTDEV      = 0x0000ffff
SWAPDEV      = 0x0000ffff
PIPEDEV      = 0x0000ffff
DUMPDEV      = 0x0000ffff
SWAPLO       =          0
SWAPCNT      =          0
```

DISCUSSION ----------

The "stropen: out of streams" is a fatal error message. It indicates that there is not enough memory to set up and run streams in A/UX.

We suggest that the customer either add more physical RAM to the system, or (not recommend) reduce some kernel memory parameters like NBUF, NFILE, NINODE, NSTREAM, NQUEUE, ... etc. with 'kconfig'.

The "fcntl: Local ..." message is the result from the first message.

On a Quadra 950, 8MB of physical RAM is the minimum for a single user as long as you are not networking. 16MB to 20MB of physical RAM will allow greater functionality and generally provide the memory you need.

MacTerminal: Selecting Folder For Received Files

Revised: 1/15/93
Security: Everyone

MacTerminal: Selecting Folder For Received Files

==========

Article Created: 17 December 1992

TOPIC ----------

I tried to save a received file to the Desktop after receiving a file in MacTerminal 3.0 with Straight Xmodem, Standard.

It didn't put the files there, instead the files are located in MacTerminal folder as:

  File being received… 1
  File being received… 2

DISCUSSION ----------

This is how MacTerminal 3.0 was designed. When you select the Folder For Received Files, if you want to direct incoming files to the folder whose contents is currently displayed, click the Select Current folder button; otherwise, click the folder where you want to direct incoming files and then click the Select button.

You got the results you did because the MacTerminal folder was selected and then you clicked Select; had you clicked on Desktop then on Select Current folder, the files would have been saved to the desktop.

G3 systems	See Tech Info Library article 30250, titled "**Power Macintosh G3 & G3 All-in-one: Video RAM Upgrade**"				

G = Number of Grays
C = Number of Colors

* = HDI-45 port makes use of 640K of internal DRAM memory

(1) For the AV computers pixel and viewable color numbers are for computer graphics only. When video is enabled, VRAM is split evenly between graphics and video.

(2) The Macintosh 12-in. RGB display cannot be used with the Power Macintosh 9500 series. This monitor is incorrectly listed as compatible in the booklet included with each unit titled "Technical Information: Specifications for Power Macintosh 9500 series computers."

PowerBook Family

PowerBook	VRAM	12-in Monochrome	12-in RGB	Basic Color Monitor	Color Plus Display
160,165,165c, 180,180c	--	256 G	256 C	256 C	256 C
500 Series	--	256 G	256 C	256 C	256 C
3400 Series	--	256 G	32,768 C	--	--
G3	--	256 G	16.7M C	N/A	N/A
Duo Dock	512K 1MB	256 G 256 G	256 C 32,768 C	256 C 32,768 C	256 C 32,768 C

Duo Dock II	--	256 G	32,768 C	32,768 C	32,768 C
MiniDock	512K	256 G	256 C	256 C	256 C

G = Number of Grays
C = Number of Colors

3400 Notes:
1) The computer does not provide a display with 2 bits per pixel.

2) An SVGA monitor's display resolution will be 640 by 480 pixels. The user can switch to a higher resolution by using the Monitors control panel or the control strip. The resolution set by the user will be used the next time the computer is started up.

3) If the external monitor can display 800 by 600 pixels at 60 Hz, the PowerBook 3400 computer can display simultaneously on both the external monitor and the flat panel display. This mode of display, called Simulscan, provides the same information on both displays.

Macintosh Video Cards

Video Card	12-in Monochrome	12-in RGB	Basic Color Monitor	Color Plus Display
Macintosh II	256 G	N/A	N/A	16 C

Ext High-Res Card	256 G	N/A	N/A	256 C
4*8 (2)	256 G	N/A	256 C	256 C
8*24	256 G	16.7M C	N/A	16.7M C
8*24GC	256 G	16.7M C	N/A	16.7M C
Display Card 24 AC	256 G	16.7M C	N/A	16.7M C

G = Number of Grays
C = Number of Colors

(1) Can be upgraded with eight (8) Mac II Video Expansion RAM chips for 256 grays/colors.

(2) The 4*8 can be upgraded to a 8*24 by adding two VRAM SIMMs.

DAL: Describe Tables Loses Beginning Characters (8/94)

==========

Article Created: 4 January 1993
Article Reviewed/Updated: 31 August 1994

TOPIC ----------

I have DAL 1.3.5 for VTAM with DB2 2.3. When I do a Describe Tables from the DAL tester, I get the data back with incomplete table names. The characters at the beginning of the table name seem to be cut off. Also, there is a period at the beginning of every row in the Describe Tables. As far as I know, I used the correct table name.

DISCUSSION----------

Giving the table name alone is not enough. Always give BOTH the creator name and the table name when creating any view for DAL to use in the Describe Tables command.

With a license agreement between Apple Computer and ITI (Independence Technologies, Inc.), ITI will market DAL products and provide all support to DAL customers. To locate ITI's address and phone number, use ITI as a search string.

Article Change History:
31 Aug 1994 - Added ITI information.

DAL for VTAM Installation: The 'APPC=' Parameter

Revised: 1/21/93
Security: Everyone

DAL for VTAM Installation: The 'APPC=' Parameter

==========

Article Created: 4 January 1993

TOPIC ----------

In the VTAM APPL of the VTAM server, the "APPC=NO" parameter caused trouble (see page 5 of the MVS/VTAM Server Installation and Operation Guide). My understanding of the parameter is that if I need a LU 6.2 connection with the VTAM server, I should set this parameter to "APPC=YES".

That was what the system programmer did, when he installed the server. After hours of analyzing the installation, we found out that the DAL server didn't react to a CINIT from the host's SSCP.

When we changed back to the default "APPC=NO", it worked. What is the meaning of the parameter and its two values?

DISCUSSION ----------

The "APPC=" parameter specified in the Install Guide on page 5 should be set to "NO", because this parameter refers to whether the applid will support Independent LUs. Because VTAM, at the current release, and DAL (releases 1.3 and 1.3.5) do not support Independent LUs, set this parameter to "NO".

PrintMonitor: Where=80 and Why=-50 Error Messages (2/97)

Revised: 2/6/97
Security: Everyone

PrintMonitor: Where=80 and Why=-50 Error Messages (2/97)

==========

Article Created: 23 December 1992
Article Reviewed/Updated: 6 February 1997

TOPIC ----------

PrintMonitor displays an error dialog box that displays: Where = 80; Why = -50. How do I interpret these error codes, and how do I fix them?

DISCUSSION ----------

The "Where" errors are internal PrintMonitor debugging strings. There is currently no published table of these codes.

You can decode PrintMonitor error messages if you have a list of Macintosh system errors. The "why" (or y=) portion is the system error number. The system generated the "Why" Macintosh error code. Error code -50 is a file system paramErr (error in user parameter list). You can usually resolve this by throwing away the PrintMonitor Documents folder, which is "Spool Folder", located in the System Folder. PrintMonitor recreates this folder the next time you print a document.

Article Change History:
06 Feb 1997 - Added actual spool folder name.

680x0: How It Transfers a 32-bit Operand Over a 16-bit Data Path

Revised: 12/23/92
Security: Everyone

680x0: How It Transfers a 32-bit Operand Over a 16-bit Data Path

==========

Article Created: 23 December 1992

TOPIC ----------

How does a Motorola microprocessor transfer a 32-bit operand over a 16-bit data path?

DISCUSSION ----------

The 68020 and its successors implement a full 32-bit architecture. The 680x0 has implemented 32-bit registers along with a 32-bit data and address buses. The processor supports a dynamic bus sizing mechanism that allows the processor to transfer operands to or from external devices while automatically determining the device path size on a cycle-by-cycle basis. The dynamic bus interface allows for a simple highly efficient access to devices of differing data path widths. In dealing with transfers, a "path" refers to the external data bus width at the slave device (memory, peripheral, etc.).

You can think of it this way: the 680x0 gives you enough room to build a four-lane highway (path) for the address bus and the data bus. It is up to the manufacturer (Apple) to decide how many lanes to build for each path. The cost (engineering time, logic board denisty, component cost, time to market, etc.) of the path goes up with each lane added. For example, Apple may decide to build a system that supports 32-bit address path and a 16-bit data path.

The processor allows operand transfers to or from 8-, 16-, and 32-bit paths by dynamically determining the path size during each bus cycle. For example, if the processor is executing an instruction that requires a 32-bit operand, it attempts to read 32 bits during the first bus cycle. If the path responds that it is 16 bits wide, the processor latches the 16 bits of valid data and runs another cycle to obtain the other 16 bits. An 8-bit path is handled similarly, but with four read cycles.

Macintosh Computers: Maximum and Minimum RAM Disk Size (7/96)

Revised: 7/22/96
Security: Everyone

Macintosh Computers: Maximum and Minimum RAM Disk Size (7/96)

==========

Article Created: 23 December 1992
Article Reviewed/Updated: 22 July 1996

TOPIC ----------

What are the minimum and maximum RAM disk sizes for Macintosh computers?

DISCUSSION ----------

Under System 7.5.2 and later, the minimum RAM disk size is 416K. Computers using earlier versions of System 7 can have a minimum RAM disk size of 192K.

The maximum size of the RAM disk is 256 MB. So, if your computer has more than 256 MB of physical RAM installed, you cannot allocate more than 256 MB to the RAM disk. Additionally, the maximum RAM disk size is based on the amount of installed RAM minus the memory required to run the system software. This amount varies depending on system software version.

A/UX: How to Set Up the Numeric Keypad for Use with vi

Revised: 1/15/93
Security: Everyone

A/UX: How to Set Up the Numeric Keypad for Use with vi

==========

Article Created: 4 January 1993

TOPIC ----------

I am using the vi editor to write scripts in the A/UX 3.0 command shell. I want to use the numeric keypad to enter numbers, but the numeric keypad sends command sequences or letters to the screen, instead of the numbers.

DISCUSSION ----------

When you invoke vi, it ALWAYS sets the numeric keypad to generate "application sequences" instead of "numeric sequences." There is, however, a workaround :

1) Bring up vi before doing any numeric keypad work.

2) From the Preferences menu in the CommandShell window, select "Active Window Settings..." (or do Command-E).

3) Select the Terminal Settings... dialog box.

4) Select the Keyboard icon from the left of the window, then select Numeric Sequences from Numeric Keypad Generates.

Macintosh Educational Software Guide in HyperCard Form

Revised: 12/21/92
Security: Everyone

Macintosh Educational Software Guide in HyperCard Form

==========

Article Created: 21 December 1992

TOPIC ----------

Is there a database I can use to search for educational software by on subject, age, and so on?

DISCUSSION ----------

The 1992 Macintosh Educational Software Guide is now available as a HyperCard stack on an 800K disk (the Guide is no longer available in printed form). It is an electronic guide to over 1,340 kindergarten through 12th grade educational software products for the Apple Macintosh.

This new format offers some great new capabilities. You can select products by publisher name, grade level, and subject area. The stack can also generate a letter requesting more information from the manufacturer.

Each product listing includes:
- product description
- publisher name, address, and phone number
- education pricing
- grade range
- system software requirements

The files are compressed. When you install the Guide on your hard disk, it becomes a 1.6MB HyperCard stack. The Guide works on all Macintosh computers and requires either HyperCard 2.1 or HyperCard Player 2.1.

To order, write:
Apple Computer, Inc.

Apple Scanners: Bundled Software Compatibility (8/96)

Revised: 8/7/96
Security: Everyone

Apple Scanners: Bundled Software Compatibility (8/96)

==========

Article Created: 12 December 1992
Article Reviewed/Updated: 07 August 1996

TOPIC ----------

This article discusses the compatibility of:
• the Apple Color OneScanner with output devices
• the Apple Color OneScanner with OCR software
• Ofoto 2.0 software with earlier Apple scanners

DISCUSSION ----------

ColorSync Software and Output Devices

The Apple Color OneScanner supports ColorSync, Apple's unique color matching software, providing accurate colors and tones. When used with the Macintosh Color Display and the Apple Color Printer, the Color OneScanner is part of a total color solution that assures consistent color from scanning to display and printing so that the original image looks like the printed document.

Optical Character Recognition Software

The Color OneScanner works well with third-party OCR software. OmniPage Professional's AnyPage technology dramatically enhances recognition for a wide variety of documents.

Earlier Apple Scanners

Ofoto 2.0 and the Scanner driver 3.0 are backward compatible with previous Apple scanners.

Ofoto 2.0 works with both the Apple Scanner (4-bit) and OneScanner (8-bit). Scanner driver 3.0 is compatible with previous versions.

Bundled Software Compatibility

Begin_Table

	Scanner			
Software	Apple Scanner	OneScanner	Color OneScanner	Color OneScanner 600/27
HyperScan 2.0.1	Yes	Yes	Yes	No
AppleScan 1.0.2	Yes	Yes	No	No
Ofoto 2.0.2	Yes	Yes	Yes	No
ColorSync	No	No	Yes	Yes
Scanner 3.0	No*	No*	Yes	No
Scanner 2.0	Yes	Yes	No	No
OneScanner Dispatcher SW	No	No	No	Yes

End_Table

* the Scanner 3.0 extension WILL work with the Apple Scanner and Apple OneScanner IF System 7 is being used. If System 6 is being used then you should use Scanner 2.0 with the Apple Scanner or Apple OneScanner.

AppleScan 1.0.2 and 32-Bit Addressing

The AppleScan application is not a 32-bit clean application. In order to use the Apple Scanner with any Macintosh Quadra/Centris AV or Power Macintosh Computer, you must upgrade to Ofoto 2.0.x from Light Source Inc., or use another compatible scanning application.

Article Change History:
07 Aug 1996 - Updated to include latest scanner and software.
31 May 1994 - Included all bundled software compatibility chart.

Color OneScanner: Description

Revised: 12/23/92
Security: Everyone

Color OneScanner: Description

==========

Article Created: 6 January 1993

TOPIC ----------

The Apple Color OneScanner is a 24-bit one-pass color flatbed scanner. It builds on the strengths of the grayscale OneScanner, while adding full color capabilities. It provides professional quality with one-button simplicity.

Software shipping with the Color OneScanner:
- Ofoto 2.0, an improved version of the scanning software from Light Source, Inc.
- ColorSync color-matching software.
- HyperScan 2.0.1, which makes it easy to scan into HyperCard.

The OneScanner accessory kit also includes a book called The Basics of Color Design.

DISCUSSION ----------

Hardware and Software

In size and shape, the Color OneScanner is almost identical to the original OneScanner, and the internal layout is similar.

The logic and mechanics, however, are all new. The Color OneScanner uses a Tri-linear CCD to capture eight bits each of red, green, and blue in one pass. A one-pass scanner samples all three colors at the same time, resulting in truer color and better registration than a scanner that makes separate passes for each primary color. It also allows image processing on the fly, resulting in faster scans and better user interaction during the scanning process.

The Apple Color OneScanner is designed from the ground up to take full

advantage of Apple's ColorSync technology. (A separate TIL article has details on color matching.)

The main logic board contains a specially designed Apple ASIC to perform color correction in hardware. The scanner's gamut (color range) closely resembles that of the Apple 14" RGB Display, making color matching easier.

The Color OneScanner can generate ColorSync profiles for printers, and Ofoto 2.0 makes full use of ColorSync to manage color -- making sure that the results match the original as closely as possible without user intervention.

Features

- Simplicity
  - One-button fast-pass scanning
  - Balloon Help
  - Powerful yet easy-to-use rotation, selection, and scaling tools

- Image quality
  - Selectable 75- to 1200-dpi scanning resolution
  - Three optical sensors precisely aligned for excellent color registration
  - Works with ColorSync for accurate, sharp colors
  - Includes Ofoto software for clear, sharp images

- Versatility
  - Scans documents up to 8.5 x 14 inches
  - User-controlled scanning or Autoscan
  - Choice of resolution: 75, 150, 300, 600, or 1,200 dpi

- Compatibility
  - Compatible with all Macintosh computers with 68020 processor or greater
  - Compatible with most Macintosh applications, including word processing, presentation, graphics, database, and page-layout programs
  - PICT, TIFF, and EPS file formats

Color OneScanner: Hardware Specifications

Revised: 12/23/92
Security: Everyone

Color OneScanner: Hardware Specifications

==========

Article Created: 6 January 1993

TOPIC ----------

This article provides the technical specifications for the Apple Color OneScanner.

DISCUSSION ----------

General

- Scanner type: flatbed
- Registration: three 300-dpi CCDs
- Color matching:
  - color-correcting ASIC
  - ColorSync software
- Maximum document size: 8.5 x 14 in.
- Scaling: unlimited
- Interface: SCSI (Small Computer Systems Interface)

Power Supply

There will be two different versions of the Color OneScanner, each with a different power supply:

- Scanners shipped to the U.S. will have a 110 V non-switchable power supply.
- Units shipped to other countries will have a switchable universal power supply.

Power Requirements

- Line voltage (U.S. and Canada): 120 V AC ± 10%
- Line voltage (universal): 100/120/200/220/240 V AC ± 10%
- Frequency (U.S. and Canada): 58 to 62 Hz

- Frequency (universal): 48 to 62 Hz
- Power (standby): 22 W maximum
- Power (scanning): 45 W maximum

Operating Environment

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: –40° to 117° F (–40° to 47° C)
- Relative humidity: 5% to 95% noncondensing
- Altitude: 0 to 10,000 ft. (0 to 3,048 m)

Dimensions and Weight

- Height: 4.3 in. (11.0 cm)
- Width: 13.4 in. (34.0 cm)
- Depth: 21.5 in. (54.5 cm)
- Weight: 23.0 lb. (10.45 kg)

System Requirements

- Macintosh System software version 7.0 or later
- HyperCard 2.0 (to use HyperScan 2.0.1)
- Appropriate SCSI cabling

Color OneScanner: Software Specifications

Revised: 12/23/92
Security: Everyone

Color OneScanner: Software Specifications

==========

Article Created: 6 January 1993

TOPIC ----------

This article provides specifications of the software included with the Apple Color OneScanner.

DISCUSSION ----------

Ofoto

- Version number: 2.0
- Autoscan for setting all parameters, selecting, and straightening images.
- Selection and scaling tools for enlarging and reducing an image.
- Selectable 75- to 1200-dpi scanning resolution (software interpolation used for greater than 300-dpi resolution).
- Virtual imaging system to accommodate large image files by expanding system memory with hard disk space.
- Adaptive Calibration can tune Ofoto software to the capabilities of the printer or process used.
- High-quality rotation and scaling for image manipulation without loss of quality.
- Balloon Help.
- Works with PICT, TIFF, and EPS file formats.

ColorSync

- Matches colors from scanned input to display to printed output.
- Automatic, behind-the-scenes color matching.
- Works with color-capable Macintosh computers and color input and output devices that take advantage of ColorSync.

HyperScan 2.0.1

- Variable-size scanning to match the size of HyperCard 2.0 stacks.
- Controls on palettes for easy access.
- Built-in help.

Ofoto 2.0: Description

Revised: 12/23/92
Security: Everyone

Ofoto 2.0: Description

==========

Article Created: 6 January 1993

TOPIC ----------

Included with the Apple Color OneScanner is Ofoto 2.0 scanning software from Light Source, Inc. Ofoto 2.0 maintains the ease of use of the original Ofoto, while adding support for color functions and more automatic image processing.

DISCUSSION ----------

Ofoto automatically takes care of many of the traditional difficulties in scanning. Ofoto automatically calibrates each scan for a given display device or printer.

New Features

To the automatic features of Ofoto 1.0 (calibration, straightening, moire reduction), Ofoto 2.0 adds:

- Automatic sharpening
- Color cast correction
- Highlight/shadow adjustment

You can turn off these automatic features from the Image menu.

Automatic sharpening is included because most scanned color photographs lose some detail when printed. Sharpening preserves some of that detail. Ofoto's automatic sharpening is printer-dependent: it sharpens only as much as necessary for your chosen output device's resolution.

Color cast correction automatically removes a uniform color cast that is usually generated by the over- or under-exposure of the original photograph.

Highlight/shadow adjustment ensures that the highlights are as bright as possible and the shadows as dark as possible. Ofoto 2.0 adjusts the highlights and shadows to match the brightness range of the chosen output device.

Other Features

Ofoto contains the highest quality rotation and scaling algorithms of any commercially available scanning software.

Ofoto 2.0 supports image compression using QuickTime.

Ofoto 2.0 is fully integrated with ColorSync. You can use Ofoto and the Color OneScanner to generate a ColorSync profile for any printer.

Ofoto 2.0 allows scanning and processing in the background so that the user can do other things with the Macintosh while the scan process goes on. Many of Ofoto 2.0's functions work even if no scanner is attached.

Ofoto 2.0 supports AppleEvent interfaces for scanning and other basic functions. It is now possible for an OCR or image processing application to use Ofoto as its high-quality scanning front-end. The application simply requests an image with certain settings, and Ofoto delivers it. You only have to place the document on the scanner.

AppleShare: Inherited Privileges Problem (2/96)

Revised: 2/8/96
Security: Everyone

AppleShare: Inherited Privileges Problem (2/96)

==========

Article Created: 4 January 1993
Article Reviewed/Updated: 8 February 1996

TOPIC ----------

The "Inherited Privileges" feature of AppleShare version 3.0 and 3.0.1, 4.0, 4.0.x, 4.1, and Pro does not seem to work properly. Sometimes, privileges are inherited, and sometimes they are not.

DISCUSSION ----------

If you are experiencing this problem, you should upgrade to AppleShare 4.2 and then follow the solution outlined in this article, see "The Fix" section. After following one of the procedures provided, you should no longer experience this problem.

NOTE: AppleShare 4.2 is supported only on NuBus equipped PowerPC-based Power Macintosh and Workgroup Server computers. AppleShare 4.2 will not be available as a stand-alone product, it will only be sold with Workgroup Server bundles and upgrades from AppleShare 4.x.

What is the Inherited Privileges Problem

This is a problem that affects AppleShare version 3.0 and greater, including AppleShare 4.1 and Pro.

The symptoms are: when users logged on to the server and create a new folder within an existing folder on the server, the access privileges of the new folder do not inherit the privileges of the parent folder.

The "owner" is the user that created the folder. The name in "user/group" is the same as that of the parent, but only "owner" has check marks under See Folders/See Files/Make Changes (User/Group and Everyone does not have any check marks here).

What Causes This To Happen

The most common cause is one of the following actions:

Administrator Changes The Access Privileges

The Administrator changes the access privileges to a folder in AppleShare Admin, and selects the option Change All Enclosed Folders. This feature sets all enclosed folders with the same privileges as the parent folder. After making this selection and clicking Save, a dialog box asks you to select Inherit or Explicit privileges for the enclosed folders.

It is when the Administrator selects Inherit that the problem occurs. Each enclosed folder has the Same as enclosing folder feature turned on, and each folder created within this folder does not properly inherit the privileges of the parent.

Administrator Selects "Compact Access Privileges"

The Administrator selects Compact Access Privileges for the entire volume. This is a command within the AppleShare Admin program that lets you compact your access privileges (stored in AppleShare PDS file), by seeing which folders have the same exact privileges of its parent, and setting that folder's privileges to Same as enclosing folder.

Again, the problem in AppleShare software prevents folders created within these folders to not properly inherit the privileges of the parent.

The Fix

Install AppleShare 4.2 and preform one the following procedures. If you do not have AppleShare 4.2, you can reverse the problem to some degree by doing one of the following:

Select The "Affected" Parent Folder

Select the "affected" parent folder in AppleShare Admin's Access Information Window, and again click on Change all enclosed folders. Then click Save. When prompted to change the enclosed folders to either Inherit or Explicit, select Explicit.

This returns all privileges to explicit, and any new folders created within properly inherit the privileges of the parent. Unfortunately, it also changes all enclosed folders to the privileges of the parent, which may or may not be a desired outcome.

Here are definitions for explicit and inherit access privileges:

Explicit - Retain access privileges regardless of the enclosing folder.
Inherit - Always change to reflect access privileges of enclosing folder.

From The AppleShare Admin's Access Information Window

From within AppleShare Admin's Access Information window, individually select the folders that have been set to Inherit privileges (these have the Same as enclosing folder checkbox selected). De-select the Same as Enclosing Folder option, and check the privileges. All folders created within this folder now correctly inherit these same privileges.

To Duplicate The Problem
==========

Step 1

Log on to an AppleShare 3.x server and create a folder named Level 1, with all privileges enabled for Owner and Everybody.

Step 2

Open the Level 1 folder and create two folders with the following names:

- Level 2/explicit
- Level 2/dynamic

Check the access privileges on both Level 2 folders; they should be the same as the Level 1 folder.

Step 3

Select the Level 2/dynamic folder and select the "Same as enclosing folder" option. Note that the access privileges selections become inactive (grayed out).

Step 4

Save the new privileges.

Step 5

Open the Level 2/explicit folder and create a new folder and check its access privileges. This folder has the same privileges as the Level 2/explicit and Level 1 folders.

Step 6

Open the Level 2/dynamic folder and create a new folder and check its access privileges. This folder allows all privileges to the owner but does not allow any privileges to anyone else.

Ofoto for Windows: Out of Memory Error in 16-bit Video

Revised: 12/22/92
Security: Everyone

Ofoto for Windows: Out of Memory Error in 16-bit Video

==========

Article Created: 22 December 1992

TOPIC ----------

Since I upgraded my 486-based PC to 16-bit video, I get an out of memory error when trying to run Ofoto for Windows. I tried to re-install Ofoto, but the installation crashes with a video driver error. When I returned to 8-bit operation, it worked OK.

DISCUSSION ----------

Ofoto for Windows runs only on systems with video displays running at 1 bit, 4 bits or 8 bits. It does not run at thousands or millions of colors.

Hard Drives: Partition Size and Missing Space Explained (2/95)

Revised: 2/20/95
Security: Everyone

Hard Drives: Partition Size and Missing Space Explained (2/95)

==========

Article Created: 12 January 1993
Article Reviewed/Updated: 20 February 1995

TOPIC----------

I have noticed that Apple hard drives format to a size short of rated capacity.

I examined a 120MB hard drive and found a partition with several megabytes of free space above the Apple's standard 110MB partition. Why is this?

Also, If I compare the partition size shown in HD Setup and the amount of hard disk space displayed in the Finder window , HD Setup shows about 2MB more space. Why is this?

DISCUSSION----------

Apple formats its hard drives of each size to have a standard partition size and leaves a free partition of varying size on the disk. Since Apple uses hard drive mechanisms from different vendors with varying physical sizes, the default format allocates the same amount of space for the Macintosh partition and all excess space becomes part of the free partition.

If, for example, you buy two identical systems, both show the same hard drive size instead of showing one Macintosh with a 79MB hard drive and the other showing 76MB. Apple did this to prevent different hard drive capacities on supposedly identical systems.

If you re-partition your Apple hard drive with HD Setup and you want to use a larger partition size than the standard Macintosh partition, you do not need to save any free space. (Apple does not endorse or support changing the partition size.) You may use the maximum Macintosh partition and the hard drive should operate properly.

WARNING! Re-partitioning a drive results in a complete loss of data.
Do not attempt to re-partition any drive without first doing
a complete backup of the data.

To access the unused space on an Apple hard drive, back up your drive completely, and verify that the backup was successful. Launch Apple HD SC Setup, and click Partition. If there's unused space, it will appear as gray space with the size to the left. An Apple 80 MB hard drive formatted with default partitioning has about 2 MB unused. This is done to standardize all 80 MB Apple hard disks.

To use this space, you must be willing to reformat the hard disk, so make sure you backup your drive. Follow these steps:

1) Start up using the Disk Tools disk.
2) Open Apple HD SC Setup.
3) Click Partition.
4) Select your main Macintosh volume and remove it (this wipes out all data!).
5) Click and drag from just below the driver partition all the way to the bottom.
6) Select Macintosh volume in the resulting dialog.

Once you partition and mount your hard drive, different utilities may report different drive sizes. As an example, if you use an 80MB drive formatted with HD SC Setup from Disk Tools 7.1, the default partition is approximately 76.3MB and the maximum size partition is about 80.1MB. When you look at the amount of disk space displayed in the Finder window, you see 75MB and 78.7MB free space available respectively, with about 70K used.

With a disk utility like the Norton Utilities Disk Editor, you can verify that all the hard drive space is accounted for. The directory structure for the hard drive (including the boot blocks, volume info block, extents tree header, extents b-tree, catalog tree header, catalog b-tree, and the Desktop DF and Desktop DB files) occupies about 1.3MB.

The Finder window displays only the disk space available to it (the partition size minus the directory structure) while the disk utility shows the full partition size. This accounts for the 1.3MB difference. Note that the Desktop files grow as the disk is used in order to store information such as the icons used by the new files.

Printing Kanji Characters (8/95)

Revised: 8/23/95
Security: Everyone

Printing Kanji Characters (8/95)

==========

Article Created: 23 December 1992
Article Review/Updated: 23 August 1995

TOPIC ----------

What's required for printing Kanji characters? Since the LaserWriter IINTX-J was designed specifically for KanjiTalk, is this the hardware requirement? If so, how do the LaserWriter IIf and IIg handle printing Kanji characters? Please explain how printing 2-byte character languages works with PostScript and TrueType.

DISCUSSION ----------

Two-byte character printing is very similar to printing one-byte Roman script. The main difference previously was in the printer used (LaserWriter IINTX-J) to print the extremely large character sets of the two-byte Asian languages (there are close to 7,000 Kanji characters). With the introduction of Kanji TrueType in KanjiTalk 6.2 and now KanjiTalk 7.1, the gap has narrowed since an NTX-J is no longer required for printing high quality Kanji characters.

Because of the sheer number of characters, a technology was needed to decrease the number of outlines required. Use of composite fonts became that technology, as it provided the facility to combine more than one font to create another. In the case of KanjiTalk (and similarly with the other Asian operating systems), a special printer controller board was created to handle the composite font outlines, and an external 40MB hard disk was used to store them. This set formed the LaserWriter IINTX-J printer.

The following sequence of events is exactly the same for printing one-byte fonts as two-byte fonts, except where the outlines are found, and how they are processed on the printer (as just explained with the LaserWriter IINTX-J). In rough outline form, the search is as follows:

1) Look for associated PostScript fonts in the printer ROM, font cache, or external hard disk.

2) If not found, then look for the downloadable PostScript font on the Macintosh.
3) If not found, then look for the TrueType outline font on the Macintosh.
4) Lastly, use the bitmap font on the Macintosh.

Again, the difference is that the PostScript outline fonts aren't present in the printer's ROM or the Macintosh; they're on the hard disk. If not found there, then the sequence of events continues as normal starting with step 3. When printing to a LaserWriter IIf or IIg, a Japanese font hard disk isn't available. The Kanji TrueType font gets downloaded to the printer. In the case that no corresponding outline font is found, then a bitmap of the screen font is used, resulting in fairly choppy output.

There are now a total of six Kanji TrueType fonts, two introduced initially with KanjiTalk 6.2, and four more with KanjiTalk 7.1. As with any TrueType font, printing isn't limited to laser printers, so you can print to QuickDraw printers such as the StyleWriter and ImageWriter with good results.

System 7: Performa Versions Compared (9/95)

==========

Article Created: 14 December 1992
Article Reviewed/Updated: 7 September 1995

TOPIC ----------

This article describes the progressive changes made to system software versions 7.0.1, 7.0.1P, 7.1, 7.1P, 7.1P1, 7.1P2, 7.1P3, 7.1P5, 7.1P6, and System 7.5.

DISCUSSION ----------

SYSTEM SOFTWARE VERSION 7.0.1

Here are the features of system software version 7.0.1 that 7.0 doesn't have:

Extensions (cdevs)

- Memory - Included RAM Disk, and updated virtual memory and RAM Cache to work with new RAM disk.
- Portable - Removed screen brightness and contrast sliders, and RAM disk.
- Brightness - A simple slider to control screen brightness.
- Network - Support for on-board Sonic Ethernet for the Quadra family.
- Battery - Updated to work with PowerBook family.
- Caps Lock - Indicator panel available only on PowerBooks.
- File Sharing - Internal file sharing buffer increased from 4K to 5K.
- Cache Switch - For Quadras to disable or enable 68040 cache.
- A/ROSE and DAL - 68040 compatibility changes.
- HD SC Setup - Format-time mode select change.

System File

- Operating System
  - Keyboard patch wakes up sleeping Macintosh Apple Keyboard II (Macintosh Classic) keyboards.
  - Support for 53C96 SCSI chip in Quadras and PowerBooks 140 and 170,

and for PowerBooks 140 and 170 power manager.
  - Minor changes to LocalTalk (for 68040), Gestalt 'Iram', 'ram', and 'kbd' selectors (for RAM disk), _hwPriv CPU cache management and dispatch routines, keyboard maps (for PowerBook).
  - Startup code can inhibit 68040 cache when Cache Switch cdev is set.
  - Bitmap system fonts marked purgeable.
- ToolBox
  - SANE performance improved via backpatching.
  - Disk Initialization Package prevents RAM disks from being formatted as MFS volumes.
  - Notification Manager calls IdleUpdate when NMInstall called (on portables) to wake the system.
  - Powerdown messages on Quadra 900 and RAM disk.
  - Support for Quadra and PowerBook sound hardware.
  - Backlight driver upgraded to work with PowerBook family.
  - SetHandleSize fixed for all 32-bit memory managers.

General

- Reduction in overall size of run time system heap.
- Installer script file revisions for new systems.

SYSTEM SOFTWARE VERSION 7.0.1P

System 7.0.1P is system software for the Performa 200 and 400. It's a modification of system software version 7.0.1 that makes changes to the Macintosh, simplifying the interface for new users. A control panel extension installs the system changes. This version uses the control panel portion of the file as a pseudo-Finder enhancement, for a push-button application launcher.

Here are the modifications:

- Generalized reference to the computer
  Instead of "About this Macintosh..." the Apple menu reads "About this Computer..." The window doesn't identify the specific model. Applications can use a Gestalt selector to determine whether 7.0.1P is running.
- Push-button program launching
  When a Performa starts up, the Launcher control panel opens on the desktop (like a small version of At Ease) with an icon for each installed application. You can launch an application with a single click.
- Layer hiding
  When launching an application, the Finder layer is hidden, giving the illusion that only one application is open at a time. Clicking on the desktop won't bring the Finder to the front. You can still switch applications through the Application menu.
- Default folders
  The internal disk on a Performa is configured with an Applications folder and a Documents folder on the desktop. The standard Save As dialog box is modified to always default to saving in the Documents folder. This keeps all documents together rather than with the

application that created them.
- Color default
  On color-capable Performas, the default Monitors setting is 8-bit color.
- Changes in desktop pattern
  A modified General control panel replaces the standard desktop pattern editor with a pop-up menu containing a variety of 16x16 desktop patterns.
- Includes At Ease 1.0
  Lets adults share the computer, and makes it easy for children to launch applications.
- Backup & Restore
  This provides an easy way to create a set of backup disks, and to restore the contents of the hard disk if necessary.

SYSTEM SOFTWARE VERSION 7.1

System software version 7.1 has the system enabler that supports the Macintosh IIvx and IIvi. It has the features described for 7.0.1 (minus DAL and SANE backpatching), with the following additions:

- WorldScript software
  This simplifies language script support.
- New control panels
  These allow customizing formats for dates, times, numbers, and text behavior (for example, sort and case conversion). Here's a list of the new control panels:

  - Date & Time
  - General Controls
  - Numbers
  - Text Control
  - PowerBook

- Improvements made by System 7 Tune-Up 1.1.1
  These improvements include resolving the problem of disappearing folders and files, and installing LaserWriter driver version 7.1.1.
- The QuickTime software extension
  This provides multimedia capability.
- Font folder
  This folder within the System Folder provides a single place to store all fonts.
- System Enablers
  These provide compatibility between Macintosh CPU hardware and system software. The Install Me First disk adds a software module, and not a whole new system.

SYSTEM SOFTWARE VERSION 7.1P

System software version 7.1P was created to support the Macintosh Performa 600 (but works with all Performa models). It has the features described for 7.1 and 7.0.1P, with the following exceptions:

- Includes Macintosh PC Exchange and the Apple IIe ProDOS extension.
- Removes Apple File Exchange.

SYSTEM SOFTWARE VERSION 7.1P1

System software version 7.1P1 supports all the Macintosh Performa models, and has all the features described for 7.1, 7.0.1P, and 7.1P with the following exceptions:

- Memory control panel
  The RAM disk memory could be set too high in version 7.1P. A change in the Memory control panel prevents this.
- Installs CD-ROM 4.0.2 and StyleWriter II drivers
- Pre-configures At Ease icons
  The application buttons appear automatically and don't require manual placement.
- System enabler modification
  There have been reports that the floppy drive sometimes won't eject disks. A modification to the system enabler corrects this.
- Minor interface changes
  There are a few cosmetic changes, like moving the Mouse Basics icon to the far left side of the screen.
- Serial driver for communications

SYSTEM SOFTWARE VERSION 7.1P2

System software version 7.1P2 supports all the Macintosh Performa models, and has all the features described for 7.1, 7.0.1P, 7.1P, and 7.1P1, with the following modifications:

- Eliminates the system freeze when you click on the sea horse in Mouse Practice. This was corrected by reducing the application preferred memory size from 5000K to 2500K.
- Allows setting Monitors control panel to any number of colors or black and white selection. The 7.1P1 version reset the system to 256 colors upon restart.
- Control panels "exercised" (opened and closed) during Custom Mac process

  Many control panels normally have compressed resources. This makes it easier to fit all the necessary files on system software floppy disks. Once a control panel is opened, the resources are decompressed, and then written back to disk decompressed. This process can take quite a bit of time (minutes, on a Performa 400), and is most visible with the Monitors control panel.

  If a user shuts down their system while the decompressed resources are being written back to disk, it can lead to problems. By providing users with control panels which already have decompressed resources, it should speed things up, reducing the risk that a customer might think something is wrong and want to shut down their system improperly.
- The Read Me document now very clearly provides information about

the importance of the proper shut down procedure.

SYSTEM SOFTWARE VERSION 7.1P3

System software version 7.1P3 supports all the Macintosh Performa models, and has all the features described for 7.1, 7.0.1P, 7.1P, 7.1P1, and 7.1P2 with the following modifications:

- Includes a Shut Down desk accessory to make it easier to shut down, no matter what application is open. User studies showed that many users were confused about having to "go to the Finder" in order to shut down.
- Detects, during the startup process, if an improper shut down occurred. If it occurs (dirty bit was set), a dialog warns to always shut down properly.
- Performa control panel provides System Folder protection, preventing the user from deleting, renaming, or removing items from the System Folder. This feature is on by default, but can be turned off via the Performa control panel.
- Performa Macintosh Basics provide detailed information about the importance of the proper shut down procedure.
- System and Finder version numbers changed to 7.1P3.
- FKEY 3 saves the PICT as a SimpleText file type instead of a TeachText file.
- Apple Restore 1.3 runs only if you start up with the Utilities disk. Provides additional room for error dialogs.
- Slight change in the patterns of General Controls 7.1P3.
- Launcher 2.0P version number change. Changed the icons for the Launcher Items folder and the Launcher. Finalized the About Box.
- Balloon help added to Performa 1.0. Replaced two check boxes for the documents saving options with three radio buttons in the Performa window. Performa control panel icon changed. Performa control panel checks for System 7.x before opening; if it detects a non-supported system, it passes an error to the Finder which displays a message. Displays an alert if Performa control panel is open even though INITs aren't properly installed.
- Finder Layer hiding, an extension in the Performa control panel, modified to never bring At Ease to the front. This solves problems where user launches a desk accessory from the Finder and is switched to At Ease when the desk accessory closes. Now it always goes back to the Finder.
- SimpleText 7.1P changed the minimum and preferred memory partition size from 256K to 512K to solve some problems with Photo CD and large images.

SYSTEM SOFTWARE VERSION 7.1P5

System software version 7.1P5 supports all the Macintosh Performa models, and has all the features described for 7.1, 7.0.1P, 7.1P, 7.1P1, 7.1P2, and 7.1P3 with the following modifications:

- Mouse Basics, Mouse Practice, Performa Basics, Sharing Your Computer, Why Back Up, 800-SOS-APPL, DOS Compatibility and Helpful Tips are

compressed using Application VISE 2.1.1. This results in the fulfillment kit fitting on eight disks plus the Utilities disk versus nine disks plus Utilities.
- An alias to AppleCD Audio Player is in the Apple Menu.
- Includes the latest LaserWriter 300 and StyleWriter II drivers.
- Apple Restore 1.3
  When Restore finishes (because all software is installed or the user quit early) the last dialog has a restart button instead of asking for the Utilities disk. This forces a restart, causing a rebuild of the desktop.
- Rolled in all Apple HD SC Setup 7.2.1 fixes.
- General controls 7.1P3 desktop default pattern is second instead of third pattern.
- Performa 1.0 fixed this bug: when saving a document in an open application with the Performa control panel window open, Performa preference settings reverted to saved settings.
- Cleaned up the "not shut down correctly" dialog in the shut down check, an extension in the Performa control panel.
- The standard file patch, an extension in the Performa control panel, now resolves aliases most of the time. When aliases don't resolve, an 'X' appears over the Performa icon during startup.
- Added a file icon for the desk accessory called Shut Down 1.0P.

SYSTEM SOFTWARE VERSION 7.1P6

System software version 7.1P6 supports all the Macintosh Performa models, and has all the features described for 7.1, 7.0.1P, 7.1P, 7.1P1, 7.1P2, and 7.1P3 with the following modifications:

- Backup Partition Software-automatically detects corrupted system folders
  When a bad System Folder is detected, the user is given the option to re-load another System Folder into their system.
- CD ROM Support-supports the AppleCD 300+, an all other Apple drives
- New Instructional Products Suite-adds a searchable hypertext glossary.
  It also provides paths for electronic as well as phone-based third party support.
- HyperCard 2.2 Player-Includes a number of HyperCard stacks to provide additional functionality, and supports sales of the HyperCard 2.2 development kit.
- Improved incorrect shut-down dialog.
- Improvements to Apple Backup and Apple Restore.
- Inclusion of the '040 cache switch-provides compatibility with certain '040 cache incompatible programs, such as the current version of Prodigy.
- Optimus Support
- Bug fixes to improve reliability.

System 7.5

System 7.5 is qualified for all 680x0 based Performa computers with at least 4MB of memory (8MB for PowerTalk or QuickDraw GX), and at least 8MB for any PowerPC based Performa computer (16MB for PowerTalk or QuickDraw GX).

SOFTWARE BUNDLE

The software bundle for the Performa 550 has dozens of updates including:

- ClarisWorks 2.1-Supports PowerTalk and has bug fixes
- ClarisWorks Education Sample files-Allows us to use this bundle for the Educator Advantage Program
- Mario Teaches Typing 1.3.1

Fixes crashing Performa bug and sound manager problems

- American Heritage Dictionary Font Fix
- Quicken 4 Release 6

Fixes recalculation and other bugs

- New ClarisWorks Tour
- To receive upgrade kits from Global Village has been revised to eliminate the confusing dialog box at install time.

This 694-0261 bundle is qualified to be used for the Marts/Catalog 410 and 466, and the CE/MM 460 and 475, the Performa 550 with the CD 300+. (M1982LL/A,M1985LL/A, M2156LL/A M1904LL/A, M2147LL/B) as well as the all Performa 570 series computers.

New bundles will be built at the end of February to support the rest of the Performa line. (M2157LL/A, M2154LL/A, M1981LL/A, M2155LL/A) In addition, these other bundles will have updated copies of Mavis Beacon Typing, DateBook Pro, TouchBase Pro, and DataViz translators.

Article Change History:

Apple Font Pack: Frequently Asked Questions (12/95)

==========

Apple Font Pack: Frequently Asked Questions (12/95)
Article Created: 23 December 1992
Article Reviewed/Updated: 1 December 1995

TOPIC ----------

This article presents the frequently asked questions (FAQ) on the Apple Font Pack.

DISCUSSION ----------

Question: The package says there are 43 fonts included, but I only count 35. Where are the other 8 fonts?

Answer: There aren't any missing fonts. The Apple Font Pack contains 43 TrueType fonts, even though only 35 font icons are on the Font Pack disks.

To conserve hard disk space, 8 of the fonts don't have files and icons. The system software generates these fonts using other fonts in the same family. The 8 fonts have designs that allow the system to produce them with good typographic quality results. The 8 fonts that have no font icons are:

- ITC Lubalin Graph Oblique (from ITC Lubalin Graph)
- ITC Lubalin Graph Bold Oblique (from ITC Lubalin Graph Bold)
- Helvetica Black Oblique (from Helvetica Black)
- Helvetica Compressed Oblique (from Helvetica Compressed)
- Avant Garde Italic (from Avant Garde)
- Avant Garde Bold Italic (from Avant Garde Bold)
- N Helvetica Narrow Italic (from Helvetica Narrow)
- N Helvetica Narrow Bold Italic (from Helvetica Narrow Bold)

The 35 fonts actually included are:

AGFA Division of Miles, Inc.
Delphian
Nadianne

Nadianne Bold
Oxford

Bigelow & Holmes, Inc.
Lucida Bright
Lucida Bright Bold
Lucida Bright Italic
Lucida Bright Bold Italic

Bitstream, Inc.
(all licensed to ITC)
ITC Garamond Narrow
ITC Garamond Narrow Bold
ITC Garamond Narrow Italic
ITC Garamond Narrow Bold Italic

Font Bureau, Inc.
Zeal

International Typeface Corporation
ITC Machine
ITC Lubalin Graph
ITC Lubalin Graph Bold

Linotype-Hell
Helvetica Black
Helvetica Compressed

Monotype Typography
Old English
Swing Bold
Onyx

14 From the LaserWriter Set
Avant Garde
Avant Garde Bold
Bookman
Bookman Bold
Bookman Italic
Bookman Bold Italic
N Helvetica Narrow
N Helvetica Narrow Bold
New Century Schlbk
New Century Schlbk Bold
New Century Schlbk Italic
New Century Schlbk Bold Italic
Zapf Dingbats
Zapf Chancery

Question: All I get is Courier when printing.

Answer: Turn on "Unlimited Downloadable Fonts" in the Page Setup Options

dialog.

Question: I just installed the Font Pack. Why is my printer so slow now?

Answer: Slower printing results when documents have several typefaces, and because TrueType fonts print at the highest possible resolution your printer allows.

Question: How do I make the special characters and the strike over characters with the Zeal font?

Answer: You can use the Key Caps desk accessory to view them. Or, refer to page 23 of the "Getting Started with Type" manual that came with your Font Pack.

Virtual Memory: The Resulting Total RAM and Hard Disk Speed

Revised: 1/4/93
Security: Everyone

Virtual Memory: The Resulting Total RAM and Hard Disk Speed

==========

Article Created: 23 December 1992

TOPIC ----------

Why does total RAM always equal virtual memory? What happens to the physical RAM on board?

Since virtual memory uses the hard disk, doesn't the speed go from nanoseconds to milliseconds?

DISCUSSION ----------

Total RAM and Virtual Memory

Virtual memory extends the available amount of memory beyond the limits of physical RAM. It uses a logical address space formed from:

- Main memory (physical RAM to keep portions of programs and data currently in use), and
- Secondary storage (such as a hard disk) to hold those portions currently not in use.

If an application needs a portion of memory (or page), the operating system loads the page(s) back into main memory, and swaps out the unused page(s) from main memory into secondary storage. This process occurs transparently through the use of the PMMU (Paged Memory Management Unit), and is called demand paging.

Total RAM equals virtual memory because of this scheme. Both physical RAM and secondary storage combine to make the total amount of "virtual" memory. But in reality only the currently used pages are in main memory.

Hard Disk Speed and Performance Using Virtual Memory

The speed does drop to milliseconds when accessing the hard disk. This is true only when the needed page(s) isn't in main memory, and the system must access it from secondary storage.

It's best to limit the amount of virtual memory to twice the size of physical RAM to eliminate excessive paging activity known as thrashing. As the ratio of virtual to physical RAM increases, performance may degrade respectively, depending on the behavior of the applications running. As the ratio decreases, performance will most likely increase.

PowerBook 100 External SuperDrive: Specifications

Revised: 5/31/94
Security: Everyone

PowerBook 100 External SuperDrive: Specifications

==========

Article Created: 23 December 1992
Article Reviewed/Updated: 27 August 1993

TOPIC ----------

This article gives technical specifications for the Macintosh HDI-20 External 1.4MB Floppy Disk Drive (PowerBook 100 External SuperDrive).

DISCUSSION ----------

Recording Media

- Disk diameter: 3.5 inches (9.0 cm)
- Recording surfaces: 2
- Tracks per inch: 135 (5.31 per mm)
- Number of cylinders: 80

Capacity

- Formatted data:
  1.4MB (MFM)
  800K (GCR)
  720K (MFM)
- Unformatted data: 1 or 2MB

Drive Characteristics

- Seek time (track-to-track): 3 milliseconds
- Settle time: 18 milliseconds
- Drive startup time: 800 milliseconds

Head Position Accuracy

- ± 30 micrometers

Interface

- Connects directly to the Macintosh PowerBook 100 HDI-20 floppy drive port, via the drive's attached interface cable.

Environment

- Operating temperature: 50 to 122° F (10 to 50° C)
- Relative humidity: 5% to 90% noncondensing
- Storage temperature: -40 to +149° F (-40 to +65° C)

System Requirements

- Macintosh PowerBook 100

Dimensions and Weight

- Height: 1.1 inches (28 mm)
- Width: 4.5 inches (115 mm)
- Depth: 7.0 inches (174 mm) not including attached interface cable
- Weight: 1.5 lb. (.68 kg)

Article Change History:
27 August 1993 - Revised storage temperature

ColorSync Software: Overview (6/95)

Revised: 6/14/95
Security: Everyone

ColorSync Software: Overview (6/95)

==========

Article Created: 6 January 1992
Article Reviewed/Updated: 14 June 1995

TOPIC ----------

This article provides an overview of the ColorSync software.

DISCUSSION ----------

ColorSync is an extension to QuickDraw. It facilitates color conversion from the color space (method of mathematically describing a color) of one device to the color space of another device. It does this while maintaining consistent visual representation. In simple terms, ColorSync displays and prints the same image that it scanned.

The Major Difficulties in Reproducing Color

The physics of color presents a technical barrier, since delivering colored light is very different from delivering colored ink. Colors are described in device-dependent terms:

- RGB (Red, Green, Blue) for monitors and most scanners
- CMYK (Cyan, Magenta, Yellow, and Black) for most printers

Device-dependent descriptions cause the same blend on one monitor to display a very different color on a different monitor. While it is possible to map an RGB value to a CMYK value for a given pair of devices, this is not a practical solution because changing the devices changes the mapping, and therefore the result.

Different devices (scanner, monitor, printer) have different capabilities in delivering color. A color possible on one device is not possible on another. Every device produces a different range of colors, or color gamut. The scanner, display, and printer each have a different color gamut. Colors that all three

devices can produce present no problem. But colors that only one or two devices can generate require color matching.

The perceived color given by a specific value of RGB for an individual monitor can vary. Any RGB to CMYK mapping is not accurate over time. The solution for this problem is commonly called calibration.

Colorsync Architecture

ColorSync is a system extension that provides color matching capabilities to the existing QuickDraw graphics model. It provides three important features:

System-Level Support for Color Matching

All applications and peripherals can take advantage of it. All applications and imaging peripherals use the same scheme for color matching.

Support for Existing Applications

Some existing applications get color-matched printing without waiting for revised applications. ColorSync provides some new calls that enable applications to match to the display as well. This completes the entire picture -- matched input, display, and output.

Opportunities for Third Parties to Add Value

ColorSync uses the Component Manager, which lets third-party developers add value to the color-matching system. This was developed in conjunction with QuickTime to link a series of Apple or third-party color management resources and utilities.

How Colorsync Solves Color Matching Problems

Device-Independent Color

ColorSync was developed to solve the problems related to device-dependent color such as RGB and CMYK. ColorSync attempts to consistently represent colors (visually very similar or identical) across the three color gamuts. ColorSync uses device profiles to determine what colors a device can display, print, or scan (device color gamut).

ColorSync translates the colors that the originating device created for an image into a device-independent, and human perception-based color space, CIE XYZ. From the CIE-XYZ color space, ColorSync then translates the image into the color space of the destination device.

ColorSync uses the Apple Color High-Resolution RGB monitor as the default system profile or space. If you have a different monitor, you should use the ColorSync profile for that monitor in order for ColorSync to work properly. The ColorSync

profile creates a device-independent color definition while maintaining compatibility with QuickDraw, which is RGB-based. You can select any monitor that has a profile installed.

Applications

There are three levels of ColorSync application support:

SUPPORT LEVEL	DESCRIPTION
Printing Fidelity	Making the standard Macintosh call, DrawPicture, enables matching the source image to the printer. Applications that support this call provide printing functionality without revision.
Display Fidelity	ColorSync can correct for the display if the source is a scanner or a different monitor. The ColorPicker shows two gamuts, and you can choose those available on the monitor and printer or other display.
Preview Function	ColorSync lets applications offer a preview function that indicates those colors not possible on a particular device. Users can check documents before printing.

Device Profiles and Drivers

ColorSync allows characterizations of each device in terms of the CIE XYZ color space. These characterizations are called profiles. This allows making comparisons between any pair of ColorSync devices in terms of the common space.

Color Matching with ColorSync CMMs (Color Matching Methods)

CMMs give the best possible match when the exact match is not available. ColorSync uses the device profiles to determine if a device can display or print a certain color. If a color is outside the color gamut of a device, ColorSync determines a best-match color within that device’s gamut. It uses a simple look-up table or an algorithmic calculation to do this. The table look-up method is much faster than the algorithmic method.

The algorithmic method gives better color matching, and offers four options:

OPTION	DESCRIPTION
Perceptual	This maintains perceptual differences. Colors are interpreted relative to the destination device's white point. This option is usually best for photographic scanned images.
Colorimetric	This maintains individual colors at the expense of their relative values. It is usually best for spot colors.
Saturation	This maintains the levels of color saturation. It

	sacrifices contrast to maintain color saturation. It is usually best for computer-generated graphics.
Faster Matching	This offers a good compromise between photographs and computer-generated images, and takes less time.

ColorSync attempts to provide a base level of color matching with the smallest possible memory footprint (about 70K). Some print jobs require higher quality color matching. More sophisticated color management schemes can replace ColorSync's color matching method and hook into ColorSync via the Component Manager. This process lets other color management products integrate into the system software via ColorSync.

ColorSync still translates the image's colors into the device-independent color space. However, ColorSync then calls the substituted color matching method to translate the image into the color space of the destination device.

Color Calibration

The ColorSync Color Management extensions support the calibration systems available from third-party developers (such as SuperMac, Radius, and Raster Ops). You can periodically update the profile to compensate for differences from the standard profile.

Apple Color Printer: Description (Discontinued)

Revised: 6/2/94
Security: Everyone

Apple Color Printer: Description (Discontinued)

==========

Article Created: 6 January 1993

TOPIC ----------

This article describes the Apple Color Printer.

DISCUSSION ----------

The Apple Color Printer offers high-quality print resolution, speed, and color matching on a wide range of paper sizes and types, including 11x17-inch paper.

The Apple Color Printer is integrated with ColorSync color-matching software. And at 360 dots-per-inch (dpi) print resolution, the Apple Color Printer offers 44 percent higher resolution than traditional 300-dpi printers.

The print speed of the Apple Color Printer is faster than comparable color printers. Setup, use, and maintenance are simple. There's a separate cartridge for black ink, as well as for cyan, magenta, and yellow. So you can print with high-quality black ink and replace cartridges individually. Until an environmentally safe waterfast ink is developed for the Apple Color Printer, Apple will continue to use water-resistant ink.

With the Apple Color Printer, you can print on:
- Letter-size
- Legal-size
- 11x17-inch
- A4 and A3 paper
- Envelopes
- Coated stock for highest quality
- Transparencies
- Plain paper

..TIL11156-Apple_Color_Printer-Description_Discontinued.pdf

The Apple Color Printer features a new print driver that gives you the ability to share printers across a network. And the Apple Color Printer comes with 64 TrueType fonts. It also supports Adobe Type 1 fonts when used in conjunction with Adobe Type Manager (ATM).

Product Features

- Print quality
  - 360 dpi
  - 65 screen lines per inch
  - Integrated with ColorSync for accurate color matching
- Ease of use
  - Fast, easy installation
  - Sealed, simple-to-replace ink cartridges
  - All print software easily installed
- Versatility
  - Allows printing on envelopes, U.S. letter, U.S. legal, 11x17-inch, A4, and A3 paper sizes
  - Landscape- and portrait-formatted documents
  - Comes with 64 fonts
  - Works with most Macintosh graphics formats, including bitmap, PICT, and TIFF
- Printer sharing
  - Can be shared by Macintosh users over a network (with password protection)

Ordering Information

- Apple Color Printer Order No. B1029LL/A includes:
  - Pre-installed ink cartridges
  - Sample paper and transparencies
  - Power cord
  - User's guide
  - Sample files
  - Limited warranty statement

- Consumables

Black ink cartridge	M6901G/A
Yellow ink cartridge	M6902G/A
Magenta ink cartridge	M6903G/A
Cyan ink cartridge	M6904G/A
Letter-size coated paper	T0546G/A
Legal-size coated paper	T0548G/A
11x17 coated paper	T0549G/A
A4 coated paper	T0545G/A
A3 coated paper	T0547G/A
Letter-size transparency	T0551G/A
A4 transparency	T0550G/A

Apple Color Printer: Specifications (Discontinued)

Revised: 6/2/94
Security: Everyone

Apple Color Printer: Specifications (Discontinued)

==========

Article Created: 6 January 1992
Article Reviewed/Changed: 21 March 1994

TOPIC ----------

This article gives the technical specifications for the Apple Color Printer (Order Number B1029LL/A).

DISCUSSION ----------

Print Engine

• Canon P691 Color Bubblejet

Print Quality

• 360 dpi in best mode
• 180 dpi in draft mode

Marking Engine

• Thermal ink jet

Interfaces

• 50-pin SCSI

Image Processing

• Via Macintosh CPU

Print Speed

• Up to 2 minutes per page black-and-white (actual speed varies with image

printed and computer used)
• Up to 3.5 minutes per page color (actual speed varies with image printed and computer used)

Imageable Area (Minimum Margins)

• U.S. letter: 0.34-inch left and right margins, 0.32-inch top margin, 0.26-inch bottom margin
• U.S. legal: 0.34-inch left and right margins, 0.32-inch top margin, 0.26-inch bottom margin
• Tabloid (11-inch x 17-inch): 0.20-inch left and right margins, 0.32-inch top margin, 0.26-inch bottom margin
• A4: 0.11-inch left and right margins, 0.32-inch top margin, 0.26-inch bottom margin
• A3: 0.20-inch left and right margins, 0.32-inch top margin, 0.26-inch bottom margin

Paper Sizes

• U.S. letter (8.5x11 inches)
• U.S. legal (8.5x14 inches)
• Tabloid (11x17 inches)
• #10 business envelopes (9.5x4.125 inches)
• A4 (8.3x11.7 inches)
• A3 (11.7x16.5 inches)

Print Materials

• For best results, Apple recommends coated paper for all paper sizes.
• Plain paper: 17-pound (64 g/m2) to 24-pound (90 g/m2)
• Most letterhead and colored stock
• Medium-weight photocopier labels
• #10 business envelopes (9.5x4.125 inches)
• Apple recommends Apple letter OHP and A4 OHP transparency film.

Paper Feed

• Automatic sheet feeder holds up to 100 sheets of 20-lb. (75 g/m2) paper or five envelopes.

Paper Tray

• Single tray accommodates all media

Paper Tray Capacity

• 100 sheets (letter, A4)
• 50 sheets (legal, 11x17 inches, A3)
• Five #10 business envelopes

Fonts Supported

• 64 TrueType fonts

Ink Cartridges

- Separate cartridges for cyan, magenta, yellow, and black
- 400- to 700-page life depending on percentage of page coverage
- Cartridge capacity: 30 grams

Print Head

- Approximately 100 million characters estimated print head life.

ColorSync Architecture

- Matches colors from scanned input to display to printed output
- Automatic, behind-the-scenes color matching
- Works with color-capable Macintosh computers and color input and output devices that take advantage of ColorSync

Cable

- DB-25 External SCSI Connector

System Requirements

- Any color-capable Macintosh personal computer with at least 4MB of RAM
- A hard disk drive
- System software version 7.0 or later

Power Requirements

- Line voltage: 120 VAC, RMS
- Frequency: 60 Hz
- Power: 30 W maximum

Operating Environment

- Operating temperature: 59° F to 86° F (15° C to 30° C)
- Storage temperature: –22° F to 140° F (–30° C to 60° C)
- Relative humidity: 10% to 95% noncondensing

Size and Weight

- Height (without output tray): 6.7 inches (16.9 cm)
- Width: 20.5 inches (52.0 cm)
- Depth (paper tray closed): 16 inches (41.0 cm)
- Weight: 22 lb. (10 kg)

SCSI Port Pinouts

Pin	Signal	Description
1	REQ~	Request
2	MSG~	Message

3	I/O~	Input/Output
4	RST~	SCSI Bus Reset
5	ACK~	Acknowledge
6	BSY~	Busy
7	GND	Ground
8	DB0~	Data bit 0
9	GND	Ground
10	DB3~	Data bit 3
11	DB5~	Data bit 5
12	DB6~	Data bit 6
13	DB7~	Data bit 7
14	GND	Ground
15	C/D~	Command/Data
16	GND	Ground
17	ATN~	Attention
18	GND	Ground
19	SEL~	Select
20	DBP~	Data parity
21	DB1~	Data bit 1
22	DB2~	Data bit 2
23	DB4~	Data bit 4
24	GND	Ground
25	TPWR	Terminator power

Apple Color Printer: Using the LCD Menu

Revised: 1/4/93
Security: Everyone

Apple Color Printer: Using the LCD Menu

==========

Article Created: 6 January 1993

TOPIC ----------

When you press the Apple Color Printer ON LINE button to turn off the green indicator light, you enter Menu mode. This article tells you how to use this LCD Menu.

DISCUSSION ----------

You can move back and forth through the Menu items using the < and > keys. Here are the top level Menu choices that you'll see:

- PRINTING MODE
- CLEANING
- SET PARAMETERS
- TEST PRINT
- DUMP MODE
- INTERFACE SELECT
- COUNTRY CODE
- NVRAM INITIALIZE
- MEDIA SELECT

The USER SETTING is available when you turn the power on, but before you send a print job. If you access Menu mode after sending a print job, SET PARAMETERS isn't available, and TEST PRINT - B is available in the TEST PRINT mode.

If you press the Enter button while any of these Menu items is displayed, you see the choices you have under that item. You can move back and forth through the choices in any Menu sublevel using the < and > keys. Press the Exit button to move up a level in the menu. Be aware that the printer driver may override the Menu selections.

..TIL11158-Apple_Color_Printer-Using_the_LCD_Menu.pdf

Here's a diagram that shows the items available at each Menu sublevel:

- PRINTING MODE
  - MODE-A Plain paper, envelopes, or coated paper
  - MODE-B Transparency
  - MODE-C For printing blacks twice as dark
  - MODE-D To reduce bleeding on graphics with plain paper. Increase print time considerably.
  - MODE-E High speed mode for drafts
- CLEANING
  - CLEANING-A Press ENTER to start cleaning. Clears head for clogged ink nozzles (15 seconds, .15 gram)
  - CLEANING-B If CLEANING-A doesn't work after 2-3 times, try B. It uses more ink and time (90 seconds, 2.0 grams).
- SET PARAMETER
  - COLOR
    - Black (parallel default)
    - Magenta
    - Cyan
    - Blue
    - Yellow
    - Red
    - Green
  - CHR.SPACING
    - 10 CPI (parallel default)
    - 12
    - 15
    - Proportional
  - PAGE LENGTH
    - PL=11 (parallel default)
    - PL=12
  - LINE LENGTH
    - LL=8 (PARALLEL DEFAULT)
    - LL=11
  - SELECT FONT
    - Roman (parallel default)
    - Sans Serif
    - Courier
  - CHARACTER TABLE
    - Graphics Table (parallel default)
    - Italic Table
    - Download Table
  - INTERNATIONAL
    - USA (parallel default)
    - France
    - Germany
    - England
    - Denmark1
    - Sweden
    - Italy
    - Spain1
    - Japan
    - Norway
    - DenmarkII

        - SpainII
        - Latin America
        - Korea
        - Legal
    - AUTO LF
        - AUTO LF OFF (parallel default)
        - AUTO LF ON
    - DC1/DC3
        - DC 1/3 ENABLE (parallel default)
        - DC 1/3 DISABLED
    - CR CODE
        - NOT PRINT (parallel default)
        - PRINT
- TEST PRINT
    - TEST PRINT A Gives current status of print (ROM, interface, and so on) as well as color grid.
    - NOZZLE CHECK Similar to StyleWriter
- DUMP MODE (switches the standard print mode to hexadecimal and the reverse)
    - DUMP OFF
    - DUMP ON
- INTERFACE SELECT
    - SCSI
        - ID# = 0
        - ID# = 1
        - ID# = 2
        - ID# = 3
        - ID# = 4
        - ID# = 5
        - ID# = 6
        - ID# = 7
    - PARALLEL
        - BSY TIMING
            - ACK-BSY-ACK
            - BSY-ACK
            - ACK-BSY [a]normal default for parallel)
        - ACK WIDTH
            - 0.5 MICRO (normal default for parallel)
            - 1 MICRO
            - 4 MICRO
            - 8 MICRO
- COUNTRY CODE (language used in menu and TEST PRINT A status print)
    - English
    - Danish
    - Dutch
    - Finnish
    - French
    - German
    - Italian
    - Japanese
    - Norwegian
    - Portuguese
    - Spanish

    - Swedish
- NVRAM INITIALIZE (resets printer to default settings)
    - INIT.NO
    - INIT.YES
- MEDIA SELECT
    - Normal Paper

Apple Color Printer: Cleaning Nozzles, Printing Test Pages 4/96

Revised: 4/17/96
Security: Everyone

Apple Color Printer: Cleaning Nozzles, Printing Test Pages 4/96

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 17 April 1996

TOPIC ----------

This article describes the Menu choices you have when you clean the nozzles and print test pages on the Apple Color Printer.

DISCUSSION ----------

Here's how to enter the Apple Color Printer's Menu:

Press the On Line button to turn off the green light. You can then move back and forth through the Menu items using the < and > keys. If you press the Enter button while any of these Menu items are displayed, you see the choices you have under that item. You can move back and forth through the choices in the Menu sublevels using the < and > keys. Press the Exit button to move up a level in the menu.

There are two different sets of cleaning choices available at each Menu sublevel, depending on whether the Apple Color Printer is in Normal or Service/Factory Mode.

These are the test print and cleaning choices available at each Menu sublevel in Normal Mode:

- TEST PRINT
  - TEST PRINT A Bubble jet head check pattern
  - TEST PRINT B Bubble jet head/main unit precision check pattern 1
    Note: Test Print B is only available after a print job is sent to the printer.
- CLEANING
  - CLEANING A Same as user CLEANING A
  - CLEANING B For checking ink passage pressure at factory

IMPORTANT:
The Service/Factory Mode Cleaning D uses large quanties of ink. Only use Cleaning D if the other cleaning methods fail to adequately clean the nozzle.

These are the cleaning choices available at each Menu sublevel in Service/Factory Mode:

- BLACK OFFSET
- CYAN OFFSET
- MAGENTA OFFSET
- YELLOW OFFSET
- DIRECTION OFFSET
- TEST PRINT
  - TEST PRINT A Bubble jet head check pattern
  - TEST PRINT B Bubble jet head/main unit precision check pattern 1
  - TEST PRINT C Printing Position check
  - TEST PRINT D Same as B, but pattern 2
  - HEAT RUN Printer mechanism check (paper feed and carriage driven without printing)
- CENTER HEAD Moves print head to center for removal You turn off the power to exit this mode.
- CLEANING
  - CLEANING A Same as user CLEANING A
  - CLEANING B For checking ink passage pressure at factory
  - CLEANING C For filling system with ink
  - CLEANING D FLUSHING raises the temperature of the print head, uses 3.5 grams of ink, and takes 4 minutes.

To enter the Service/Factory Mode, follow these steps:

1) Hold both arrow keys down and turn the power on.

2) When you see the first rectangle on the display, release the arrow keys and press the ON LINE key.

3) While holding the ON LINE key down, press the ENTER key twice and release all keys.

You will now be able to access the choices in the Service/Factory Menu.

Cleaning the Nozzles

If streaks or other unpleasant artifacts start appearing in printed documents, cleaning the nozzles may improve printing. The following control panel steps initiate the nozzle cleaning process:

1) Press the On Line button. The green light goes out.

2) Press the Menu button two times in succession to cycle through these displayed modes:

- Printing Mode
- Cleaning

3) Press the Enter button two times in succession to cycle through these displayed modes:
   - Cleaning-A
   - 08-Cleaning

   The cleaning process begins and completes in a few moments.
   When the cleaning is complete, the display shows Cleaning-A.

4) Press the On Line button. Display shows 00 Ready.

If problems persist after two or three uses of the Cleaning-A process, two other methods provide more thorough cleaning (and use a much larger quantity of ink). You can find more detailed instructions for Cleaning-B and Flushing functions in the "Apple Color Printer User's Guide."

Printing Test Pages

To print the Test Page A, follow these steps:

1) Press the On Line button. The green light goes out.

2) Press the Menu button three times to cycle through these displayed modes:
   - Printing Mode
   - Cleaning
   - Test Print

3) Press the Enter button twice to cycle through these displayed items:
   - Test Print-A
   - 01-Test Print

   The test page is printed. When the nozzle test is complete, the display shows Test Print-A.

4) Press the On Line button. Display shows 00 Ready.

To print Test Page B, follow these steps:

1) Press the On Line button. The green light goes out.

2) Press the Menu button three times to cycle through these displayed items:
   - Printing Mode
   - Cleaning
   - Test Print

3) Press the Enter button. Display shows Test Print-A.

4) Press the Menu button. Display shows Test Print B.

5) Press the Enter button. Display shows 01-Test Print.
   The test page is printed. When the page is printed, the display shows Test Print-B.

6) Press the On Line button. The display shows 00 Ready.

Note:
Test Print B is not available until a print job has been sent to the printer.

To print the Nozzle Check page, follow these steps:

1) Press the On Line button. The green light goes out.

2) Press the Menu button three times to cycle through these displayed items:
   • Printing Mode
   • Cleaning
   • Test Print

3) Press the Enter button. Display shows Test Print-A.

4) Press the Menu button twice to cycle through these displayed items:
   • Test Print B
   • Nozzle Check

5) Press the Enter button. Display shows 01-Test Print.
   The test page is printed. When the nozzle check is complete, the display shows Nozzle Check.

6) Press the On Line button. Display shows 00 Ready.

Article Change History
17 Apr 1996 - Changed article status and added caution message.
12 Apr 1993 - Revised to correct Service/Factory mode menu choices.

Apple Color Printer: Self-Maintenance Processes

Revised: 1/4/93
Security: Everyone

Apple Color Printer: Self-Maintenance Processes

==========

Article Created: 6 January 1993

TOPIC ----------

The Apple Color Printer implements several self-maintenance features. This article describes these processes.

DISCUSSION ----------

The Apple Color Printer uses low-ink sensors in each cartridge to warn when a cartridge has only 3 grams of ink remaining (each new cartridge contains 30 grams of ink). This warning takes the form of both a dialog from the Print Monitor and a message on the Apple Color Printer control panel. If a cartridge runs dry during a print job, you get notified and the print job continues when you install a fresh cartridge.

In addition to keeping track of cartridge ink level, the Apple Color Printer constantly protects, cleans, and tests its print nozzles. Whenever the printer is idle for at least 12 seconds, the printer caps the ink jet nozzles to prevent the ink from drying in the nozzles. Capping also prevents nozzle leakage and dust contamination.

The system cleaning function occurs after these events:
• Any time you turn on the printer.
• Whenever the printer has been on, but not used during a 24 hour period.
• Whenever you install a new cartridge.

It's also possible to manually start print head cleaning via the printer control panel. The cleaning function is controlled by the purge unit which opposes the print heads. The four step process consists of:

1) Capping
2) Pumping
3) Wiping

4) Ejecting extra ink.

During the capping function, a head cap covers the nozzles. The head cap also connects the ink passages of the print head with the purge unit. The purge unit ensures maintenance of the ink jet head unit.

The pumping function takes place when the printer draws ink from the capped bubble jet heads into the purge unit. While clearing the nozzles of impurities, the printer draws fresh ink from the ink subtank. It sends the purged ink into a waste ink absorber within the cartridge. The waste ink absorber consists of a high molecular polymer absorption sheet, and can absorb up to 30 grams of ink.

During the wiping phase of the head cleaning procedure, a head wiper wipes off the nozzle face plate. During the cleaning process, the carriage moves past the wiper (right to left) from the yellow head to the magenta head to the cyan head, and finally to the black head, cleaning away any excess ink drops and paper fiber in its path. The wiper extends 0.2 inches from the face of the purge unit. The cleaning sponge, which extends 0.12 inches out from the purge unit, completes the cleaning process, wiping away the ink impurities the head wiper missed. The cleaning sponge also clears away any excess ink collected on the nozzle faceplate after a long print. The sponge can wipe the head unit when the carriage passes by in either direction.

The printer activates the wiper and sponge at these intervals during a print job:

- Every 30 seconds during a print that lasts at least that long.
- Every time the carriage is returned.
- After printing 1,980 characters.
- As a page is ejected and just before the heads are capped.

Another periodic maintenance process fires ink from all nozzles (64 nozzles per cartridge) while they are capped. The nozzles are fired, not pumped. This process prevents both the nozzles from clogging with ink and the four print heads from mixing (for example, cyan ink slopping over onto the magenta head).

The maintenance firing takes place under the following conditions:

- Before a print job starting, if it's been less than 24 hours since the last print.
- If the internal temperature drops to 25° C or less, and it's been between 1 and 24 hours since the last print.
- When the paper is ejected after a print.
- After the head wiper wipes the head.

ColorSync: Interacting With Other Color Matching Systems

Revised: 1/4/93
Security: Everyone

ColorSync: Interacting With Other Color Matching Systems

==========

Article Created: 6 January 1993

TOPIC ----------

How does ColorSync interact with the other color matching systems on the market?

DISCUSSION ----------

QuickDraw GX

QuickDraw GX is Apple's imaging oriented system software platform designed to improve the baseline imaging functionality of the Macintosh. ColorSync color matching is just one part of the functionality that GX supports. GX supports the profiles, CMMs, and applications geared for ColorSync.

Adobe PostScript Level II

Apple and Adobe have worked to coordinate their color management efforts. Apple provides basic tools that are compatible with the PostScript level II color extensions. These tools are designed to facilitate color exchanges on the Macintosh platform for PostScript files. Future PostScript drivers will accommodate device profiles to support color matching. Of course, the utilities are designed so that PostScript isn't a requirement for using the new ColorSync extensions.

Pantone, Muncell, Toyo, and So On

These are device-dependent standards used in the printing world in lieu of a true color matching system. These schemes define colors based on a standard set of printed samples. It's possible for these vendors to specify their standard color samples in terms of the CIE XYZ values, thereby integrating them with ColorSync.

Apple Color Printer: How It Implements the CMYK Color System

Revised: 1/4/93
Security: Everyone

Apple Color Printer: How It Implements the CMYK Color System

==========

Article Created: 6 January 1993

TOPIC ----------

Scanners and displays typically use an RGB (red, green, blue) color system. Most printers function in the CMYK (cyan, magenta, yellow, black) color system. This article describes how the Apple Color Printer uses the CMYK color system.

DISCUSSION ----------

CMYK Compared to RGB

Light-emitting color devices generally use RGB, which is known as an additive color system. Fully combining saturated red, blue, and green achieves the absolute white point of an RGB device. Reflective media (like paper) generally use CMYK, which is known as a subtractive color system.

Fully combining saturated cyan, magenta, and yellow creates black (absorbs or subtracts all light, and reflects nothing). Saturation refers to a pure hue or a perceived pure color. A pure hue is 100% saturated. Adding white to a hue decreases the percentage of saturation.

The Apple Color Printer uses the CMYK color system to attain millions of colors. Mixing various combinations of cyan, magenta, and yellow creates any color. Mixing fully saturated cyan, magenta, and yellow creates black. To attain blacker blacks and conserve the ink supplies of the color cartridges, the Apple Color Printer uses a black ink cartridge in any situation where it needs black.

The Print Head

The Apple Color Printer uses a four-part print head with a separate set of 64 nozzles for each primary color: cyan, magenta, yellow, and black. The

nozzles are placed 1/360th of an inch apart. The separate color heads are placed 0.5 inches apart on the print head. The optimum operating temperature for the ink jet heads is about 36° C (84° F). The printer activates the nozzle heater when it detects a temperature less than 36° C. This keeps the nozzles at the optimum operating temperature. Each color operates in a manner similar to the single print head of the StyleWriter.

Ink is heated within a nozzle until a bubble forms within the nozzle. The ink within the nozzle heats enough to cause the bubble to explode, ejecting ink from the nozzle at a speed of 12 meters/second. When the ink is ejected, a vacuum is created within the nozzle. The vacuum draws ink from the head subtank to refill the nozzle (the subtank is prefilled from the cartridge).

The head prints when the carriage moves from left to right, with colors output in the order black, cyan, magenta, yellow. It creates colors other than cyan, magenta, yellow, and black by mixing colors on the paper. The inks aren't physically mixed. Because the dots are so small (1/360 inch), placing a cyan and yellow dot next to each other gives the appearance of a green dot. Colors nearby affect the appearance of another color, even when the samples are large and obvious. When the sample size is 1/360 inch, the eye sees a different color.

Generating Colors from CMYK

If the three colors were physically mixed, the printer could theoretically create 16.7 million colors. Because color differences are what the human eye perceives, it attains substantially less than 16.7 million discernibly different colors. The eye can realistically perceive about 3 million color differences when the colors are placed next to each other. Keeping the color samples apart from each other drops the number of discernible colors to about 7000.

Because it's impossible to perfectly mix the three primary colors in 1/360-inch dots, patterns or halftoning produces the effect of mixed color.

Addressing Individual Nozzles

The four logical print heads (one for each color) are physically located on the same print head. Each print head's 64 nozzles are addressed in four groups of sixteen. Heat group 1 controls every fourth nozzle on all four heads, as does Heat group 2, and so on.

There's a delay when addressing each of the heads, due to their physical separation of 0.5 inch. This same delay is necessary when addressing individual nozzles between the color heads. If it needs a magenta dot just below a cyan dot, the cyan nozzle must fire one timing cycle before the magenta head fires, to account for the 0.5 inch the print head must travel between the two actions.

A serial signal arrives at the print head for each color (that is, a specific color value for cyan). It then converts the signal to a parallel signal that addresses each of the color's 64 nozzles (actually only those nozzles that need to be fired for a certain color). That parallel signal

is then matrixed with the head heat signal, causing the proper nozzles to heat and fire.

Apple Color Printer: Printer Sharing

Revised: 1/4/93
Security: Everyone

Apple Color Printer: Printer Sharing

==========

Article Created: 6 January 1993

TOPIC ----------

The Apple Color Printer's GrayShare driver offers printer sharing even when the Apple Color Printer isn't connected to a network. You can "publish" the printer to other network users for remote use. You can implement activity logging and password protection, which allows the host computer to both monitor and limit printer use. This article tells you how to share the Apple Color Printer.

DISCUSSION ----------

Choosing the Apple Color Printer

To print to an Apple Color Printer:

1) Select the printer via the Chooser.

2) Once the Chooser dialog box appears and you select the Apple Color Printer icon, the "Connect to:" portion of the dialog lists "<SCSI>" as the choice. If the printer is set up for sharing, it's named and that name is listed instead of "<SCSI>".

3) Select "<SCSI>" and close the Chooser dialog box to begin using the Apple Color Printer.

If you wish to share the printer, you need to perform a few more operations.

Apple Color Printer Sharing Setup

To set up printer sharing:

1) Click the "Setup" button.

2) An "Apple Color Printer Sharing Setup" dialog box allows you to check the "Share this Printer" checkbox, and then type in a name for the printer. The name entered in this dialog box will be the name that network users see when they select the Apple Color Printer icon in their Choosers.

3) You may type in the password that remote users must know in order to use the printer. If you don't wish to use password protection, leave the password area blank.

4) Check the "Keep Log of Printer Usage" checkbox if you want to keep a journal of printer use.

Printer Sharing and the Host Computer

Printer sharing is an excellent feature, but the host computer will bear the burden of the print serving. The remote station images and spools the document quickly, but the host computer handles the actual printer spooling. If many computers frequently spool documents to a shared printer, it may be advantageous to have a dedicated computer sharing that printer.

ColorSync: How It Differs from Ofoto Calibration

Revised: 1/4/93
Security: Everyone

ColorSync: How It Differs from Ofoto Calibration

==========

Article Created: 6 January 1993

TOPIC ----------

What is the difference between Ofoto calibration and ColorSync matching?

DISCUSSION ----------

Ofoto provides a closed-loop device-to-device matching, whereas ColorSync provides device-independent matching. This means that Ofoto will work as long as the scan is printed on the intended device. ColorSync provides the best possible results no matter what the eventual device is.

ColorSync is available only for the Macintosh, and there isn't a Windows version.

ColorSync: Compatibility Issues

Revised: 4/22/93
Security: Everyone

ColorSync: Compatibility Issues

==========

Article Created: 6 January 1993

TOPIC ----------

This article gives some compatibility information about ColorSync.

DISCUSSION ----------

System Software

ColorSync is compatible with system software version 7.0 and later.

Application Software

Most applications will print using ColorSync, assuming that the driver takes advantage of ColorSync. Those applications that generate custom PostScript will have to be revised. To take advantage of some of the new features of ColorSync (that is, view the matched image on the display, preview, or do gamut matching) will require revisions to applications. Apple has worked with software developers to ensure adoption of ColorSync as quickly as possible.

Photo CD

ColorSync works with Photo CD, but not directly. Photo CD files are based on a proprietary color space called YCC. Apple wrote a QuickTime extension that converts these to RGB. Once these images are converted, ColorSync performs the necessary matching. The process is automatic and invisible to the user.

QuickDraw

QuickDraw GX incorporates the ColorSync technology directly, which means that developer and customer investments in ColorSync are preserved with

QuickDraw GX. Because QuickDraw GX incorporates a totally new graphics model, the color spaces supported by GX exceed the ColorSync implementation under today's QuickDraw. Many of these color spaces are device-independent, and are in addition to the RGB and CIE XYZ spaces that ColorSync supports.

ColorSync: RAM and Disk Space Used, Color Matching Speed

Revised: 1/4/93
Security: Everyone

ColorSync: RAM and Disk Space Used, Color Matching Speed

==========

Article Created: 6 January 1993

TOPIC ----------

How fast and efficient is the ColorSync Color Matching Method (CMM)?

DISCUSSION ----------

The goal for the default CMM was minimal size. The default CMM uses approximately 70K of RAM and disk space. Profiles are also small, taking less than 5K of disk space each.

The default CMM converts approximately 4K color pixels/second on a Macintosh IIci computer. This means that a 24-bit scan of a 3x5 image at 100 dpi takes about 40 seconds.

Other methods (Kodak's ColorSense and EFI's EFIColor) can use the Component Manager to provide excellent matching and good performance. But the ColorSync default CMM was designed to have a small memory footprint for mainstream users. The other matching methods are table-driven and become quite large to perform all of the functions such as preview, gamut checking, and perceptual, colorimetric, or saturation matching. Lookup tables are very fast, but require large amounts of memory for the separate tables for every device combination.

ColorSync: Licensing and Distribution

Revised: 1/4/93
Security: Everyone

ColorSync: Licensing and Distribution

==========

Article Created: 6 January 1993

TOPIC ----------

How does Apple distribute ColorSync, and who can obtain licensing?

DISCUSSION ----------

Apple will license ColorSync to third parties for incorporation in their products. Apple will also ship ColorSync software and the appropriate profiles with Apple color systems and peripherals. The first Apple products with ColorSync included are the Color OneScanner and the Apple Color Printer.

Apple will license ColorSync to competitive peripheral developers. Because Apple believes that color matching needs to provide users with color WYSIWYG, Apple licenses ColorSync to anyone who wishes to use it, including competing companies. We feel it's critical to have one standard color matching approach on the Macintosh, no matter who provides the peripheral device.

Apple Color Printer: Checking and Resetting the SCSI ID (9/95)

Revised: 9/21/95
Security: Everyone

Apple Color Printer: Checking and Resetting the SCSI ID (9/95)

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 21 September 1995

TOPIC ----------

This article explains how to check the SCSI ID on the Apple Color Printer, and change it, if needed.

DISCUSSION ----------

Since the Apple Color Printer is a SCSI device, it must be set to a unique SCSI ID that no other SCSI devices on the SCSI chain are using. Apple ships the Apple Color Printer from the factory with the SCSI ID set to four (4). If you already have a device on the SCSI chain set to ID 4, it is probably easier to change the ID on that device.

To change the SCSI ID of the Apple Color Printer, disconnect it from the computer and leave it turned on, then follow these steps:

Step 1

Press the On Line button. The green light goes out.

Step 2

Press the Menu button 5 successive times to cycle through the modes on the display:

- Printing Mode
- Cleaning
- Test Print
- Dump Mode
- Interface Select

Step 3

While in Interface Select mode, press the Enter button two times in succession to cycle through these displayed items:

- SCSI
- ID#=4

Step 4

- Pressing the Menu button increases the SCSI ID number by 1.
- Pressing the < button decreases the SCSI ID number by 1.

Select the ID number you want to set and press the Enter button.

Step 5

Press the On Line button to cycle the display through:

- SAVE NVRAM=YES
- 00 READY

This completes the ID number resetting.

Step 6

Turn off the printer and reconnect it to the computer.

Apple Color Printer: Software Requirements and Installation

Revised: 1/4/93
Security: Everyone

Apple Color Printer: Software Requirements and Installation

==========

Article Created: 6 January 1993

TOPIC ----------

This article tells you what software comes with the Apple Color Printer, and gives you tips on how to properly install it.

DISCUSSION ----------

Installation

The Apple Color Printer requires System software version 7.0 or later.

The Apple Color Printer's accessory kit contains five 800K disks, which hold the Installer, printer driver software, ColorSync, and TrueType fonts. The Installer places the driver, ColorSync, TrueType fonts, Chooser, Printer Share and the display profiles into the System Folder.

NOTE: Use the Chooser installed by the Apple Color Printer Installer.

An important piece of the Apple Color Printer software environment is a new Chooser that supports printer sharing. If you install System 7.1 or an earlier version of System 7 after installing Apple Color Printer software, it will overwrite the Apple Color Printer Chooser. It's important to reinstall the Apple Color Printer Chooser if this should occur.

Fonts

The following TrueType fonts are provided, on floppy disk, with the Apple Color Printer:

Avant Garde (4 styles)
Bookman (4 styles)
Courier (4 styles)

Helvetica (4 styles)
Helvetica Narrow (4 styles)
New Century Schoolbook (4 styles)
Palatino (4 styles)
Symbol (Symbol)
Times (4 styles)
Zapf Chancery
Zapf Dingbats
Chicago
Delphian
Garamond Narrow (4 styles)
Geneva
Helvetica Black (2 styles)
Helvetica Compressed (2 styles)
Lubalin Graph (4 styles)
Lucida Bright (4 styles)
Machine
Monaco
Nadianne (2 styles)
New York
Old English Text
Onyx
Oxford

RAM Speed and CPU Speed: How They're Related

Revised: 1/12/93
Security: Everyone

RAM Speed and CPU Speed: How They're Related

==========

Article Created: 23 December 1992

TOPIC ----------

How are RAM speed and CPU speed related?

DISCUSSION ----------

RAM and CPU speed are related by cycle time and wait states.

Cycle Time

Cycle time is the minimum time it takes the processor to "turn around," or complete execution of an instruction.

On a 25 MHz CPU, the clock generates 25,000,000 pulses per second. That is to say, each pulse comes every 1/25,000,000 second (or after 25,000,000 pulses, one second has elapsed).

One divided by 25,000,000 means each pulse lasts 40 nanoseconds (4.0 x 10 EE-8). So, if the processor were running at top speed, it could write a value to RAM, change it in one cycle, and rewrite it 40 nanoseconds later. In this system, the RAM would have to be able to respond within 40ns, or 40ns RAM. However, 40ns RAM is hard to make and expensive, so someone had the idea to let the processor go fast for everything else it does, but to slow down accesses to RAM.

Wait State

Thus was born the idea of the wait state, in which the processor spins its wheels for one, two, or more cycles, to give the RAM a chance to catch up. So in our mythical 25 MHz machine described above, one wait state would mean we could use plentiful and cheap 80ns RAM. Two wait states would permit 120ns RAM, and so on.

Some designs are easy, and use a fixed number of wait states -- but not the Macintosh. Depending on what activity is being done and whatever else is going on, the Macintosh can impose a variable number of wait states.

Generally, though, if you use the calculation above with recent designs, you can assume one wait state and get the RAM speed.

(1 divided by clock speed) x 2 = ___ ns)

Wait states are not free, however. While the processor is spinning its wheels, that fast CPU and support hardware you paid for is useless. For this reason, cache RAM, which is very fast, can be used to eliminate or reduce wait states to the processor, and then the cache controller is used to write to slower main RAM. Also, though this refers to writes, the same applies to reads.

PowerBook 100 External SuperDrive: Description (3/95)

Revised: 3/31/95
Security: Everyone

PowerBook 100 External SuperDrive: Description (3/95)

==========

Article Created: 23 December 23 1992
Article Reviewed/Updated: 31 March 1995

TOPIC -----

This article describes the optional external SuperDrive for the PowerBook 100.

DISCUSSION -----

The Macintosh PowerBook 100 uses an external low-profile 1.44MB floppy disk drive that is designed to operate from the +5 volts power output available through the computer's HDI-20 FDD port.

The face plate folds down to act as a prop for the front of the drive, and can be folded back up to cover the drive slot when the drive is not in use.

Although functionally the same as previous SuperDrives, this drive uses no motor to "pull" disks into the drive. They must be physically pushed in farther than with other drives.

The drive does feature a standard disk eject mechanism.

A separate Tech Info Library article provides technical specifications.

Apple Color Printer: Meanings of Messages and Indicator Lights

Revised: 1/4/93
Security: Everyone

Apple Color Printer: Meanings of Messages and Indicator Lights

==========

Article Created: 6 January 1993

TOPIC ----------

This article tells you what the lights and messages indicate about the Apple Color Printer.

DISCUSSION ----------

Lights

There are two lights on the Apple Color Printer control panel: Alarm, and On Line. This list describes what the lights indicate about the Apple Color Printer's status:

- Green On Line flashing: printer is printing.
- Both lights off: printer is off. Check power switch, cord outlet, and connections.
- Alarm light on steady: printer is either out of paper or paper has misfed. Check the control panel or computer display for further information on the printer's condition.

Messages

The following table shows the most common messages that you may encounter while using the Apple Color Printer:

Message	Possible Cause	Action
10 Check Paper	Printer is out of paper	Insert new paper
	Paper isn't inserted correctly	Adjust paper

12 Cover Open	Top cover is open	Close the cover
13 Check Paper	Paper jammed Printer is dirty	Clear the jam Clean the interior
14 No Ink Cart	One or more ink cartridges are incorrectly installed	Make sure ink cartridges are properly installed in the correct positions
16 No Black Ink	Black ink cartridge is empty	Replace the black ink cartridge
16 No Yellow Ink	Yellow ink cartridge is empty	Replace the yellow ink cartridge
16 No Magenta Ink	Magenta ink cartridge is empty	Replace the magenta ink cartridge
16 No Cyan Ink	Cyan ink cartridge is empty	Replace the cyan ink cartridge

Apple Color Printer: Software Compatibility

Revised: 1/4/93
Security: Everyone

Apple Color Printer: Software Compatibility

==========

Article Created: 6 January 1993

TOPIC ----------

This article gives information about compatibility of software with the Apple Color Printer.

DISCUSSION ----------

The Apple Color Printer requires system software version 7.0 or later. Similar to the TrueType format, with ATM installed on the Macintosh, Type 1 fonts are compatible with the Apple Color Printer.

Application Compatibility

The Apple Color Printer isn't equipped with an internal controller to drive the engine. The host Macintosh converts QuickDraw data into raster data (bitmapped) and sends it to the printer. Any application that supports the QuickDraw printing calls will be compatible with the Apple Color Printer.

Some applications, such as Adobe PhotoShop, have their own print dialogs and limited facility for color matching. The Color (or Options) button is still present and ColorSync can still be invoked for excellent color matching. But the situation is muddled by a Correct For Color Printing checkbox that produces poor results. That checkbox doesn't invoke ColorSync, and the resulting color matching is significantly different from ColorSync.

To invoke ColorSync, you must use the Color (or Options) button in the Print dialog without selecting any other application-specific color correction.

New Chooser and System 7 Installers

The Apple Color Printer needs the new Chooser to function properly.

If you install the Apple Color Printer software, and then install System 7.1 or an earlier version of System 7, the previous version of the Chooser overwrites the new Chooser that ships with the Apple Color Printer. If this occurs, drag the Apple Color Printer Chooser from the Install disk into the System Folder.

StyleWriter II: Paper Handling and Adjustments (7/95)

Revised: 7/26/95
Security: Everyone

StyleWriter II: Paper Handling and Adjustments (7/95)

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 26 July 1995

TOPIC ----------

This article discusses the StyleWriter II printer's paper handling and adjustments.

DISCUSSION ----------

Paper Handling

The StyleWriter II has an integral paper feed mechanism that provides accurate paper handling from envelope to legal size in paper weights of 16 to 24 lbs. The paper feeder tray can hold 100 (20 pound) sheets or 15 envelopes. If paper heavier than 20 lbs. is used, then the paper feeder tray supports fewer sheets. You can also print transparencies.

NOTE: No manual paper feed is provided.

Adjusting for Heavier Paper

Printing on materials that are heavier (thicker) than regular paper, including envelopes, transparencies, labels, and heavier paper, requires the two paper thickness levers be adjusted. One lever is next to the sheet feeder; the other is inside the printer, just above the ink cartridge.

• For normal paper, the paper thickness levers should be set to the "paper" setting (shown by the icon of a piece of paper with its corner turned down).

• To adjust the thickness levers for heavier paper, move both levers to the "envelope" setting (with the icon of an envelope).

StyleWriter II: Controls and Status Lights (4/95)

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 7 April 1995

TOPIC ----------

The StyleWriter II has a power button, two paper thickness levers, and two status lights. This article discussed the StyleWriter II's controls and status lights.

DISCUSSION ----------

Power Button

The Power button is located on the top center of the printer. You can turn the printer on or off by pressing down on the Power button. To print a test page, press and hold down the Power button for several seconds until the test page starts to print. Release the Power button when the test page begins to print.

Paper Thickness Levers
